1 The adjective "bald" M. E. "balled" is usually explained as literally "round and smooth like a ball," but it may be connected with a stem bol, white or shining. The Greek ἄλοξ ἄλωξ certainly suggests some such derivation.

Alopecia areata is characterized by the development of round patches more or less completely denuded of hair. It is most commonly observed on the scalp, though it may occur on any part of the body where hair is naturally present. The patches are rounded, smooth and somewhat depressed owing to the loss of a large proportion of the follicles. At the margin of the patches short broken hairs are usually to be seen. Clinical evidence is steadily accumulating to show that this disease may be transmitted. Organisms are invariably present, in some cases few in number, but in others very abundant and forming a continuous sheath round the hair. They were first described by Dr George Thin, who gave them the name of *Bacterium decalvans*. The disease must be distinguished from ringworm—especially the bald variety; but though this is at times somewhat difficult clinically, the use of the microscope leaves no room for doubt. It must be remembered that for patients under forty years of age, the bald patches will generally disappear and, though treatment undoubtedly hastens recovery. After forty every year added to the patient’s age makes the prognosis less good. The general hygiene and mode of life of the sufferer must be very carefully attended to, and any weakness suitably treated. The following lotion should be applied daily to the affected parts, at first cautiously, later more vigorously, and in stronger solution:

| Ac. lactic 5i—3i; | Ol. ricini 3i; | Spt. vini ad 3iv. |

The loss of hair following acute fevers must be treated by keeping the hair short, applying stimulating lotions to the scalp, and attending to the general hygiene of the patient.

**Baldovinetti, Alessio** (1427–1490), Florentine painter, was born on the 14th of October 1427, and died on the 29th of August 1490. He was a follower of the group of scientific realists and naturalists in art which included Andrea del Castagno, Paolo Uccello and Domenico Veneziano, the influence of the last-named master being particularly manifest in his work. Tradition, probable in itself though not attested by contemporary records, says that he assisted in the decorations of the chapel of S. Egidio in S. Frediano, Florence, 1457, and in the choir of S. Croce, 1458, both by Domenico Veneziano and in conjunction with Andrea del Castagno. That he was commissioned to complete the series at a later date (1460) is certain. In 1462 Alessio was employed to paint the great fresco of the Annunciation in the cloister of the Annunciata, which still exists in ruined condition. The remains as we see them give evidence of the artist’s power both of imitating natural detail with minute fidelity and of spacing his figures in a landscape with a large sense of air and distance; and they amply verify two separate statements of Vasari concerning him: that “he delighted in drawing landscapes from nature exactly as they are, whence we see in his paintings rivers, bridges, rocks, plants, fruits, roads, fields, cities, exercise-gounds, and an infinity of other such things,” and that he was an inveterate experimentalist in technical matters. His favourite method in wall-painting was to lay in his compositions in fresco and finish them a secco with a mixture of yolk of egg and liquid varnish. This, says Vasari, was with the view of protecting the painting from damp; but in course of time the parts executed with this vehicle scaled away so that the great secret he hoped would prevent any such failure. In 1463 he furnished a cartoon of the Nativity, which was executed in tarsia by Giuliano de Maiano in the sacristy of the cathedral and still exists. From 1466 date the groups of four Evangelists and four Fathers of the Church in fresco, together with the Annunciation on an oblong panel, which still decorate the Portuguese chapel in the church of S. Miniato, and are given in error by Vasari to Pietro Pollaiuolo. A fresco of the risen Christ between angels inside a Holy Sepulchre in the chapel of the Rucellai family, also still existing, belongs to 1457. In 1471 Alessio undertook important works for the church of Sta Trinità on the commission of Bongianni Gianfigliozzi. First, to paint an altar-piece of the
BALDRIC—BALDWIN I.

Virgin and Child with six saints; this was finished in 1472 and is now in the Academy at Florence: next, a series of frescoes from the Old Testament, which was to be completed according to contract within five years, but actually remained on hand for fully sixteen. In 1497 the finished series, which contained many portraits of leading Florentine citizens, was valued at a thousand florins by a committee consisting of Cosimo Roselli, Benozzo Gozzoli, Perugino and Filippino Lippi; only some defaced fragments of it now remain. Meanwhile Alessio had been much occupied with other technical pursuits and researches apart from painting. He was regarded by his contemporaries as the one craftsman who had rediscovered and fully understood the long disused art of mosaic, and was employed accordingly between 1481 and 1483 to repair the mosaics over the door of the church of S. Miniatii, as well as several of those both within and without the baptistery of the cathedral.

These are the recorded and datable works of the master; others attributed to him on good and sufficient internal evidences are as follows:—A small panel in the Florence Academy, with the three subjects of the Baptism, the Marriage of Cana and the Transformation; this was long attributed to Fra Angelico, but is to all appearance early work of Baldovinetti: an Annunciation in the Uffizi, formerly in the church of S. Giorgio; unmistakably by the master's hand though given by Vasari to Pesellino: several Madonnas of particularly fine and characteristic quality; in the collection of Madame André at Paris acquired direct from Baldovinetti himself as one of his pupils; a sixteenth-century copy of the Dukhâtel collection and now in the Louvre, a third in the possession of Mr Berenson at Florence. All these are executed with the determined patience and precision characteristic of Baldovinetti; two, those at the Louvre and in the André collection, are distinguished by beautiful landscape backgrounds; and all, but especially the example in the Louvre, add a peculiar and delicate charm to the quality of grave majesty which Alessio's works share with those of Piero della Francesca and others of Domenico Veneziano's following. They probably belong to the years 1460-1465. In the later of his preserved works, while there is no abatement of precise and laborious finish, we find beginning to prevail a certain harshness and commonness of type, and a lack of care for beauty in composition, the technical and scientific searcher seeming more and more to predominate over the artist.

BALDRIC (from O. Fr. baudrei, O. Ger. balderich, of doubtful origin; cognate with English “belt”), a belt worn over one shoulder, passing diagonally across the body and under the other arm, either as an ornament or a support for a sword, sable, &c.

BALDWINUS, JACOBUS, Italian jurist of the 13th century, was by birth a Bolognese, and is reputed to have been of a noble family. He was a pupil of Azio, and the master of Odofredus, of Hostiensis, and of Jacobus de Ravanius, the last of whom has the reputation of having first applied dialectical forms to legal science. His great fame as a professor of civil law at the university of Bologna caused Baldinus to be elected podestà of the city of Genoa, where he was entrusted with the reforms of the law of the republic. He died at Bologna in 1225, and has left behind him some treatises on procedure, the earliest of their kind.

BALDUS DE UBALDUS, PETRUS (1377-1406), Italian jurist, a member of the noble family of the Ubaldi (Baldeschi), was born at Perugia in 1347, and studied civil law there under Bartolus, being admitted to the degree of doctor of civil law at the early age of seventeen. Federicus Petrius of Siena is said to have been the master under whom he studied canon law. Upon his promotion to the doctorate he at once proceeded to Bologna, where he taught law for three years; after which he was advanced to a professorship at Perugia, where he remained for thirty-three years. He taught law subsequently at Pisa, at Florence, at Padua and at Pavia, at a time when the schools of law in those universities disputed the palm with the school of Bologna. He died at Pavia on the 28th of April 1406. The extant works of Baldus hardly bear out the great reputation which he acquired amongst his contemporaries, due partly to the active part he took in public affairs, and partly to the fame he acquired by his consultations, of which five volumes have been published (Frankfort, 1839). Baldus was the master of Pierre Roger de Beaufort, who became pope under the title of Gregory XI., and whose immediate successor, Urban VI., summoned Baldus to Rome to assist him by his consultations in 1380 against the anti-pope Clement VII. Cardinal de Zabarella and Paulus Castrensis were also amongst his pupils. His Commentary on the Liber Feudorum is considered to be one of the best of his works, which were unfortunately left by him for the most part in an incomplete state. His brothers Angelus (1328-1407) and Petrus (1335-1400) were of almost equal eminence with himself as jurists.

BALDWIN I. (d. 1205), emperor of Romania, count of Flanders and Hainaut, was one of the most prominent leaders of the fourth crusade, which resulted in the capture of Constantinople, the conquest of the greater part of the East Roman empire, and the foundation of the Latin empire of Romania. The imperial crown was offered to, and refused by, Henry Dandolo, doge of Venice. The choice then lay between Baldwin and Boniface of Montferrat. Baldwin was elected (9th of May 1204), and crowned a week later. He was young, gallant, pious and virtuous, one of the few who interpreted and observed his crusading vows strictly; the most popular leader in the host. The empire of Romania was organized on feudal principles; the emperor was feudal superior of the princes who received portions of the conquered territory. His own special portion consisted of Constantinople, the adjacent regions both on the European and the Asiatic side, along with some outlying districts, and several islands including Lemnos, Lesbos, Chios and Tenos.

The territories had still to be conquered; and first of all it was necessary to break the resistance of the Greeks in Thrace and secure Thessalonica. In this enterprise (summer of 1204) Baldwin came into collision with Boniface of Montferrat, the rival candidate for the empire, who was to receive a large territory in Macedonia with the title of king of Saloniki. He hoped to make himself quite independent of the empire, to do no homage for his kingdom, and he opposed Baldwin's proposal to march to Thessalonica. The antagonism between Flemings and Lombards aggravated the quarrel. Baldwin insisted on going to Thessalonica; Boniface laid siege to Hadrianople, where Baldwin had established a governor; civil war seemed inevitable. An agreement was effected by the efforts of Dandolo and the count of Blois. Boniface received Thessalonica as a fief from the emperor, and was appointed commander of the forces which were to march to the conquest of Greece.

During the following winter (1204-1205) the Franks prosecuted conquests in Bithynia, in which Henry, Baldwin's brother, took part. But in February the Greeks revolted in Thrace, relying on the assistance of John (Kaloyan), king of Bulgaria, whose overtures of alliance had been unwisey rejected by the emperor. The garrison of Hadrianople was expelled. Baldwin along with Dandolo, the count of Blois, and Marshal Villehardouin, the historian, marched to besiege that city. The Bulgarian king led to its relief an army which far outnumbered that of the crusaders. The Frank knights fought desperately, but were utterly defeated (14th of April 1205); the count of Blois was slain, and the emperor captured. For some time his fate was uncertain, and in the meanwhile Henry, his brother, assumed the regency. Not till the middle of July was it definitely ascertained that he was dead. It seems that he was at first treated well as a valuable hostage, but was sacrificed by the Bulgarian monarch in a sudden outburst of rage, perhaps in consequence of the revolt of Philippopolis, which passed into the hands of the Franks. One contemporary writer says that his hands and feet were cut off, and he was thrown into a valley where he died on the third day; but the manner of his death is obscure. King John himself wrote to Pope Innocent III. that he died in prison. His brother Henry was crowned emperor in August.

BALDWIN II. (1217-1273), emperor of Romania, was a younger
son of Yolande, sister of Baldwin I. Her husband, Peter of
Courtenay, was third emperor of Romania, and had been followed
by his son Robert, on whose death in 1228 the succession passed
Baldwin, a boy of ten years old. The barons chose John
of Brienne (titular king of Jerusalem) as emperor-regent for life;
Baldwin was to rule the Asiatic possessions of the empire when he
reached the age of twenty, to be married John’s daughter
Mary, and on John’s death to enjoy the full imperial sovereignty.
The marriage contract was carried out in 1234. Since the death
of the emperor Henry in 1216, the Latin empire had declined
and the Greek power advanced; and the hopes that John of
Brienne might restore it were disappointed. He died in 1257.
The realm which Baldwin governed was little more than
Constantinople. His financial situation was desperate, and his life
was chiefly occupied in begging at European courts. He went to
the West in 1236, visited Rome, France and Flanders, trying to
raise money and men to recover the lost territory of his realm.
His efforts met with success, and in 1240 he marched into
Constantinople (through Germany and Hungary) at the head of
a considerable army. Circumstances hindered him from accom-
plishing anything with this help, and in 1245 he travelled again
to the West, first to Italy and then to France, where he spent two
years. The empress Maria and Philip of Toucy governed during
his absence. He was happy to be able to get money from King
Louis IX. in exchange for relics. In 1249 he was with King Louis
at Damietta. The extremity of his financial straits reduced
him soon afterwards to handing over his own son Philip to
merchants as a pledge for loans of money. Louis IX. redeemed
the hostages. The rest of his inglorious reign was spent by Baldwin
in mendicant tours in western Europe. In 1261 Constantinople
was captured by Michael Palaeologus, and Baldwin’s rule came
to an end. He escaped in a Venetian galley to Negropont,
and then proceeded to Athens, thence to Apulia, finally to France.
As titular emperor, his rôle was still the same, to beg help from
the western powers. In 1267 he went to Italy; his hopes were
centred in Charles of Anjou. Charles seriously entertained the
idea of conquering Constantinople, though various complications
hindered him from realizing it. He made a definite bargain with
Baldwin to this intent (May 1267). During the next year Baldwin
and his son Philip lived on pensions from Charles. In
October 1273 Philip married Beatrice, daughter of Charles, at
Foggia. A few days later Baldwin died.

See authorities for BALDWIN I. above; also Norden, Das Papsttum
und Byzanz (Berlin 1903).

BALDWIN I., prince of Edessa (1098-1100), and first king of
Jerusalem (1100-1118), was the brother of Godfrey of Bouillon
( q.v.). He was originally a clerk in orders, and held several
precincts; but in 1096 he joined the first crusade, and accom-
panied his brother Godfrey as far as Racela in Asia Minor.
When Tancred left the leadership of the crusaders at Racela,
and left Baldwin, Baldwin followed partly for personal,
partly from the same political motives which animated Tancred.
He wrested Tarsus from Tancred’s grip (September 1097), and
left there a garrison of his own. After rejoining the main army
at Marash, he received an invitation from an Armenian named
Pakrad, and moved eastwards towards the Euphrates, where he
occupied Tell-bashir. Another invitation followed from Thoros
of Edessa; and to Edessa Baldwin came, first as protector, and
then, when Thoros was assassinated, as his successor (March
1098). For two years he ruled in Edessa (1098-1100), marrying
an Armenian wife, and acting generally as the intermediary
between the crusaders and the Armenians. During these two
years he was the most influential in maintaining his ground, and, bossing
against the Mahomedan powers by which he was surrounded, and
from which he won Samosata and Seruj (Sarogaria), and against
a conspiracy of his own subjects in 1098. At the end of 1099 he
visited Jerusalem along with Bohemund I.; but he returned to
Edessa in January 1100. On the death of Godfrey he was
summoned by a party in Jerusalem to succeed to his brother.
A lay reaction against the theocratic pretensions of Dagobert,
who was counting on Norman support, was responsible for
the summons; and in the strength of that reaction Baldwin was
able to become the first king of Jerusalem. He was crowned
on Christmas Day, 1100, by the patriarch himself; but the
struggle of church and state was not yet over, and in the spring
of 1101 Baldwin had Dagobert suspended by a papal legate,
while later in the year the two disagreed on the question of the
contribution to be made by the patriarch towards the defence
of the Holy Land. The struggle ended in the deposition
of Dagobert and the triumph of Baldwin (1102).

As Baldwin had secured the supremacy of the lay power in
Jerusalem, so he extended into a compact kingdom the poor
and struggling territories which he had succeeded. This he did
especially through the Italian prince, Bohemund of Antioch,
which supplied in return for the concession of a quarter in the
conquered towns, the instruments and the skill for a war of sieges,
in which the coast towns of Palestine were successively reduced.
Arsuf and Caesarea were captured in 1101; Acre in 1104;
Beirut and Sidon in 1110 (the latter with the aid of the Venetians
and Norwegians). Meanwhile Baldwin repelled in successive
years the attacks of the Egyptians (1102, 1103, 1105), and in
the latter years of his reign (1115-1118) he even pushed south-
ward at the expense of Egypt, penetrating as far as the Red Sea,
and planting an outpost at Monreal. In the north he had to
compose the dissensions of the Christian princes in Tripoli,
Antioch and Edessa (1109-1110), and to help them to maintain
their ground against the Mahomedan princes of N.E. Syria,
especially Maudud and Aksun-ur, amirs of Mosul. In this way
Baldwin was able to make himself into practical suzerain of the
three Christian principalities of the north, though the suzerainty
was, and always continued to be, somewhat nominal. In
1118 he died, after an expedition to Egypt, during which he captured
Farum and, as old Fuller says, “caught many fish, and his
clergy in eating them.”

Baldwin was one of the “adventurer princes” of the first
 crusade, and as such he stands alongside of Bohemund, Tancred
and Raymond. On the whole he was the most successful of his
class. By his defence of the lay power against a nascent theo-
cracy, and by his alliance with the Italian towns, he was the real
founder of the Latin kingdom of Jerusalem. Events worked for
him: he might never have come to the throne, unless Bohemund
had fallen into the hands of Danishmend; and the dissensions
among the Mahomedans alone made possible the subsequent
consolidation of his kingdom. But he had virtù as well as
fortuna; and on his tombstone it was written that he was “ a
second Judas Maccabaeus, whom Kedar and Egypt, Dan and
Damascus dreaded.” As king, he still retained something of
the clerk in the habit of his dress; but he was at the same
time a warrior so impetuous, as to be sometimes foolhardy,
and his policy was on the whole anti-clerical. He may be accused
of greed: his life was not chaste; and the two defects met in his
rejection of his Armenian wife and his marriage to the rich
adventurer Baldwin. But, as old Fuller says, on the holiest soil of
history, he gave his people a fatherland”; and Fulcher of
Chartres, his chaplain, who paints at the beginning of Baldwin’s
reign the terrors of the lonely band of Christians in the midst of
their foes, can celebrate at the end the formation of a new
nation in the East (qui progenies occidentales, non facti sumus
orientales)—an achievement which, so far as it was the work
of any one man, was the work of Baldwin I.

LITERATURE.—The Historia Hierosolymitana of Fulcher, who had
accompanied Baldwin as chaplain to Edessa, and had lived in
Jerusalem during his reign, is the primary authority for Baldwin’s career. There is a monograph on Baldwin by Wolff (König Baldwin I. von Jerusalem), and his reign is sketched in R. Röhricht’s Geschichte des Königreichs Jerusalem (Innsbruck, 1898) C. i.-v. (E. Br.)

Baldwin II., of war, the twice traders; and subsequent he II. Egyptian however, not des Nople Jerusalem 246 Ibn defeated received 1

Konigreichs I. hand II. is Jerusalem, Kharput 1

Eustace Tancred. In during 1109. Arnulf. was defeated by him king of Edessa, who had ruled with wisdom and vigour during the regency and was unwilling to lay down the reins of power. Baldwin originally planned a solemn coronation, as the sign of his emancipation. Dissuaded when he nevertheless wore his crown publicly in the church of the Sepulchre.

A struggle followed: in the issue, Baldwin agreed to leave his mother in possession of Jerusalem and Nablus, while he retained Acry and Tyre for himself. But he repented of the bargain; and a new struggle began, in which Baldwin recovered, after some fighting, the possession of his capital. From these internal dissensions Baldwin was now summoned to the north, to regulate anew the affairs of Antioch and also those of Tripoli, where the death of Count Raymund had thrown on his shoulders the cares of a second regency. On his return to Jerusalem he was successful in repelling an attack by an army of Turcomans; and his success encouraged him to attempt the siege of Ascalon in the spring of 1153. He was successful: the “bride of Syria,” which had all but become the property of the crusaders in 1109, but had since denied the arms of the Franks for half a century, became part of the kingdom of Jerusalem. From 1156 to 1158 Baldwin was occupied in hostilities with Nureddin. In 1156 he had to submit to a treaty which cut short his territories; in the winter of 1157-1158 he besiegéd and captured Harim, in the terpe below the road of the Franks; but he defeated the Nureddin himself. In the same year Baldwin married Theodora, a near relative of the East Roman emperor Manuel; while in 1159 he received a visit from Manuel himself at Antioch. The Latin king rode behind the Greek emperor, without any of the insignia of his dignity, at the entry into Antioch; but their relations were of the friendliest, and Manuel—as great a physician as he was a hunter—personally attended to Baldwin when the king was thrown from his horse in attempting to equal the emperor’s feats of horsemanship. In the same year Baldwin had to undertake the regency in Antioch once more, Raynald of Chatillon, the second husband of Constance, being captured in battle. Three years later he died (1162), without male issue, and was succeeded by his brother Amalric.

Baldwin III. was the first of the kings of Jerusalem who was a native of the soil of Palestine. His three predecessors had all been emigrants from the West. His reign also marks a new departure from another point of view. His predecessors had been men of a type half military, half clerical—at once hard fighters and sound churchmen. Baldwin was a man of a subtler type—a man capable of dealing with the intrigue of the court and with problems of law, and as such, suited for guiding the middle age of the kingdom, when the different qualities of his predecessors had been equally suited to find. Like his brother, Amalric I, he was a clerkly and studious king versed

Baldwin II. —Baldwin III.
Baldwin IV—Baldwin, Robert

247

in law, and ready to discuss points of dogma. In an excellent sketch of Baldwin's character (xvi. cii.), William of Tyre tells us that he spent his spare time reading and had a particular affection for history; that he was well skilled in the jus consuetudinarium of the kingdom (afterwards recorded by lawyers like John of Ibelin and Philip of Novara as "the assizes of Jerusalem"); and that he had the royal faculty for remembering faces, and could generally be trusted to address by name anybody whom he had once met, so that he was more popular with high and low than any of his predecessors. He had, William also reports, a gift of impromptu eloquence, and a faculty both for saying witty things pleasantly to other people's expense and for listening placidly to Witticisms directed against himself; while he was generous to excess without needing to make actions in order to support his generosity, and always respected the Church. If in his youth he had been prone to gambling, and before his marriage with Theodora had been somewhat lax in his morals, when he became a man he put away childish things; his married life was a shining example to his people and he was abstemious both in food and drink, holding that "excess in either was an incentive to the worst of crimes." When his enemy, Nureddin, was married to her, he died, "and the Franks have lost such a man as the world has not now in his like."

Literature.—William of Tyre is the great primary authority for his reign: Cinnamus and Ibn-al-athir (see Bibliography to the article Crusades) give the Byzantine and Mahomedan point of view. His reign is described by R. Röhrich, Geschichte des Königreichs Jerusalem (Innsbruck, 1898), C. xix.—xxi. (E. Br.)

Baldwin IV., the son of Amalric I. by his first wife Agnes, ruled in Jerusalem from 1174 to 1183, when he had his nephew Baldwin crowned in his stead. Educated by William of Tyre, Baldwin IV. came to the throne at the early age of thirteen; and thus the kingdom came under the regency of Raymond II. of Tripoli. Happily for the kingdom whose king was a child and a leper, the attention of Saladin was distracted for several years by an attempt to wrest from the sons of Nureddin the inheritance of their father—an attempt partially successful in 1174, but only finally realized in 1183. The problems of the reign of Baldwin IV. may be said to have been two—his sister Sibylla and the fiery Raynald of Chatillon, once prince of Antioch through marriage to Constance (1153-1159), then a captive for many years in the hands of the Mahomedans, and since 1176 lord of Krak (Kerak), to the east of the Dead Sea. Sibylla was the heiress of the kingdom; the problem of her marriage was important. Married first to William of Montferrat, to whom she bore a son, Baldwin, she was again married in 1180 to Guy of Lusignan; and dissensions between Sibylla and her husband on the one side, and Baldwin IV. on the other, troubled the latter years of his reign. Meanwhile Raynald of Krak took advantage of the position of his fortress, which lay on the great route of trade from Damascus and Egypt, to plunder the caravans (1182), and thus helped to precipitate the inevitable attack by Saladin. When the attack came, Guy of Lusignan was made regent by Baldwin IV., but he declined battle and he was consequently deposed both from his regency and from his right of succession, while Sibylla by her first husband was crowned king as Baldwin V. in 1183. For a time Baldwin IV. still continued to be active; but in 1184 he handed over the regency to Raynoud of Tripoli, and in 1185 he died.

Literature.—The narrative of William of Tyre concludes with Baldwin IV.'s transfer of the regency to Raynoud of Tripoli. R. Röhrich describes the reign of Baldwin IV. Gelehrtes Königreich Jerusalem (Innsbruck, 1898), C. xix.—xxi. (E. Br.)

Baldwin V., the son of Sibylla (daughter of Amalric I.) by her first husband, William of Montferrat, was the nominal king of Jerusalem from 1183 to 1186, under the regency of Raynoud of Tripoli. His reign is marked by the advent of Saladin and by dissensions between the government and Guy of Lusignan.

Baldwin, James Mark (1861—), American philosopher, was born at Columbia, S.C., and educated at Princeton and several German universities. He was professor of philosophy in the university of Toronto (1888), of psychology at Princeton (1893), and subsequently (1903) of philosophy and psychology in Johns Hopkins University. Prominent among experimental psychologists, he was one of the founders of the Psychological Review. In 1892 he was vice-president of the International Congress of Psychology held in London, and in 1897-1898 president of the American Psychological Association; he received a gold medal from the Royal Academy of Arts and Sciences of Denmark (1897), was honorary president of the International Congress of Criminal Anthropology held in Geneva in 1896, and was made an honorary D.Sc. of Oxford University. Apart from articles in the Psychological Review, he has written:—Handbook of Psychology (1890); translation of Ribot's German Psychology of To-day (1886); Elements of Psychology (1893); Social and Ethical Interpretations in Mental Development (1898); Story of the Mind (1898); Mental Development in the Child and the Race (1898): Thought and Things (London and New York, vol. 1, 1906). He also contributed largely to the Dictionary of Philosophy and Psychology (1901-1905), of which he was editor-in-chief.

Baldwin, Robert (1804-1858), Canadian statesman, was born at York (now Toronto) on the 12th of May 1804. His father, John Baldwin (d. 1844), went to Canada from Ireland in 1798; though a man of wealth and good family and a devoted member of the Church of England, he opposed the religious and political oligarchy which was then at the head of Canadian affairs, and brought up his son in the same principles. Robert Baldwin was called to the Bar in 1825, and entered into partnership with his father. In 1829 he was elected a member of the parliament of Upper Canada for the town of York, but was defeated in the following year and retired for a time into private life. During the next six years, he so constantly advocated a responsible executive as the one cure for the political and economic evils of the time that he was known as "the man of one idea." In 1836 he was called by Sir Francis Bond Head (1793-1875), the lieutenant-governor, to the executive council, but finding himself without influence, and compelled to countenance measures to which he was opposed, he resigned within a month. Though a reformer, he strongly disapproved of the rebellion of 1837-1838. On the union of the two Canadas he became (1841) a member of the executive council under Lord Sydenham, but soon resigned on the question of responsible government. In 1842 he formed the first Liberal administration, in connexion with Mr (afterwards Sir) L. H. Lafontaine, but resigned the next year, after a quarrel with the governor-general, Sir Charles Metcalfe, on a question of patronage, in which he felt that of responsible government to be involved. At the general election which followed, the governor-general was sustained by a narrow majority, but in 1848 the Liberals were again returned to power, and he and Mr Lafontaine formed their second administration under Lord Elgin and carried numerous important reforms, including the freeing from sectarian control of the Provincial University and the introduction into Upper Canada of an important municipal system.

Internal dissensions soon began to appear in the Liberal party, and in 1851 Mr Baldwin resigned. The special struggle leading to his resignation was an attempt to abolish the court of chancery of Upper Canada, whose constitution was due a new lease, introduced by Baldwin in 1849. The attempt, though defeated, had been supported by a majority of the representatives from Upper Canada, and Baldwin's fastidious conscience took it as a vote of want of confidence. A deeper reason was his inability to approve of the advanced views of the Radicals, or "Clear Grits," as they were to be called. On seeking re-election in York, he declined to give any pledge on the burning question of the Clergy Reserves and was defeated. In 1858 the Liberal-Conservative party, formed in 1854 by a coalition, attempted to bring him out as a candidate for the upper house, which was at this date elective, but though he had broken with the advanced reformers, he could not approve of the tactics of their opponents, and refused to stand. He died on the 9th of December 1858. Even those who most bitterly attacked his measures admitted the purity and unselfishness of his motives. After the concession of responsible government, he devoted himself to bringing about
a good understanding between the English and French-speaking inhabitants of Canada, and his memory is held as dear among the French Canadians as in his native province of Ontario.

BALE, JOHN (1495-1563), bishop of Ossory, English author, was born at Cove, near Dunwich in Suffolk, on the 21st of November 1595. At the age of twelve he entered the Carmelite monastery at Norwich, removing later to the house of “Holme,” probably the abbey of the Whitefriars at Hulne near Alnwick. Later he entered Jesus College, Cambridge, and took his degree of B.D. in 1529. At Cambridge he came under the influence of Cranmer and of Thomas Wentworth, 1st Baron Wentworth, and became an ardent partizan of the Reformers. He laid aside his monastic habit, and, as he himself puts it with characteristic brutality, “that I might never more serve so execrable a beast, I took to the worship of the Holy.” He obtained the living of Thornden, Suffolk, but in 1534 was summoned before the archbishop of York for a sermon against the invocation of saints preached at Doncaster, and afterwards before Stokesley, bishop of London, but he escaped punishment and the threat of expulsion. He was a fervent protestant who was afterwards called an unscrupulous controversialist, and in these plays he allows no considerations of decency to stand in the way of his denunciations of the monastic system and its supporters. The prayer of Infidelitas which opens the second act of his Three Laws (quoted by T. Warton, Hist. Eng. Poetry, sect. 41) is an example of the lengths to which he went in profane parody. These coarse and violent productions were well calculated to impress popular feeling, and no doubt Cromwell found in him an invaluable instrument. But on his patron’s fall in 1540 Bale fled with his wife and children to Germany. He returned on the accession of Edward VI. He received the living of Bisilopstoke, Hampshire, being promoted in 1552 to the Irish see of Ossory. He refused to be consecrated by the Roman rite, which still obtained in the Irish church, and won his point, though the dean of Dublin entered a protest against the revised office during the ceremony (see his Vocation of John Bale to the Bishoppery of Ossorie, Harl. Misc. vol. vii.). He pushed his Protestant propaganda in Ireland with no regard to expediency, and when the accession of Mary inaugurated a reaction in matters of religion it was with delight that he was safely out of the country. He tried to escape to Scotland, but on the voyage was captured by a Dutch man-of-war, which was driven by stress of weather to St. Ives in Cornwall. Bale was arrested on suspicion of treason, but soon released. At Dover he had another narrow escape, but he eventually made his way to Holland and thence to Frankfort and Basel. During his exile he devoted himself to writing. After his return, on the accession of Elizabeth, he received (1560) a prebendal stall at Canterbury. He died in November 1563 and was buried in the cathedral.

The scurrility and vehemence with which “foul-mouthed Bale,” as Wood calls him, attacked his enemies does not destroy the value of his contributions to literature, though his strong bias against Roman Catholic writers does detract from the critical value of his works. Of his mysteries and miracle plays only five have been preserved, but the titles of the others, quoted by himself in his Catalogus, show that they were animated by the same political and religious aims. The Three Laws of Nature, Moses and Christ, corrupted by the Sodomykes, Phases and Papytises most wicked (pr. 1558 and again 1559), were among his political plays. The direction for the dressing of the parts is instructive: “Lo! A tragedie; or entendre many-fest the chief promises of God unto Man . . . (1538, printed in Dod’s Old Plays, vol. i), The Temptacion of our Lorde (ed. A. B. Grosart in Miscellanea of the Fuller Worthies Library, vol. i, 1879), and A brefe Comedie or Entrelude of Johan Baptyastes preachynge in the Wylderness, &c. (Harl. Misc. vol. i) were all written in 1538. His plays are doggerel, but he is a figure of some drama. This book contains a specimen of the English historical drama. It does not appear to have directly influenced the creators of the chronicle histories. To the authors of the Troublesome Raigne of King John (1591) it was apparently unknown, but it is noteworthy that an attempt, however feeble, at historical drama was made fourteen years before the production of Gorboduc. Kyunge Johan (ed. J. P. Collier, Camden Soc. 1838) is itself a polemic against the Roman Catholic Church. King John is represented as the champion of English rites against the Roman see—

“This noble Kyunge Johan, as a faithful Muse, With stode prode Phrao for his poore Israel.”

But the English people remained in the bondage of Rome.—

“Tyll that duke Josue, whych was our late Kyne Henrie, Clerely brought us out in to the lande of mylke and honye.”

Elsewhere John is called a Lollard and accused of “heretycall langage,” and he is finally poisoned by a monk of Swinestead.

Allegorical characters are mixed with the real persons. Ynglone vidua, represents the nation, and the jocular element is provided by Sedwyson (sedition), who would have been the Vice in a modern play. In his plays Bale endeavours to make as many parts, for stage directions such as “Go out Ynglone, and dress for Clergy” are by no means uncommon. The MS. of Kyunge Johan was discovered between 1831 and 1838 among the corporation papers at Ipswich, where it was probably performed, for there are references to charitable foundations by King John in the town and neighbourhood. It is described at the end of the MS. as two plays, but there is no obvious division, the end of the first act alone being noted. The first part is corrected by Bale and the latter half is in his handwriting, but his name nowhere occurs. In the list of his works, however, he gives a play De Joanne Anglorum Rege, written in idiome materno.

But Bale’s most important work is Illustrium majoris Britanniae scriptorum, hoc est, Angliae, Cambrie, ac Scotiae Summariam . . . (Ipswich and Welge, for John Overton, 1548, 1549). This contained five centuries, but another edition, almost entirely rewritten and containing fourteen centuries, was printed at Basel with the title Scrittorum illustrium majoris Britanniae . . . Catalogus (1557-1559). The chronological catalogue of British authors and their works was partly founded on the Collectanea and Commentarii of John Leland, but Bale was an indefatigable collector of materials, and included many of the valuable libraries of the Augustinian and Carmelites houses before their dissolution. In his notebook he records as an instance of the wholesale destruction in progress: “I have bene also at Norwyche, our second citie of name, and there all the library monuments are turned to the use of their grossers, candelmakers, soperellers, and other worldly occupiers . . . As much have I saved there and in certen other places in Northfolke and Southfolke concerning the authors names and titles of their works, as I could, and as much wold I have done through out the whole realm, if I had beene able to have borne the charges, as I am not.” His work is therefore invaluable, in spite of the inaccuracies and the abuse lavished on Catholic writers, for it contains much information that would otherwise have been hopelessly lost.

A list of Bale’s works is to be found in Athenee Cantabrigienses (vol. i, pp. 227 et seq.). The reprints already mentioned, The Examinations of Lord Cobham, William Thorne and Anne Askew, &c., were edited by the Rev. H. Christmas for the Parker Society in 1849. Bale’s autograph note-book is preserved in the Selden Collection of the Bodleian Library, Oxford. It contains the note books of his productions catalogued by Dr. Draper and arranged alphabetically, with no attempt at ornament of any kind, and without the personalities which deface his completed work. He also gives in most cases the sources from which his information was derived. The book was prepared for publication with notes by Dr. R. Lane Poole, with the help of Miss Mary Batens, as Index Britanniae Scriptorum . . . colliget Joannes Baleus (Clarendon Press, 1902), forming part ix. of Anecdota Oxoniensia.

John Pits or Pitieus (1650-1656), an English Catholic exile, founded on Bale’s work his Relationum historiarum de rebus anglicis tomus primus (Paris, 1619), better known by its running title of
Inhabitants.—The islanders are a Spanish race, very closely akin to the Catalans; but the long period of Moorish rule has left its mark on their physical type and customs. In character they are industrious, and hospitable, and pique themselves on their loyalty and orthodoxy. Crime is rare. There are higher schools in the principal towns, and the standard of primary education is well up to the average of Spain. Vaccination is common except in the cities,—the women often performing the operation themselves when medical assistance cannot be got. Castilian is spoken by the upper and commercial classes; the lower and agricultural employ a dialect resembling that of the Catalans.

Commerce.—Fruit, grain, wine and oil are produced in the islands, and there is an active trade with Barcelona in fresh fish, including large quantities of lobsters. Shoemaking is one of the most prosperous industries. There is not a very active trade direct with foreign countries, as the principal imports—cotton, leather, petroleum, sugar, coal and timber—are introduced through Barcelona. The export trade is chiefly with the Peninsula, France, Italy, Algeria and with Cuba and Porto Rico. Most of the agricultural products are sent to the Peninsula; wine, figs, marble, almonds, lemons and rice to Europe and Africa.

Administration.—The administration of the Balearic Islands differs in no respect from that of the other Spanish provinces on the mainland. There are five judicial districts (partidos judiciales), named after their chief towns—Inca, Iviza, Manacor, Palma and Port Mahon.

History.—Of the origin of the early inhabitants of the Balearic Islands nothing is certainly known, though Greek and Roman writers refer to the Boeotian and Rhodian settlements. There are numerous sepulchral and other monuments, which are generally believed to be of prehistoric origin. According to general tradition the natives, from whatever quarter derived, were a strange and savage people till they received some tincture of civilization from the Carthaginians, who early took possession of the islands and built themselves cities on their coasts. Of these cities, Port Mahon, the most important, still retains the name which is derived from the family of Mago. About twenty-three years after the destruction of Carthage the Romans accused the islanders of piracy, and sent against them Q. Caecilius Metellus, who soon reduced them to obedience, settled amongst them 3000 Roman and Spanish colonists, founded the cities of Palma and Pollentia (Pollensa), and introduced the cultivation of the olive. Besides valuable contingents of the celebrated Balearic slingers, the Romans derived from their new conquest mules (from Minorca), edible snails, snipe and pitch. Of their occupation numerous traces still exist,—the most remarkable being the aqueduct at Pollenza. In A.D. 423 the islands were seized by the Vandals and in 798 by the Moors. They became a separate Moorish kingdom in 1099, which, becoming extremely oppressive for piracy was the object of a crusade directed against it by Pope Paschal II., in which the Catalan Countess led. This expedition was frustrated at the time, but was resumed by James I. of Aragon, and the Moors were expelled in 1322. During their occupation the island was populous and productive, and an active commerce was carried on with Spain and Africa. King James conferred the sovereignty of the isles on his third son, under whom and his successor they formed an independent kingdom up to 1349, from which time their history merges in that of Spain. In 1521 an insurrection of the peasantry against the nobility, whom they massacred, took place in Majorca, and was not suppressed without much bloodshed. In the War of the Spanish Succession all the islands declared for Charles; the duke of Anjou had no footing anywhere save in the citadel of Mahon. Minorca was reduced by Count Villars in 1707; but it was not till June 1715 that Majorca was subjugated, and meanwhile Port Mahon was captured by the English under General Stanhope in 1708. In 1713 the island was secured to them by the peace of Utrecht; but in 1756 it was invaded by a force of 12,000 French, who, after defeating the British under Admiral Byng, captured Port Mahon. Restored to England in
BALES—BALFOUR, A. J.

1763, the island remained in possession of the British till 1782, when it was retaken by the Spaniards. Again seized by the British in 1788, it was finally ceded to Spain by the peace of Amiens in 1803. While the French invaded Spain in 1808, the Mallorquins did not remain indifferent; the governor, D. Julian Miguel de Vives, announced, amid universal acclamation, his resolution to support Ferdinand VII. At last the Junta would take no active part in the war, retaining the corps of volunteers that was formed in the defence of the island; but finding it quite secure, they transferred a succession of them to the Peninsul to reinforce the allies. Such was the animosity excited against the French when their excesses were known to the Mallorquins, that some of the French prisoners, conducted thither in 1810, had to be transferred with all speed to the island of Cabrera, a transference which was not effected before some of them had been killed.

BIBLIOGRAPHY.—For a general account of the islands, the most valuable books are Die Balearen geschildert in Wort und Bild, by the archduke Ludwig Salvator of Austria (Leipzig, 1839), and Islas Baleares, by C. Vullier (Paris, 1894), the first edition of which has been translated under the title of The Forgotten Isles (London, 1896)—and Islas Baleares, an illustrated volume of 1423 pages, by P. Pifferer, in the series "España" (Barcelona, 1888). An article by P. S. Sand in the Revue des deux mondes (1841) also deserves notice. The following are monographs on special subjects:—The Story of Majorca and Minorca, by Sir C. R. Markham (London, 1864); Illustraciones florales de las Islas Baleares, by B. Cabrera, a meeting in Palermo (1870)—Seventeen primitifs des iles baleares, by E. Cartailhac (Mission scientifique du ministère de l'instruction publique, Toulouse, 1892). The British Foreign Office Reports for the Consular District of Barcelona give some account of the movement of commerce (London, annual). Much of the material available for a scientific history will be found in La Historia general del reino Baleárico, by J. Dametoand V. Mut (Majorca, 1632—1650). For the period of Moorish rule, see Bagaygo historia antigua de las Islas Baleares, by A. Campaner y Eures (Valencia, 1888). See also the elaborate treatise Les Relations de la France avec le royaume de Majorque, by A. Lecoy de la Marche (Paris, 1892).

BALES [BALESIUS], PETER (1547–1610), English calligraphist, one of the inventors of shorthand writing, was born in London in 1547, and is described by Anthony Wood as a "most dexterous person in his profession, to the great wonder of scholars and others." We are also informed that "he spent several years in sciences among Oxonians, particularly, as it seems, in Gloucester Hall; but that study, which he undertook, proved only, at length, an employment of profit." He is mentioned for his skill in micrography in Holinshed's Chronicle of England. "Madame Genus," says Evelyn, "speaking as a miracle of somebody who wrote the Apostles' Creed and the beginning of St. John's Gospel within the compass of a farthing: what would he have said of our famous Peter Bales, who, in the year 1575, wrote the Lord's Prayer, the Creed, Decalogue, with two short prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the queen, to whom he presented it at Hampton Court, all of it written within the circle of a single penny, inclosed in a ring and borders of gold, and covered with a crystal, so accurately wrought as to be very plainly legible; to the great admiration of her majesty, the whole privy council, and several ambassadors then at court?" Bales was likewise very dexterous in imitating handwriting, and between 1575 and 1600 was employed by Secretary Walsingham in certain political manoeuvres. We find him at the head of a school near the Old Bailey, London, in 1595, at which time he published his Writing Schoolmaster, in three Parts. This was included in a work of Broadcloth, which is one of the earliest attempts to construct a system of shorthand. In 1595 he had a great trial of skill with one Daniel Johnson, for a golden pen of £20 value, and won it; and a contemporary author further relates that he had also the arms of calligraphy given him, which are azure, a pen or.

Bales died about the year 1608.

BALEF, MICHAEL WILLIAM (1808–1870), Irish musical composer, was born on the 15th of May 1808, at Dublin. His musical gifts became apparent at an early age. The only instruction he received was from his father, who was a dancing master, and from a musician, C. E. Horn (1786–1840). Between 1814 and 1815 he played the violin for his father's dancing-classes, and at the age of seven composed a polacca. In 1817 he appeared as a violinist in public, and in the same year composed a ballad, first called "Young Fanny," and afterwards, when sung in Paul Pry by Mary Vestris, "The Lovers' Mistake." On the death of his father in 1823 he was engaged in the orchestra of Drury Lane, and being in possession of a small but pleasant baritone voice, he chose the career of an operatic singer. An unsuccessful début was made at Norwich in Der Freischütz. In 1825 he was taken to Rome by Count Mazzara, being introduced to Cherubini on the way. In Italy he wrote his first dramatic work, a ballet, La Pérouse. At the close of 1827 he appeared as Figaro in Rossini's Barbière, at the Italian opera in Paris. Balle soon returned to Italy, where, during the next nine years, he remained, singing at various theatres and composing a number of operas. During this time he married Milde Luisa Roser, a Hungarian singer whom he had met at Bergamo. Féti says that the public indignation roused by an attempt at "improving" Meyerbeer's opera II Crociato by interpolated music of his own composed Balle to throw up his engagement at the theatre La Fenice in Venice. By this time he had produced his first complete opera, Le Contes di se stessi, at Palermo in the first season of 1830–1831; the opera Una Lussuria a Roma was given at Pavia; and Enrico Quarto at Milan, where he had been engaged to sing with Malibran at the Scala. He returned to England in the spring of 1833, and on the 29th of October 1835 his Siege of Rochelle was produced and rapturously received at Drury Lane. Encouraged by his success, he produced The Maid of Artois on the 27th of May 1836—the success of the opera being confirmed by the exquisite singing of Malibran. Balle was a prolific composer, as may be seen from the following imperfect list of his English operas alone:—Siege of Rochelle (1833); The Maid of Artois (1836); Catherine Grey (1837); Joan of Arc (1837); Falstaff (1838); Lablache in title-role; Amelia, or the Love Test (1838); Keolantie (1841); The Bohemian Girl, his best known work (1844); The Daughter of St. Mark (1844); The Enchantress (1845); The Bondman (1846); The Devil's in it (1847); The Maid of Honour (1847); The Sicilian Bride (1852); The Rose of Castile (1857); Santarella (1858); Bianca (1868); The Purlin's Daughter (1861); The Armourer of Nantes (1863); Blanche de Nevers (1863). Balle also wrote several operas for the French, including La Grande Opéra at Paris, and called L'Étoile de Seville was written in 1845 for the Académie Royale. The fact that Balle was an Irishman, who produced operas in English, French and Italian with conspicuous success, is in itself interesting. When we add the record of his operatic impersonations on the stage, the European success of his Bohemian Girl, his picturesque retirement into Hertfordshire in 1864 as a gentleman farmer, and above all the undeniable gift for creating such pure melodies as his songs "When other Hearts" and "I dreamt that I dwelt in marble halls," it is idle to refuse him a prominent place in the history of music. He wrote much that was trivial, but also much that was enduring. He died on the 20th of October 1859, and was buried at Kensal Green. In 1882 a medallion portrait of him was unveiled in Westminster Abbey.

BALFOUR, ARTHUR JAMES (1848–1932). British statesman, eldest son of John Balfour, 10th Lord Balfour of Whittingehame, Haddingtonshire, and Lady Blanche Gascoyne Cecil, a sister of the third marquess of Salisbury, was born on the 25th of July 1848. He was educated at Eton and Trinity College, Cambridge. In 1874 he became M.P. in the Conservative interest for Hertford, and represented that constituency until 1885. In the spring of 1878, Lord Salisbury became foreign minister on the resignation of the fifth Lord Derby, Mr Balfour became his private secretary. In that capacity he accompanied his uncle to the Berlin congress, and gained his first experience of international politics in connection with the settlement of the Russo-Turkish conflict. It was at this time also that he became known in the world of letters, the intellectual subtlety and literary capacity of his Defence of Philosoplic Doubt (1879) suggesting that he might make a reputation as a speculative thinker. Belonging, however, to a
class in which the responsibilities of government are a traditional duty, Mr Balfour divided his time between the political arena and the study. Being released from his duties as private secretary by the sudden death of 1880, he began to take a rather more active part in parliamentary affairs. He was for a time politically associated with Lord Randolph Churchill, Sir Henry Drummond Wolff and Sir John (then Mr) Gorst, the quartette becoming known as the “Fourth Party,” and gaining notoriety by the freedom of the criticisms directed by its leader, Lord Randolph Churchill, against Sir Stafford Northcote, Lord Cross and other prominent members of the “old gang.” In these sallies, however, Mr Balfour had no direct share. He was thought to be merely amusing himself with politics. It was regarded as doubtful whether his health could withstand the severity of English winters, and the delicacy of his physique and the languor of his manner helped to create the impression that, however great his intellectual powers might be, he had neither the bodily strength nor the energy of character requisite for a political career. He was the “odd man” of the Fourth Party, apparently content to fetch and carry for his colleagues, and was believed to have no definite ambitions for his own. His reputation in the management of 1886—1886 was that of a dilettante, who allied himself with the three politicians already named from a feeling of irresponsibility rather than of earnest purpose; he was regarded as one who, on the rare occasions when he spoke, was more desirous to impart an academic quality to his speeches than to make any solid contribution to public questions. The House, indeed, did not take him quite seriously. Members did not suspect the reserve of strength and ability beneath what seemed to them to be the pose of a parliamentary figure; they looked upon him merely as a young member of the governing classes who remained in the House because it was the proper thing for a man of family to do. As a member of the coterie known as the “Souls” he was, so to speak, caviare to the general. Indolence was supposed to be the keynote of his character—a refined indolence, not, however, without cleverness of a somewhat cynical and superior order. That these views were not shared by Lord Salisbury was sufficiently shown by the fact that in his first administration (June 1885—January 1886) he made Mr Balfour president of the Local Government Board, and in forming his second administration (July 1886) secretary for Scotland with a seat in the cabinet. These offices gave few opportunities for distinction, and may be regarded merely as Mr Balfour’s apprenticeship to departmental responsibilities. The accidents of political life suddenly opened out to him a career which made him, next to Lord Salisbury, the most prominent, the most admired and the most attacked Conservative politician of the day. Sir Michael Hicks-Bech, who was chief secretary for Ireland, suffered from an affection of the eyes and found it desirable to resign, and Lord Salisbury appointed his nephew in his stead. The selection took the political world by surprise, and was much criticized. By the Irish Nationalists it was received with contemptuous ridicule, for none suspected Mr Balfour’s immense strength of will, his debasing power, his ability in attack and his still greater capacity as a debater. The controversy on the Crimes Bill and the Irish Land Bill quickly undermined them, and the steady and even remorseless vigour with which the government of Ireland was conducted speedily convinced the House of Commons and the country that Mr Balfour was in his right place as chief secretary. His policy was that of “coercion”—the fearless administration of the Crimes Act, coupled with remedial legislation; and he enforced the one while he proceeded with the other, regardless of the risk of outrage outside the House and of insult within. Mr Balfour’s work in this office covered one of the most turbulent and most exciting periods in modern parliamentary history and Irish administration. With a courage that never faltered he broke down the Plan of Campaign in Ireland, and in parliament he not only withstood the assaults of the Irish Nationalists, but waged successful warfare with the entire Home Rule party. He combined an obstinacy of will with a mastery of facts unsurpassed by any of his predecessors in the secretariat. Events, it is true, were in his favour. The disclosures before the Farran Commission, the O’Shea divorce proceedings, the downfall of Mr Parnell and the disruption of the Irish party, assisted him in his task; but the fact remains that by persistent courage and undeviating thoroughness he reduced crime in Ireland to a vanishing point. His work was also constructive, for he broadened the basis of material prosperity and social progress by creating the Congested Districts Board in 1890. During this period, from 1886—1892, moreover, he developed gifts of oratory which made him one of the most effective of public speakers. Impressive in matter rather than in manner of delivery, and seldom rising to the level of eloquence in the sense in which that quality was understood in a House which had listened to Bright and Gladstone, his speeches were logical and convincing, and their attractive literary form delighted a wider audience than that which listens to the mere politician. In 1888 Mr Balfour served on the Gold and Silver Commission, currency problems from the standpoint of bimetallism being among the more academic subjects which had engaged his attention. On the death of Mr W. H. Smith in 1891 he became first lord of the treasury and leader of the House of Commons, and in that capacity introduced in 1892 a Local Government Bill for Ireland. The Constitution (Ireland) Act was then at an end of its tether, and the project fell through. For the next three years Mr Balfour led the opposition with great skill and address. On the return of the Unionists to power in 1895 he resumed the leadership of the House, but not at first with the success expected of him, his management of the abortive economic proposals of ’96 being even, by his own supporters, to show a disinclination for the continuous drudgery of parliamentary management under modern conditions. But after the opening session matters proceeded more smoothly, and Mr Balfour regained his old position in the estimation of the House and the country. He had the satisfaction of seeing a bill pass for providing Ireland with an improved system of local government, and took an active share in the debates on the various foreign and domestic questions that came before parliament during 1895—1900. His championship of the voluntary schools, his adroit parliamentary handling of the problems opened up by the so-called “crisis in the Church,” caused by the Protestant movement against ritualistic practices, and his pronouncement in favour of a Roman Catholic university for Ireland—for which he outlined a scheme that met with much adverse criticism both from his colleagues and his party,—were the most important aspects of Mr Balfour’s activity during these years. His speeches and work throughout this period took a wider range than before his accession to the leadership of the Commons. During the illness of Lord Salisbury in 1898, and again in Lord Salisbury’s absence abroad, he was in charge of the foreign office, and it fell to his lot to conduct the very critical negotiations with Russia on the question of railways in North China. To his firmness, and at the same time to the conciliatory readiness with which he accepted and elaborated the principles of a modus vivendi, the two powers owed the avoidance of what threatened to be a dangerous quarrel. As a member of the cabinet responsible for the Transvaal and South African affairs in 1895, he supervised the Convention of 1895, and when the war opened so disastrously he was the first to realize the necessity for putting the full military strength of the country into the field. At the general election of 1900 he was returned for East Manchester (which he had represented since 1885) by a majority of 2,453, and continued in office as first lord of the treasury. His leadership of the House of Commons in the first session of the new parliament was marked by considerable firmness in the suppression of obstruction, but there was a slight revival of the criticisms which had been current in 1896. Mr Balfour’s inability to get the maximum amount of work out of the House was largely due to the situation in South Africa, which absorbed the intellectual energies of the House and of the country and impeded the progress of legislation. The principal achievements of the long session of 1902 (which extended to the autumn) were the passing of the Education Act, entirely reorganizing the system of primary education, abolishing the school boards and making the county councils the local authority; new rules of procedure; and the creation...
of the Metropolitan Water Board; and on all these questions, and particularly the two first, Mr Balfour’s powers as a debater were brilliantly exhibited.

On Lord Salisbury’s resignation on the 11th of July 1902, Mr Balfour succeeded him as prime minister, with the cordial approval of all sections of the Unionist party. For the next three and a half years his premiership involves the political history of England, at a particularly interesting period both for foreign and domestic affairs. Within a few weeks Mr Balfour had reconstituted the cabinet. He himself became first lord of the treasury and lord privy seal, with the duke of Devonshire (remaining lord president of the council) as leader of the House of Lords; Lord Lansdowne remained foreign secretary, Mr (afterwards Lord) Ritchie took the place of Sir Michael Hicks-Beach (afterwards Lord St Aldwyn) as chancellor of the exchequer, Mr J. Chamberlain remained colonial secretary, his son Austen being postmaster-general with a seat in the cabinet. Mr G. Wyndham as chief secretary for Ireland was included in the cabinet; Lord Selborne remained at the admiralty, Mr St John Brodrick (afterwards Lord Midleton) war minister, Lord George Hamilton secretary for India, and Mr Akers-Douglas, who had been first commissioner of works, became home secretary; Lord Balfour of Burleigh remained secretary for Scotland, Lord Dudley succeeded Lord Cadogan as lord lieutenant of Ireland, and Lord Longderry became president of the Board of Education (with Sir Wilfrid Anson as parliamentary secretary in the House of Commons). Mr Balfour’s brother Gerald (b. 1853), who had entered public life as his private secretary when at the Local Government Board, and had been chief secretary for Ireland from 1895–1900, retained his position (since 1900) as president of the Board of Trade.

The new prime minister came into power practically at the same moment as the king’s coronation (see Edward VII) and the end of the South African War (see Transvaal). The task of clearing up after the war, both in South Africa and at home, lay before him; but his cordial relations with Mr Chamberlain (q.v.), and the enthusiastic support of a large parliamentary majority, made the prospects fair. For a while no cloud appeared on the horizon: and the Liberal party were still disorganized (see Campbell-Bannerman and Rosebery) over their attitude towards the Boers. Mr Chamberlain went to South Africa in the late autumn, with the hope that his personality would influence the settlement there; and the session of 1903 opened in February with no hint of troubles to come. A difficulty with Venezuela, resulting in British and German warships being sent to the coast of South America, caused an explosion of anti-German feeling in England and some restlessness in the United States, but the government brought the crisis to an end by tactful handling and by an ultimate recourse to arbitration.

The two chief items of the ministerial parliamentary programme were the extension of the new Education Act to London and Mr Wyndham’s Irish Land Purchase Act, by which the British exchequer should advance the capital for enabling the tenants in Ireland to buy out the landlords. Moreover, the budget was certain to show a surplus and taxation could be remitted. As events proved, it was the budget which was to provide a cause of dissension, bringing a new political movement into being, and an issue overriding all the legislative interest of the session. Mr Ritchie’s remission of the shilling import-duty on corn led to Mr Chamberlain’s crusade in favour of tariff reform and colonial preference, and as the session proceeded the rift grew in the Unionist ranks.

In the separate article on Mr Chamberlain the progress of this movement is sufficiently narrated. From this moment it is only necessary here to realize Mr Balfour’s position. He had always admitted the oneness of the English free-trade system, and had supported the desirability of retaliating against unfair competition and “dumping” by foreign countries. But Mr Chamberlain’s new programme for a general tariff, with new taxes on food arranged so as to give a preference to colonial products, involved a radical alteration of the established fiscal system, and such out-and-out Unionist free-traders in the cabinet as Mr Ritchie and Lord George Hamilton, and outside it, like Lord Hugh Cecil and Mr Arthur Elliot (secretary to the treasury), were entirely opposed to this. Mr Balfour was anxious to avoid a rupture, doubtful of the feeling of the country, uncertain of the details by which Mr Chamberlain’s scheme could be worked out. As leader of the party and responsible for the maintenance of so great a political engine, he was anxious not to be precipitate. He was neither for nor against the new movement, and professed to hold “no settled convictions” on the subject. Mr Chamberlain rested his case largely on the alleged diminution in British trade, and the statistics therefore required investigation before the government could adopt any such programme. From the middle of May, when Mr Chamberlain began to press the matter, Mr Balfour had a difficult hand to play, so long as it was uncertain how the party would follow the new lead. The Board of Trade was asked to supply full figures, and while its report was awaited the uncertainty of attitude on the part of the government afforded grateful opportunity for opposition mischief-making, since the Liberal party had now the chance of acting as the conservative champions of orthodox economics. Another opportunity for making political capital was provided by the publication of the report of the royal commission on the Boer War under Lord Elgin’s chairmanship, which horrified the country by its disclosures (August 26th) as to the political and military muddling which had gone on, and the want of any efficient system of organization.

The session ended in August without any definite action on the fiscal question, but in the cabinet the discussions continued. On the 16th of September Mr Balfour published a pamphlet on “Insular Free Trade,” and on the 19th it was announced that Lord George Hamilton and Mr Ritchie had resigned, Lord Balfour of Burleigh and Mr Arthur Elliot following a day or two later. These were the strait free-traders, but at the same time Mr Chamberlain resigned also. The correspondence between Mr Chamberlain and Mr Balfour (September 9th and 16th) was published, and presented the latter in the light of a sympathizer with some form of fiscal union with the colonies, if practicable, and in favour of retaliatory duties, but unable to believe that the country was yet ready to agree to the taxation of food required for a preferential tariff, and therefore unwilling to support that scheme; at the same time he encouraged Mr Chamberlain to test the feeling of the public and to convert them by his missionary efforts outside the government. Mr Chamberlain on his side emphasized his own parliamentary loyalty to Mr Balfour. In the autumn of 1894 Mr Chamberlain reviewed the economic history since Cobden’s time, pointed to the falsification of the promises of the early free-traders, and to the fact that England was still the only free-importing country, and insisted that he was “in harmony with the true spirit of free-trade” when he pleaded for “freedom to negotiate that freedom of exchange may be increased.” This manifesto was at first taken, not only as the platform of the government, but also as that from which its resigning free-trade members had disented; and the country was puzzled by a statement from Lord George Hamilton that Mr Balfour had circulated among his colleagues a second and different document, in fuller agreement with Mr Chamberlain. The situation was confused by personal suspicion and distrust as well as by economic difficulties. But the public noted that the duke of Devonshire, whose orthodoxy was considered typical, remained in the cabinet.

The crisis, however, soon developed further, owing to explanations between the free-trade Unionists. On October 1st Mr Balfour spoke at Sheffield, reiterating his views as to free-trade and retaliation, insisting that he intended to lead, and declaring that he was prepared at all events to reverse the traditional fiscal policy by doing away with the axiom that import duties should only be levied for revenue purposes. The speech was enthusiastically received by the National Union of Conservative Associations, who had year by year flirted with protectionist resolutions, and who were known to be predominantly in sympathy with Mr Chamberlain. But the free-traders did not like Mr Balfour’s formula as to reversing the traditional
fiscal policy of import taxes for revenue only. Next day the duke of Devonshire resigned, a step somewhat bitterly resented by Mr Balfour, who clearly thought that his sacrifices in order to conciliate the duke had now been made in vain. During this critical fortnight the duke had apparently acquiesced in Mr Balfour's compromise, and had co-operated in reconstituting the ministry; his nephew and heir had been made financial secretary to the treasury, while Mr Alfred Lyttelton was appointed colonial secretary, Mr Austen Chamberlain chancellor of the exchequer, Mr Brodrick secretary for India, Mr H. O. Arnold-Forster war minister, Lord Stanley postmaster-general and Mr Graham Murray secretary for Scotland. Lord Londonderry now became president of the council, Lord Lansdowne leader of the House of Lords, and Lord Salisbury, son of the late premier, who as Lord Cranborne had for three years been under-secretary for foreign affairs, was included in the cabinet as lord privy seal.

During the remainder of 1903 the struggle within the Unionist party continued. Mr Chamberlain spoke all over the country, advocating a definite scheme for reorganizing the budget, so as to have more taxes on imports, including food, but proposing to adjust the tariff in order to import and export the same classes of commodities to stimulate employment. The free-trade Unionists, with the duke of Devonshire, Lord Goschen, Lord James and Lord Hugh Cecil, as their chief representatives, started a Free Food league in opposition to Mr Chamberlain's Tariff Reform league; and at a great meeting at Queen's Hall, London, on the 24th of November their attitude was made plain. They rejected Mr Chamberlain's food-taxes, disclosed his statistics, and, while admitting the theoretical orthodoxy of retaliation, criticized Mr Balfour's attitude and repudiated his assumption that retaliation would be desirable. Finally in December came the appointment of Mr Chamberlain's Tariff Commission. There was no doubt about the obstinacy and persistency of both sections, and both were fighting, not only to persuade the public, but for the capture of the party and of its prime minister. Both sides were inclined to claim him; neither could do so without qualifications. His dialectical dexterity in evading the necessity of expressing his fiscal opinions further than he had already done became a daily subject for contemptuous criticism in the Liberal press; but no one doubted his intention to remain till the next parliament; and while he declined to go the "whole hog"—as the phrase went—with Mr Chamberlain, he did nothing to discourage Mr Chamberlain's campaign. Whether he would eventually follow in the same direction, or would come back to the straiter free-trade side, continued to be the political conundrum for month after month. Minor changes were made in the ministry in 1903, Mr Brodrick going to the India office and Mr Arnold-Forster becoming minister for war, but Mr Balfour's personal influence remained potent, the government held together, and in 1904 the Licensing Bill was successfully carried. Though a few Unionists transferred their allegiance, notably Mr. Winston Churchill, and by-elections went badly, Mr Balfour still commanded a considerable though a dwindling majority, and the various contrivances of the opposition for combining all free-traders against the government were obstructed by the fact that anything tantamount to a vote of censure would not be supported by the "wobblers" in the ministerial party, while the government could always manage to draft some "safe" amendment acceptable to most of them. This was notably shown in the debate on Mr Black's motion on the 18th of May. On the 3rd of October Mr Balfour spoke at Edinburgh on the fiscal question. The more aggressive protectionists among Mr Chamberlain's supporters had lately become very confident, and Mr Balfour plainly repudiated "protection" in so far as it meant a policy aiming at supporting or creating home industries by raising home prices; but he introduced a new point by declaring that an Imperial Conference would be called to discuss with the colonies the question of preferential tariffs if the Unionist government obtained a majority at the next general election. The Edinburgh speech was again received with conflicting interpretations, and much discussion prevailed as to the conditions of the proposed conference, and as to whether it was or was not an advance, as the Chamberlainites claimed, towards Mr Chamberlain. Meanwhile the party was getting more and more disorganized, and the public were getting tired of the apparent mystification. The opposition used the situation to make capital in the country, and loudly called for a dissolution.

It was plain indeed that the fiscal question itself was ripe for the polls; Board of Trade statistics had been issued in profusion, and the whole case was before the country. But, though Mr Chamberlain declared his desire for an early appeal to the electors, he maintained his parliamentary loyalty to Mr Balfour. There were, moreover, public reasons why a change of government was undesirable. From 1903 onwards the question of army reform had been under discussion, and the government was anxious to get this settled, though in fact Mr Brodrick's and Mr Arnold-Forster's schemes for reorganization failed to obtain any general support. And while foreign affairs were being admirably conducted by Lord Lansdowne, they were critical enough to make it dangerous to contemplate a "swopping of horses." The Russo-Japanese War might at any moment lead to complications. The exercise by Russian warships of the right of "showing flag" in Chinese waters was causing great irritation in English commercial circles during 1904; a war had occurred, the stopping of the P. & O. steamer "Malacca" on July 13th in the Red Sea by the Russian volunteer cruiser "Peterburg" led to a storm of indignation, and the sinking of the "Knight Commander" (July 24th) by the Vladivostok squadron intensified the feeling. On the 23rd of October the outrageous firing by the Russian Baltic fleet on the English fishing-fleet off the Dogger Bank in the North Sea was within an ace of causing war. It was not till the 28th that Mr Balfour, speaking at Southampton, was able to announce that the Russian government had expressed regret, and that an international commission would inquire into the facts with a view to the responsible persons being punished. Apart from the importance of seeing the Russo-Japanese War through, there were important negotiations on foot for a renewal or revision of the treaty with Japan; and it was felt that on these grounds it would be a mistake for the government to allow itself to be driven into a premature dissolution, unless it found itself unable to maintain a majority in parliament. At the same time the government's chief problem, in the event of its defeat, was obviously the usual interpretation of the Septennial Act involved a dissolution either in 1905 or 1906, and the government whips found increased difficulty in keeping a majority at Westminster, since neither the pronounced Chamberlainites nor the convinced free-trade Unionists showed any zeal, and a large number of the uncertain Unionists did not intend to stand again for parliament.

The events of the session of 1905 soon foreshadowed the end. The opposition were determined to raise debates in the House of Commons on the fiscal question, and Mr Balfour was no less determined not to be caught in their trap. These tactics of avoidance reached their culminating point when on one occasion Mr Balfour and his supporters left the House and allowed a motion hostile to tariff reform to be passed nem. con. Though the Scottish Churches Bill, the Unemployed Bill and the Aliens Bill were passed, a complete fiasco occurred over the redistribution proposals, which pleased nobody and had to be withdrawn owing to a blunder as to procedure; and though on the 17th of July a meeting of the party at the foreign office resulted in a complete defeat of its resolution, the government was caught in a minority of four on the estimates for the Irish Land Commission. For a few days it was uncertain whether they would resign or dissolve, but it was decided to hold on.

The real causes, however, which kept the government in office, were gradually losing their validity. The Russo-Japanese War came to an end; the new offensive and defensive alliance with Japan was signed on the 12th of August; the successful Anglo-French agreement, concluded in April 1904, had brought out a vigorous expression of cordiality between England and France, shown in an enthusiastic exchange of naval visits; and the danger, which threatened in the early summer, of complications...
with France and Germany over Morocco, was in a fair way of being dispelled by the support given to France by Great Britain. The Liberal leaders had given public pledges of their adhesion to Lord Lansdowne’s foreign policy, and the fear of their being unable to carry it on was no longer a factor in the public mind. The end came in November 1905, precipitated by a speech made by Mr Balfour at Newcastle on the 14th, appealing for unity in the party and the sinking of differences, an appeal plainly addressed to Mr Chamberlain, whose supporters—the vast majority of the Unionists—were clamouring for a fighting policy. But Mr Chamberlain was no longer prepared to wait. On the 21st of November at Bristol he insisted on his programme being adopted, and Mr Balfour was compelled to abandon the position he had held with so much tactical dexterity for two years past. Amid Liberal protests in favour of immediate dissolution, he resigned on the 4th of December; and Sir Henry Campbell-Bannerman, being entrusted by the king with the formation of a government, filled his cabinet with a view to a general election in January. The Unionists went to the polls with divided counsels, and sustained a crushing defeat, remarkable, nevertheless, for the comparative success of the tariff reformers. While Mr Chamberlain had a signal personal triumph in all the divisions of Birmingham, Mr Balfour himself was defeated by a large majority in Manchester.

Being in a miserable minority in parliament (157 Unionists against 379 Liberals, 51 Labour members, and 83 Nationalists), some form of consolidation among the Unionists was immediately necessary, and negotiations took place between Mr Balfour and Mr Chamberlain which resulted in the patching up of an agreement (expressed in a correspondence dated February 14th), and its confirmation at a meeting of the party at Lansdowne House a few days later. The new compact was indicated in Mr Balfour’s letter, in which he declared that “fiscal reform is, and must remain, the first constructive work of the Unionist party; its objects are to secure more equal terms of competition for British trade and closer commercial union with the colonies; and while it is at present unnecessary to prescribe the exact methods by which these objects are to be attained, and inexpedient to permit differences of opinion as to these methods to divide the party, though other means are possible, the establishment of a moderate general tariff on manufactured goods, not imposed for the purpose of raising prices, or giving artificial protection against legitimate competition, and the imposition of a small duty on foreign corn, are not in principle objectionable, and should be adopted if shown to be necessary for the attainment of the ends in view or for purposes of revenue.” Mr Balfour’s leadership of the whole party was now confirmed; and a seat was found for him in the City of London by the retirement of Mr Gibbs.

The downfall of Mr Balfour’s administration, and the necessity of reorganizing the Unionist forces on the basis of the common platform now adopted, naturally represented a fresh departure under his leadership, the conditions of which to some extent depended on the opportunities given to the new opposition by the proceedings of the Radical government (see Campbell-Bannerman, H. and Asquith, H. H.). His own administration had been wrecked, through no initiative of his, by the dissensions over the fiscal question. But his wide range of knowledge and interests, his intellectual finesses, his personal hold over his supporters, his statesmanlike grasp upon imperial problems and his oratorical ability, had been proved to a remarkable degree; and in foreign affairs his tenure of power had been conspicuously successful. He left his country indeed in a position of strength abroad, which it had not held since the Crimean War. His institution of the permanent Committee of Imperial Defence, and of the new Army Council (1904), were reforms of the highest importance, resulting from the report of a “triumvirate” consisting of Lord Esher, Sir John Fisher and Sir George Clarke, appointed in November 1903. The Unionist régime as a whole, however, had collapsed. Its ministries had become “stale.” The heavy taxation of the war years was still retained, to the disgust especially of the income-tax payers; and new issues arose over the Education Act, labour questions, and the introduction of Chinese labour into South Africa (in 1904), which were successfully used against the government in the constituencies. The result was an electoral defeat which indicated, no doubt, a pronounced weakening of Mr Balfour’s position in public confidence. This verdict, however, was one based mainly on temporary reasons, which were soon to be overshadowed by the new issues involved in the change of ministry. As a matter of fact, a year of opposition had not passed before his power in the House of Commons, even with so small a party behind him, was once more realized. The immense Radical majority started with a feeling of contempt for the leader who had been rejected at Manchester, but by 1907 he had completely reasserted his individual pre-eminence among parliamentarians. Mr Balfour had never spoken more brilliantly, nor shone more as a debater, than in these years when he had to confront a House of Commons three-fourths of which was hostile. His speech at Birmingham (November 14, 1907), fully accepting the principles of Mr Chamberlain’s fiscal policy, proved epoch-making in consolidating the Unionist party—except for a small number of free-traders, like Lord Robert Cecil, who continued to hold out— in favour of a general tariff rate; and during 1908 the process of recuperation went on, the by-elections showing to a marked degree the increased popular support given to the Unionist candidates. This recovery was due also to the forcible-feebler character of the Radical campaign against the House of Lords, the unpopularity of the Licensing Bill, the failure of the government to arrive at an education settlement, the incapacity of its Irish administration, its apparent domination by the “little navy” section, and its dallying with Socialism in the budget of 1909.

The rejection of this budget in December by the House of Lords led to a desperate struggle at the polls in January 1910, but the confident hopes of the Unionists were doomed to disappointment. They won back over a hundred seats, returning 273 strong, but were still in a minority, the Liberals numbering 275, Labour members 40, and Irish Nationalists 82. Mr Balfour himself was elected for the City of London by an enormous majority.

Mr Balfour’s other publications, not yet mentioned, include Essays and Addresses (1893) and The Foundations of Belief, being Notes introductory to the Study of Theology (1895). He was made LL.D. of Edinburgh University in 1881; of St Andrews University in 1885; of Cambridge University in 1888; of Dublin and Glasgow Universities in 1891; lord rector of St Andrews University in 1886; of Glasgow University in 1890; chancellor of Edinburgh University in 1891; member of the senate London University in 1888; and D.C.L. of Oxford University in 1891. He was president of the British Association in 1904, and became a fellow of the Royal Society in 1888. He was known from early life as a cultured musician, and became an enthusiastic golf player, having been captain of the Royal and Antient Golf Club of St Andrews in 1894-1895. (H. Ch.)

Balfour, Francis Maitland (1822-1882), British biologist, younger brother of Arthur James Balfour, was born at Edinburgh on the 10th of November 1851. At Harrow school he was an apt scholar but little interested in school routine, but in one of the masters, Mr George Griffith, he found a friend who encouraged and aided him in the pursuit of natural science, a taste for which, and especially for geology, had been cultivated in him by his mother from an early age. Going into residence at Trinity College, Cambridge, in 1876, he was elected a natural science scholar of his college in the following year, and although his reading was not ordered on the lines usual for the Schools, he obtained the second place in the Natural Science Tripos of December 1873. A course of lectures on embryology, delivered by Sir Michael Foster in 1871, definitely turned his attention to animal morphology, and, after his tripos, he was selected to occupy one of the two seats allocated to the university of Cambridge at the Naples zoological station. The research work which he began there contributed in an important degree to his election as a fellow of Trinity in 1874, and also afforded him material for a series of papers (published as a monograph in 1878) on the Elasmobranch fishes, which threw new light on
the development of several organs in the Vertebrates, in particular of the uro-genital and nervous systems. His next work was to complete his great treatise, *Comparative Embryology*, in two volumes; the first, published in 1880, dealing with the Invertebrates, and the second (1881) with the Vertebrates. This book displayed a vigorous scientific imagination, always controlled by a logical sense that rigidly distinguished between proved fact and mere hypothesis, and it at once won wide recognition, not only as an admirable digest of the numberless observations made with regard to the development of animals during the quarter of a century preceding its publication, but also on account of the large amount of original research incorporated in its pages. Balfour's reputation was now such that other universities became anxious to secure his services, and he was invited to succeed Professor George Rolleston at Oxford and Sir Wyville Thomson at Edinburgh. But although he was only a college lecturer, holding no official post in his university, he declined to leave Cambridge, and in the spring of 1882 the university recognized his merits by instituting a special professorship of animal morphology for his benefit. Unhappily he did not deliver a single professorial lecture. During the first term after his appointment he was incapacitated from work by the attack of typhoid fever. Gone too, the powers to recall his health, he perished, probably on the 19th of July 1882, in attempting the ascent of the Aiguille Blanche, Mont Blanc, at that time unscathed.

Besides being a brilliant morphologist, Balfour was an accomplished naturalist, and had he lived would probably have taken a high place among British taxonomists.

**Balfour, Sir James, Bart. (of Dennyine and Kinnaid)** (c. 1600–1657), Scottish annalist and antiquary. He was well acquainted with Sir William Segar and with Dugdale, to whose *Monasticon* he contributed. He was knighted by Charles I. in 1630, was made Lyon king-at-arms in the same year, and in 1633 baronet of Kinnaid. He was removed from his office of king-at-arms by Cromwell and died in 1657. Some of his numerous works are preserved in the Advocates' library at Edinburgh, together with his correspondence—from which rich collection Haig published *Balfour's Annals of Scotland* in 4 vols. 8vo (1824–1825).

**Balfour, Sir James (of Pittendreich)** (d. 1583 or 1584), Scottish judge and politician, son of Sir Michael Balfour of Montquhaney, was educated for the legal branch of the church of Scotland. In June 1547, together with Knox and others taken at St Andrews, he was condemned to the French galleys, but was released in 1549, abjured the reformers, entered the service of Mary of Guise, and was rewarded with some considerable legal appointments. Subsequently he went over to the lords of the congregation and then betrayed their plans. After Mary's arrival in Scotland he became one of her secretaries, in 1565 being reported as her greatest favourite after Rizzio. 1 He obtained the patronage of Fisk in Fife in 1561, was nominated a lord of session, and in 1563 one of the commissioners of the court which now took the place of the former ecclesiastical tribunals. In 1565 he was made a privy councillor, elected lord- clerk-registrar, and was knighted. According to Mary his murder was intended together with Rizzio's in 1566. An adherent of Bothwell, he was deeply implicated in Darnley's murder, though not present at the commission of the crime. By his means Darnley was lodged at Kirk o' Field, his brother's house. He was supposed to have drawn up the bond at Craigmiller for the murder; he signed it, was made under Bothwell's deputy-governor of Edinburgh Castle, and is said to have drawn up the marriage-contract between Bothwell and Mary. When, however, the fall of Bothwell was seen to be impending he rapidly changed sides and surrendered the castle to Murray, stipulating for his pardon for Darnley's murder, the retention of the priory of Pitenweem, and pecuniary rewards. He was appointed president of the court of session on resigning the office of lord-clerk-register. He was present at the battle of Langside with the regent in 1568, and was accused of having advised Mary to leave Dunbar to her ruin, and of having betrayed to her enemies the casket letters. The same year, however, in connection with another rumour of Mary's faction, he was dismissed, and next year was imprisoned on the charge of complicity in Darnley's murder. He succeeded in effecting his escape by means of bribery, the expenses of which he is said to have paid by intercepting the money sent from France to Mary's aid. In August 1571, during the regency of Lennox, an act of forfeiture was passed against him, but next year he was again playing traitor and discovering the secrets of his party to Morton, and he obtained a pardon from the latter in 1573 and negotiated the pacification of Perth the same year. Distressed by all parties, he fled to France, where he seems to have remained till 1580. In 1579 his forfeiture was renewed by act of parliament. In January 1580 he wrote to Mary offering her his services, and in June protested his desire to be useful to Elizabeth, lamented the influence of the Jesuits, and intended a journey to Dieppe to hear some good Protestant preaching, 2 On the 27th of December of the same year he returned to Scotland and effected the downfall and execution of Morton by producing a bond, probably that in defence of Bothwell and to promote his marriage with Mary, and later, perhaps, under the influence of the Duke of Bothwell's intention to murder Darnley. In July 1581 his bond was acquittted of murder by assize, and shortly afterwards in 1582 he was restored to his estates and received at court. His career, one of the blackest in the annals of political perfidy and crime, closed shortly before the 24th of January 1584. He was the greatest lawyer of his day, and part-author of at least of Balfour's *Practicks*, the earliest text-book of Scottish law, not published, however, till 1714. He married Margaret, daughter and heir of Michael Balfour of Burleigh, by whom, besides three daughters, he had six sons, the eldest of whom was created Baron Balfour of Burleigh in 1607. 3

**BIBLIOGRAPHY.**—See article in the *Dict. of Nat. Biog.* and authori- ties cited; the *Commentarii in Organum Logicum Aristotelis* (Bordeaux, 1618); the copy in the British Museum contains a number of highly-elogi-astic poems in honour of Balfour, who is described as *Gratus aemulus acer*. Balfour was one of the scholars who contributed to spread over Europe the fame of the *praefatio ingenuum Scotorum*. His contemporary, Dempster, called him the "phoenix of his age, a philosopher profoundly skilled in the Greek and Latin languages, and a mathematician worthy of being compared with the ancients." His *Clavis medicae*, with notes and Latin translation, was reprinted at Leiden as late as 1820.

**Balguy, John** (1686–1748), English divine and philosopher, was born at Sheffield on the 12th of August 1686. He was educated at the Sheffield grammar school and at St John's College, Cambridge, graduated B.A. in 1706, was ordained in 1710, and in 1711 obtained the small living of Lamesley and mansefield in Durham. He married in 1715. It was the year in which Bishop Hoadly published his *History of the Kingdom of Christ*, which gave rise to the "Bangorian controversy"; and Balguy, under the nom de plume of Silvius, began his career of authorship by taking the side of Hoadly in this controversy against some of his High Church opponents.

1 *Cal. of State Pap. (Scottish)*, ii. 218, 250.

2 *Cal. of State Pap. (Foreign)*, 1579–1580, p. 294.

3 The title was attained in 1716, through the 5th baron's com- plicity in the Jacobite rising of 1715. In 1869 it was restored to Alexander Hugh Bruce (b. 1849), 6th baron; he became one of the most influential of contemporary Scottish noblemen, on the Conservative side in politics, and was secretary for Scotland from 1893 to 1903.
In 1726 he published *A letter to a Deist concerning the Beauty and Excellency of Moral Virtue, and the Support and Improvement which it receives from the Christian Religion*, chiefly designed to show that, while a love of virtue for its own sake is the highest principle of morality, religious rewards and punishments are most valuable, and in some cases absolutely indispensable, as sanctions of conduct. In 1727 he was made a prebendary of Salisbury by his friend Hoadley. He published in the same year the first part of a tractate entitled *The Foundation of Moral Goodness*, and in the following year a second part, *Illustrating and enforcing the Principles contained in the former*. The aim of the work is two-fold—to refute the theory of Hutcheson regarding the basis of rectitude, and to establish the theory of Cadworfth and Clarke, that virtue is conformity to reason—the acting according to fitness which arise out of the eternal and immutable relations of agents to objects. In 1726 he became vicar of Northallerton, in the county of York. His next work was an essay on *Divine Rectitude: or, a Brief Inquiry concerning the Moral Perfections of the Deity, particularly in respect of Creation and Providence*. It is an attempt to show that the same moral principle which ought to direct human life may be perceived to underlie the works and ways of God: goodness in the Deity not being a mere disposition but existing in all the powers and performances which are not merely relative to our faculties and capacities, but real and absolute; claiming for their own sake the reverence of all intelligent beings, and alone answering to the perfection of the divine ideas. Balguy wrote several other terse and readable tracts of the same nature, which he collected and published in a single volume in 1734. In 1741 he published an *Essay on Redemption*, containing somewhat advanced views. Redemption as taught in Scripture means, according to him, "the deliverance or release of mankind from the power and punishment of sin, by the meritorious sufferings of Jesus Christ," but involves no translation of guilt, substitution of persons or vicarious punishment. Freed from these ideas, which have arisen from interpreting literally expressions which are properly figurative, he argues, satisfies deep and urgent human wants, and is in perfect consistency and agreement with reason and rectitude. His last publication was a volume of sermons, pervaded by good sense and good feeling, and clear, natural and direct in style. He died at Harrogate on the 21st of September 1748. A second volume of sermons appeared in 1750 (3rd ed., 2 vols., 1760).

**BALIKISRI** (Balukiser) is the capital of the Balinese sultanate, which is separated by Bali Strait, which is shallow, and scarcely over a mile in width at its narrowest point. Bali is 93 m. in length, and its greatest breadth is 50 m. The area is 2095 sq. m. In 1882, for administrative purposes, Bali was separated from Java and combined with the island of Lombok to form the Dutch residency of Lombok and Bali. Politically its divisions are two: (1) the two districts, Buleung and Jembrana, on Dutch territory; and (2) the autonomous states of Klung Lung, Bangli, Mengwi, Badung and Tabanan. Bulelung, on the north-west, is the chief town. The population on Dutch territory in the whole residency in the year 1905 was 523,535. Bali belongs physically to Java; the climate and soil are the same and it has mountains of proportionate height. There are several lakes of great depth and streams well fitted for the purposes of irrigation, of which full advantage is taken by the natives. The geological formation includes (like that of Java) three regions—the central volcanic, the southern peninsula of Tertiary limestone, and alluvial plains between the older formations. The highest volcanoes, Tabanan, Batukaru and Gunung Agung (Bali Beak), have respectively heights of 2,543 ft., 9,457 ft., and 10,497 ft.; the central coast lies at an average altitude of 3282 ft. As regards flora and fauna Bali is associated with Java. The deep strait which separates it on the east from Lombok was taken by A. R. Wallace (q.v.) as representing the so-called Wallace's Line, whereby he demarcated the Asiatic from the Australian fauna.

They are skilful agriculturists and artisans, especially in textile fabrics and the manufacture of arms. Though native rule is tyrannical and arbitrary, especially in the principalities of Badung and Tabana, trade and industry could not flourish if insecurity of persons and property existed to any great extent. The natives have also a remedy against the aggression of their rulers in their own hands; it is called *Métolas*, consists in a general rising and renunciation of allegiance, and proves mostly successful. Justice is administered from a written civil and criminal code. Slavery is abolished. Hinduism, which was once the religion of Java, but has been extinct there for four centuries, is still in vogue in the islands of Bali and Lombok, where the cruel custom of widow-burning (suttee) is still practised, and the Hindu system of the four castes, with a fifth or Pariah caste (called *Chandala*), adhered to. It appears partly blended with Buddhism, partly overgrown with a belief in *Kalas*, or evil spirits. To appease these, offerings are made to them either direct or through the mediation of the *Dewas* (domestic or agrarian deities); and if these avail not, the *Menyépé* or Great Sacrifice is resorted to. In the course of this ceremony, after the sacrifice, men rush in all directions carrying torches; the women also carry fire-brands, or knock on the houses with rice-crushers and other heavy implements, and thus the evil spirits are considered to be driven away. The *Métolas* religion occurs among the coastal population. The Balinese language belongs to the same group of the Malayan class as the Javanese, Sundanese, Madurese, etc., but is as distinct from each of these as French is from Italian. It is most nearly akin to the Sasak language spoken in Lombok and on the east coast of Bali. The literary language has embodied many of its ingredients from the Old Javanese, as spoken in Java at the time of the fall of Majapahit (15th century), while the vulgar dialect has kept free from such admixture. Javanese influence is also traceable in the use of three varieties of speech, as in the Javanese language, according to the rank of the people addressed. The alphabet is with some modifications the same as the Javanese, but more complicated. The material universally used for writing on is the prepared leaf of the lontar palm. The sacred literature of the Balinese is written in the ancient Javanese or *Kawi* language, which appears to be better understood here than it is in Java. A general decline in culture is manifest in the Balinese. Of the early history of the island and the Balinese, nothing is known. The oldest tradition they possess is that the island was at one time part of the Majapahit dynasty in Java, about the middle of the 13th century, but it has been supposed that there must have been Indian settlers here before the middle of the 1st century, by whom the present name, probably cognate with the Sanskrit *bali*, strong, was in all likelihood imposed. It was not till 1633 that the Dutch attempted to enter into alliance with the native princes, and their earliest permanent settlement at Port Badung only dates from 1845. Their influence was extended by the results of the war which they waged with the natives about 1847—49.

The only roadstead safe all the year round is Temukus on the north coast. The rivers are not navigable. Agriculture is the chief means of subsistence; rice being a crop of particular importance. Other crops grown for export are coffee, tobacco, cocoa and indigo. Gold-working, the making of arms and musical instruments, wood-carving, cotton, silk and gold thread weaving are of importance. There are numerous Arab and Chinese traders. See R. van Eck, *Scheuten van het eiland Bali*, Tijdhsch. van Nederl. Ind. (1878—1879); J. Jacobs, *Een geen tijd onder de Baliers* (Batavia, 1883); H. Tonkes, *Volksleven von Bali* (Halle, 1888); Liefhink, *De rijst cultuur op Bali*, Indische Gids. (1886).

**BALIKISRI** (Balukiser), a town of Asäl Minor, capital of the Karas sanjak in the vilayet of Brusa, altitude 575 ft., situated on the river flowing ground above a fertile plain which drains to the Sea of Marmora. Pop. 20,000. It is an industrial centre of trade in opium, silk and cereals, communicating by carriage roads with Panderm. The sanjak is rich in mineral wealth; silver mines are worked at Bali and boracite mines at Susuru. At or near Balikisi was the Roman town of Hedrianautha, founded, as its name commemorates, by the emperor Hadrian.
BALIOL, the name of a family which played an important part in the history of Scotland. The founder of the family in England was a Norman baron, Guy or Guido de Baliol, who held the fiefs of Bailleul, Dampierre, Harcourt and Vinoy in Normandy. Coming to England with William the Conqueror, he received lands in the north of England from William II., and his son, or grandson, Bernard or Barnard de Baliol, built a fortress in Durham called Castle Barnard, around which the town of Barnard Castle grew. The first baronesses probably obtained their privileges from him. Bernard fought for King Stephen during the civil war, was present at the battle of the Standard in August 1138, and was taken prisoner at the battle of Lincoln in February 1141. The date of his death is uncertain. Dugdale only believes in the existence of one Bernard de Baliol, but it seems more probable that the Bernard de Baliol referred to in 1138 was the elder Bernard, and not the same individual. If so the younger Bernard was one of the northern barons who raised the siege of Alnwick, and took William the Lion, king of Scotland, prisoner in July 1174. He also confirmed the privileges granted by his father to the baronesses of Barnard Castle, and was succeeded by his son Eustace. Practically nothing is known of Eustace, or of his son Hugh who succeeded about 1215. Hugh's son and successor, John de Baliol, who increased his wealth and position by a marriage with Dervorguilla (d. 1260), daughter of Alan, earl of Galloway, is said to have possessed thirty knights' fees in England and one half of the lands in Galloway. He was one of the regents of Scotland during the minority of Alexander III., but in 1255 was deprived of this office and his lands forfeited for treason. He then appeared in England fighting for Henry III. against Simon de Montfort, and was taken prisoner at the battle of Lewes in 1264. About 1265 he established several scholarships at Oxford, and after his death in 1269 his widow founded the college which bears the name of the family. He left four sons, three of whom died without issue, and in 1278 his lands came to his son, John de Baliol (q.v.), who was king of Scotland from 1292 to 1296, and who died in Normandy in 1315. John's eldest son by his marriage with Isabel, daughter of John de Warrenne, earl of Surrey, was Edward de Baliol who shared his father's captivity in England in 1296. Subsequently crossing over to France, he appears to have lived mainly on his lands in Normandy until 1324, when he was invited to England by King Edward II., who hoped to bring him forward as a candidate for the Scottish crown. A favourable opportunity, however, did not arise until after the death of King Robert the Bruce in 1306, when Edward III. had succeeded to his father on the English throne. Although Edward did not give Baliol any active assistance, the claimant placed himself at the head of some dispossessed Scottish nobles, raised a small army and sailed from Ravenspur. Landing at Kinghorn in Fife Sheriff in August 1332, he gained a complete victory over the Scots under Donald, earl of Mar, at Dupplin Moor, took Perth, and on the 24th of September was crowned king of Scotland at Scone. He then acknowledged Edward III. as his superior, but soon afterwards was defeated at Annan (where his brother, Henry de Baliol, was slain) and compelled to fly to England. Regaining his kingdom after the defeat of the Scots at Halidon Hill in July 1333, Baliol surrendered the whole of the district formerly known as Lothian to Edward, and did homage for Scotland to the English king. His party, however, was weakened by disunion, and he won no serious support in Scotland. Entirely dependent on Edward, he again sought refuge in England, and took a very slight part in the war waged on his behalf. He returned to Scotland after the defeat of King David II. at Neville's Cross in 1346. After making an absolute surrender of Scotland to Edward III. in 1356 at Roxburgh in return for a pension, Edward de Baliol died at Wheatley near Doncaster in 1357.

A cadet branch of the Baliol family was descended from Ingelram, or Engleram, a son of the younger Bernard de Baliol. Ingelram's wife was the daughter and heiress of William de Berkeley, lord of Reidcastle in Forfarshire, and chamberlain of Scotland, and by her he had a son Henry, who became chamberlain about 1223. Henry married Lora or Lauretta, a daughter of Philip de Valoines (Valsques), lord of Panmure, and in 1234 inherited part of the rich English fiefs of the Valoines family. He sided with the English barons against John in 1215, and accompanied Henry III. to France in 1242. He died in 1246. It is probable but not certain that Henry's son was Alexander de Baliol, lord of Cavers in Teviotdale, and chamberlain of Scotland. Alexander took a leading part in Scottish affairs during the latter part of the 13th century, and is first mentioned as chamberlain in 1287. He shared in the negotiations between the Scottish nobles and Edward I. of England which culminated in the treaty of Salisbury in 1289, and the treaty of Brigham in 1290. Probably deprived of his office as chamberlain in about 1296 he may have shared the imprisonment of his kinsman, John de Baliol the king. He then fought in Scotland for Edward, and was summoned to several English parliaments. His wife was Isabella de Chilham, through whom he obtained lands in Kent. He died about 1306, leaving a son, Alexander, whose son, Thomas, sold the estate of Cavers to William, earl of Douglas, in 1368. Thomas is the last of the Baliols mentioned in the Scottish records.

A late and dubious tradition asserts that the family name became so discredited owing to the pusillanimous conduct of John and Edward Baliol that it was abandoned by its owners in favour of the form Baillie.

BALIOL, JOHN DE (1249-1313), king of Scotland, was a son of John de Baliol (d. 1260) of Barnard Castle, Durham, by his wife Dervorguilla, daughter of Alan, earl of Galloway, and became head of the Baliol family (see above) and lord of extensive lands in England, France and Scotland on his elder brother's death in 1278. Little else, however, is known of his early life. He came into prominence when the Scottish throne became vacant in 1290 owing to the death of Margaret, the "maid of Norway," a granddaughter of King Alexander III., and was one of the three candidates for the crown whose pretensions were seriously considered. Claiming through his maternal grandmother, Margaret, the eldest daughter of David, earl of Huntingdon, Baliol had a strong claim to the English throne, and his principal rival was Robert Bruce, earl of Annandale, and the dispute was the somewhat familiar one of the eldest by descent against the nearest of kin. Meanwhile the English king, Edward I., was closely watching the trend of affairs in Scotland and was invited to settle this dispute. It is doubtful what rights, if any, the English kings had over Scotland, but when Edward met the Scottish nobles at Norham in May 1291, he demanded a formal recognition of his position as overlord of Scotland. After some delay this was tacitly admitted by the nobles, and acknowledged by Baliol and the other competitors, who all agreed to abide by his decision. A court of eighty Scotsmen and twenty-four Englishmen was then appointed to try the question. Traversing the statements made in favour of James, Baliol claimed by the principles of feudal law for an indivisible inheritance, and on the advice of the court Edward decided in his favour. Having sworn fealty to the English king, Baliol was crowned king of Scotland at Scone on the 30th of November 1292; in his new capacity he came to Edward at Newcastle, and in January 1293 released the English king from all promises and obligations made while the kingdom of Scotland was in his hands. These amicable relations were soon disturbed. A Scottish vassal carried his case to Edward as Baliol's overlord, and Baliol himself was soon summoned to the English court to answer a suit brought against him. After a short struggle he admitted Edward's right, and in May 1294 attended a parliament in London. He soon quarrelled with his overlord, the exact point at issue being doubtful, and returned...
to Scotland. Consequent on the dispute which had broken out between England and France, a council of twelve was appointed to assist him, and it was decided to defy Edward. Englishmen were dismissed from the Scottish court, their fees were con
fiscated, and an alliance was concluded with Philip IV., king of France. War broke out, but Baliol did not take the field in person. Invading Scotland, Edward met with a feeble resistance, and at Brechin in July 1296 Baliol surrendered his kingdom to Antony Bek, bishop of Durham, as the representative of the English king. About the same time he appeared before Edward at Montrose, and delivered to him a white rod, the feudal token of resignation. With his son, Edward, he was taken a prisoner to England, remaining in captivity until July 1320, when he was released at the request of Pope Boniface VIII. He lived for some time under the pope's supervision, and seems to have passed his remaining days quietly on his French estates. He died in Normandy early in 1315, leaving several children by his wife, Isabel, a daughter of John de Warenne, earl of Surrey (d. 1304).

BALIUAG, a town of the province of Bulacan, Luzon, Philippine Islands, on the Quingua river, 29 m. (by rail) N.N.W. of Manila. Pop. (1905) 21,008, including the population (7072) of Bustos, which was annexed to Baliuag in that year after the census was taken. Baliuag is served by an extension of the railway between Manila and Dagupan. It is the trade centre of a fertile agricultural district, and manufactures bamboo hats, silk and native fibre goods.

BALKAN PENINSULA, the most easterly of the three large peninsulas which form the southern extremities of the European continent. Its area, 184,779 sq. m., is about 35,000 sq. m. less than that of the Iberian Peninsula, but more than twice that of the Italian. Its northern boundary stretches from the Kilia mouth of the Danube to the Adriatic Sea near Fiume, and is generally regarded as marked by the courses of the rivers Danube, Save and Kupa. On the E. it is bounded by the Black Sea, the Sea of Marmora, and the Aegean; on the S. by the Mediterranean; on the W. by the Ionian Sea and the Adriatic. With the exception of the Black Sea coast and the Albanian littoral, its shores are considerably intersected by groups of islands. Half the Peninsula in its general contour resembles an inverted cone, pyramid or triangle, terminating at its apex in a subsidiary peninsula, the Peloponnesus or Morea. Its surface is almost entirely mountainous, the only extensive plains being those formed by the valleys of the Danube and Marita, and the basin of Thessaly drained by the Salambria (ancient Penes). The Danubian plain, lying, for the most part, outside the Peninsula, is enclosed, on the north, by the Carpathians, and on the south by the Balkans, from which the Peninsula derives its name. These ranges form together the great semi-circular mountain-chain, known as the anti-Dacian system, through which the Danube finds a passage at the Iron Gates. The other mountain-systems display great complexity of formation; beginning with the Dinaric Alps and the parallel ranges of Bosnia, they run, as a rule, from north-west to south-east; the great chain of Rhodope traverses the centre of the Peninsula, throwing out spurs towards the Black Sea and the Aegean; farther west are the lofty Shar Dagh and the mountains of Montenegro and Albania, continued by the Pindus range and the heights of Acarnania and Aetolia. The principal summits are Olympus (7974 ft.), overlooking the Gulf of Salonica; Musulá (8712 ft.) and Petovoa Skaphia (8855), both in the Rhodope system; Llibotn in the Shar Dagh (8089); Elin, in the Perin Planina (8794); Belmeken in southern Bulgaria (chain of Dospat, 8562); Smolika in the Pindus range (8445); Dormitor in northern Montenegro (8294); Kaimakchalan in central Macedonia (8255); and Kiona in Aetolia (8235). Owing to the distribution of the mountain-chains, the principal rivers flow in an easterly or south-easterly direction; the Danube falls into the Black Sea; the Maritsa, Mesta, Struma (Strimon), Vardar and Salambind into the Aegean. The only considerable rivers flowing into the Adriatic are the Narenta, Drin and Vissosa. The principal lakes are those of Ochrida, Prespa, Scutari and Iannina. The climate is more severe than that of the sister peninsulas, and the temperature is liable to sudden changes. The winter, though short, is often intensely cold, especially in the Danubian plain and in Thrace, the rigorous climate of which is frequently alluded to by the Latin poets. Bitter north-easterly winds prevail in the spring, and snow is not uncommon even in the low-lying districts of Greece. The autumn weather is generally fine and clear.

Geology.—Broadly speaking, the Balkan Peninsula may be divided into four areas which geologically are distinct. There is a central region, roughly triangular in shape, with its base resting upon the Aegean Sea and its apex in Servia. On two sides this area is bordered by belts of folded beds which form on the west the mountain ranges of the Adriatic and Ionian coasts, and on the north the chain of the Balkans. Finally, beyond the Balkans lies the great Rumanian depression, occupied chiefly by undisturbed Cretaceous and Tertiary strata. The central region, although wedged in between two belts of folding, is not affected by the folds of either, excepting near its margins. It consists largely of crystalline and schistose rocks. The core is formed by the mountain masses of Rhodope, Belasitza, Perin and Rila; and here Palaeozoic and Mesozoic beds are absent, and the earliest sedimentary deposits belong to the Tertiary period and lie flat upon the crystalline rocks. Upon the margins, however, Cretaceous beds are found. The eastern parts of Greece are composed almost entirely of Cretaceous beds, but nevertheless they must be considered to belong to the central area, for the folds which affect them are nearly at right angles to those of the western chains. In general, however, the central area is one of faulting rather than of folding, and the sedimentary beds sometimes lie in troughs formed by faults. Extensive volcanic outbursts occurred in this region during the Tertiary period. In the western folded belt the strike of the fold is in N.W.-S.E., or N.N.W.-S.S.E. There are many local irregularities, but the general direction is maintained as far as the southern extremity of Greece, where the folds show a tendency to curve towards Crete. In the north, Carboniferous beds are present, and the Trias and the Jura take a considerable part in the formation of the chain. The Sarmatian beds are also involved in the folds, indicating that the folding was not completed till Pliocene times. In the south, the older beds disappear and the whole chain is formed chiefly of Cretaceous beds, though Eocene and probably Jurassic rocks are
The Eocene beds are folded, but the marginal Pliocene beds are not, and the final folding seems to have taken place during the Miocene period. (For the Balkans, see BULGARIA.)

**Area and Population.**—The following figures show the area and population of the various political divisions of the Balkan Peninsula in 1909; see also the articles on the separate countries.

For full details as to the physical features, natural products, population, customs, trade, finance, government, religion, education, language, literature, antiquities, history, politics, &c., of the Balkan lands, see ALBANIA, BOSNIA AND HERZEGOVINA, BULGARIA, CROATIA-SLAVONIA, DALMATIA, DOBRUDJA, GREECE, ILLYRIA, MACEDONIA, MONTENEGRO, NOVI-BAZAR, SERVIA AND TURKEY.

**Races.**—The Peninsula is inhabited by a great variety of races, whose ethnological limits are far from corresponding with the existing political boundaries. The Turkish population, descended in part from the Ottoman invaders of the 14th and 15th centuries, appeared in the rest of Greece, almost entirely in Servia; and it continues to decrease in Bulgar, notwithstanding the efforts of the authorities to check emigration. It is nowhere found in compact masses except in north-eastern Bulgaria and the region between Adrianople, the Black Sea and the Sea of Marmora.

Elsewhere it appears in separate villages and isolated districts, or in the larger towns and their immediate neighbourhood. The total Turkish population of the Peninsula scarcely exceeds 1,800,000. The Slavonic population, including the Serbo-Croats and Bulgars, is by far the most numerous; its total aggregate exceeds 10,000,000. The majority of the Serbo-Croats left their homes among the Carpathians and settled in the Balkan Peninsula in the 7th century. The distinction between the Serbs of the more central region and the Croats of the north-west, was first drawn by the early Byzantine chroniclers, and was well established by the 12th century. It does not correspond with any valid linguistic or racial difference; but in the course of time a strong religious influence drew. Along the Croatian and Dalmatian coast, there existed a well-developed civilization, which was sustained by constant intercourse with Italy; and, under its influence, the Serbo-Croatian immigrants were converted to the Roman Catholic Church. In the wild and mountainous interior, however, the Byzantine Church had few or no rivals and the Orthodox creed prevailed. The Orthodox Serbs inhabit the kingdom of Servia, Old Servia (or Novibazar and north-western Macedonia), Montenegro, Herzegovina and parts of Bosnia. The Roman Catholic Croats predominate in Dalmatia, north-western Bosnia and Croatia-Slavonia. Montenegro, like the other mountainous regions, adhered to the Greek Church; it received a number of Orthodox Servian refugees at the beginning of the 15th century, when the Turks occupied Servia. The numbers of the Serbo-Croats may be estimated at about 5,600,000. The Bulgars, who descend from a fusion of the Slavonic element with a later Ugro-Finnish immigration, inhabit the kingdom of Bulgaria (including Eastern Rumelia), parts of the Dobrudja and the greater part of Macedonia, except Old Servia and the Aegean littoral. Apart from their colonies in Servia and Thrace, they may be reckoned elsewhere in Greece only. A portion of the widely-spread Ruman or Vlach race, which extends over a great part of Transylvania, south Hungary and Bessarabia, as well as the Rumanian kingdom, falls within the limits of the Peninsula. It is found in numerous detached settlements in Macedonia, Albania, and northern Greece, and in colonies of recent date in Servia and Bulgaria. The nomad Vlachs or Tzintzars of these countries call themselves Arumani or "Romans"; they are a remnant of the native Latinized population which received an increase from the immigration of Daco-Roman refugees, who fled southwards during the 3rd century, after the abandonment of Dacia by Aurelian. (See VLACHS.) The entire Ruman population of the Balkan countries may be set down approximately at 600,000. The Albanians, who call themselves Shkupetar or Arber, are the representatives of the primitive Illyrian population; they inhabit the Adriatic littoral, which extends to the western frontier of Montenegro to the southern boundary of Greece, in which country they are found in considerable numbers. They have shown a tendency to advance in a north-easterly direction towards the Servian frontier, and the movement has been encouraged for political reasons by the Turkish government. The whole Albanian nation possibly numbers from 1,500,000 to 3,500,000. The Greeks, whose immigration from Asia Minor took place in pre-historic times, are, next to the Albanians, the oldest race in the Peninsula. Their maritime and commercial instincts have led them from the earliest times to found settlements on the sea-coast and the islands. They inhabit the Black Sea littoral from Varna to the Bosporus, the shores of the Sea of Marmora and the Aegean, the Aegean archipelago, the mainland of Greece, Epirus and the western islands as far north as Corfu. In Constantinople they
probably exceed 300,000. They are seldom found in large numbers at any great distance from the sea, and usually congregate in the principal towns and commercial centres, such as Adrianoile, Constantza, Varna and Philippopolis; there are also detached colonies at Melnik, Staniemaka, Kavakly, Nieghush and elsewhere. The Greek inhabitants of the Peninsula and adjacent islands probably number 4,500,000. The remainder of the population is for the most part composed of Armenians, Jews and gipsies. The Armenians, like the Greeks, congregate in the principal centres of trade, especially at Constantinople; their numbers were greatly reduced by the massacres of 1826. The Jews are most numerous at Salonica where they form half the population. The gipsies are scattered widely throughout the Peninsula; they are found not only in wandering troops, as elsewhere in Europe, but in settlements or cantonments in the neighbourhood of towns and villages.

Religions.—Owing to the numerous conversions to Islam which followed the occupation of the Peninsula by the Turks, the Christian population there is for the most part composed of converts. The predominant religion in the Peninsula is largely in excess of the purely Turkish element. More than half the Albanian nation and 35% of the inhabitants of Bosnia and Herzegovina adopted the creed of the conquering race. Among the Slavs, the Bulgarians have been converted to Islam in large numbers; the Serbs and Montenegrins, as well as the Bulgarian Mahomedans, or Ponaks, who inhabit the valleys of Rhodope and certain districts in northern Bulgaria, are numerically insignificant; the Greek followers of Islam are almost confined to Crete. The Christian population is, however, numerically overwhelming. The Bulgarian church enjoys an exceptional position, inasmuch as its spiritual chief, the exarch, who resides at Constantinople, controls the Bulgarian prelates in European Turkey as well as those in the Kingdom of Bulgaria. On the other hand, the Greek prelates in Bulgaria are subject to the patriarch. Religious and political questions are intimately connected in eastern Europe. The heads of the various religious communities are the only representatives of their sects that have held regular sessions in the Peninsula; they possess a seat in the local administrative councils and supervise the Christian schools. The efforts of the several branches of the Orthodox Church to obtain a separate organization in the Turkish dominions has been frustrated by the political authorities, who regard the difference of dogma as dividing them. The Serbo-Croats of Dalmatia, and Croatia-Slavonia, some of the Gheg tribes in Albania, about 21% of the Bosnians, a still smaller number of Bulgarians in the kingdom and Greeks in both Republics, regard their original religious profession as the Catholic, as the Gregorian and Uniate-Armenian churches, each under a patriarch. The other Christian confessions are numerically inconsiderable. The Gagazis in Eastern Bulgaria, a Turanian and Turkish-speaking race, professing various orthodox or uniate faiths.

Languages.—Until comparatively recent times Turkish and Greek were the only languages systematically taught or officially recognized in the Balkan lands subject to Turkish rule. The first, the speech of the conquered, was taught in the schools, owing to the intellectual and literary superiority of the Greeks, their educational zeal and the privileges acquired by their church, became the language of the upper classes among the Christians. The Slavonic tongue was taught in both Republics by Greek missionaries, who, with their language, which saved these nationalities from extinction. The Servian dialect extending into regions which escaped the Turkish yoke, enjoyed certain advantages denied to the Bulgarian: in former centuries, both in the Servian and Bulgarian tongues was founded in 1493; at Ragusa, a century later, Servian literature attained a high degree of excellence. Bulgarian, for nearly four centuries, ceased to be a written language except in a few monasteries; a literary revival, which began about the middle of the 18th century, was the result of the influence of the Slav-Serbian literature. The Bulgarian and Rumanian languages have borrowed largely from the Turkish in their vocabularies, but not in their structural forms, and have adopted many words from the Greek. Modern Greek has also contributed a great many words to the tongue of the Turks. The true artificial literary language. The revival of the various Balkan nationalities was in each case accompanied or preceded by a literary movement; in Servian literature, under the influence of Obradovich and pilots, the Servian tongue has taken the position of the priesthood, superseded the ecclesiastical Russian-Slavonic; in Bulgaria the eastern dialect, that of the Sredna Gora, prevailed. Among the Greeks, whose literature never suffered a complete eclipse, a similar effort to restore the classical tongue resulted in a kind of compromise; the conventional literary language, which is neither ancient nor modern, differs widely from the vernacular. Albanian, the only surviving remnant of the ancient Thraco-Illryan speech, affords an interesting study to philologists. It undoubtedly belongs to the Indo-European family, but its earlier forms cannot, unfortunately, be ascertained owing to the absence of a few centuries of literary monuments. Certain remarkable analogies between the Albanian and the other languages of the Peninsula, especially Bulgarian and Rumanian, have been supposed to point to the influence exercised by the primitive speech upon the idioms of the immediate races.

History.—The great Slavonic immigration, which changed the ethnographic face of the Peninsula, began in the 3rd century A.D. and continued at intervals throughout the following four centuries. At the beginning of this movement the Byzantine empire was in actual or nominal possession of all the regions south of the Danube; the greater part of the native Thracio-Illryian population of the interior had been romanized and spoke Latin. The Thracians, the progenitors of the Vlachs, who inhabited the mountainous districts, and for some centuries disappeared from history, originally an agricultural people, they became nomad shepherds. In Albania the aboriginal Illyrian element, which preserved its ancient language, maintained itself in the mountains and eventually forced back the immigrant race. The Greeks, who occupied the maritime and southern regions, were driven to the sea-coast, the islands and the fortified towns. Slavonic place-names, still existing in every portion of the Peninsula, bear witness to the multitude of the invaders and the permanency of their settlements. In the 6th century the Slav barbarians crossed the Danube and overran the Peninsula, where a Slavonic dialect was spoken down to the middle of the 15th century. In the 7th the Serbo-Croats invaded the north-western regions (Croatia, Servia, Bosnia, Herzegovina, Montenegro and northern Albania); they expelled or assimilated the Illyrian population, now represented in Dalmatia by the slavonized Morlachs or Mavro-Vlachs, and appropriated the old Roman colonies on the Adriatic coast. At the end of the 7th century the Bulgars, a Turanian race, crossed the Danube and subjected the Slavonic inhabitants of Moesia and Thrace, but were soon assimilated by the conquered population, which had already become partly civilized. Under their tsar Krum (802-815) the Bulgars invaded the districts of Adrianople and central Macedonia; under Simeon (893-927) who fixed his capital at Preslav, their empire extended from the Adriatic to the Black Sea. In 976 the first Bulgarian empire was overthrown by the emperor John Zimisces, but Bulgarian power was soon revived under the Shishman dynasty at Ochrida. In 1014 Tsar Samuel of Ochrida, in revenge for their recent conquests, defeated the Venetians at the battle of Pliska. In 1018 Peter of Slavonia was defeated at Belasitsa by the Greek emperor Basil II., and the "western Bulgarian empire" came to an end. In the 10th century the Vlachs reappeared as an independent power in southern Macedonia and the Pindus district, which were known as Great Walachia (Μεγάλη Βαλασία). The Serbs, who owing to the dissensions of their zupans or chiefs, had hitherto failed to take a prominent part in the history of the Peninsula, attained unity under Stephen Nemanja (1165-1195), the founder of the Nemanjic dynasty. A new Bulgarian power, known as the "second" or "Bulgaro-Vlach empire," was founded at Trnovo in 1186 under the brothers Ivan and Peter Asen, who led a revolt of Vlachs and Bulgars against the Greeks. In 1204 Constantinople was captured by the Latins of the Fourth Crusade, and Baldwin of Flanders was crowned emperor; the Venetians acquired several maritime towns and islands, and Frankish feudal dominions were established in Salonica, Athens, Achaia and elsewhere. Greek rule, however, survived in the despotate of Epirus under the Frankish Comte de Thiene. The empire of the second Bulgaro-Vlach empire of Constantinople lasted only 57 years; the imperial city was recaptured in 1261 by Michael VIII. Palaeologus, but most of the feudal Latin states continued to exist till the Turkish conquest; the Venetians retained their possessions for several centuries later and waged continual wars with the Turks. In 1323 Theodore of Epirus, who had conquered Albania, Great Walachia and Macedonia, was overthrown at Klokotnitza by Ivan Asen II., the greatest of Bulgarian monarchs (1218-1241), who defeated Baldwin at Adrianople and extended his sway over most of the Peninsula. The Bulgarian power declined after
his death and was extinguished at the battle of Vélbízhdz (1330) by the Servians under Stephen Urosh III. A short period of Servian predominance followed under Stephen Dushan (1335-1355) whose realm included Albania, Macedonia, Epirus, Thessaly and northern Greece. The Servian incursion was followed by a great Albanian emigration to the southern regions of the Peninsula. After Dushan's death his empire disappeared, and Servia fell a prey to anarchy. For a short time the Bosnians, under their king Stephen Tvtiko (1353-1391), became the principal power in the west of the Peninsula. The disorganization and internecine feuds of the various states prepared the way for the Ottoman invasion. In 1356 the Turks seized Gallipoli; in 1361 the sultan Murad I. established his capital at Adrianople; in 1380 the fate of the Slavonic states was decided by the rout of the Servians and their allies at Kosovo. The last remnant of Bulgarian national existence disappeared with the fall of Travnik in 1393, and Great Wallachia was conquered in the same year. Under Mahommed II. (1451-1482) the Turks completed the conquest of the Peninsula. The despotate of Epirus succumbed in 1460, the duchy of Athens in 1465; in 1453 Constantinople was taken and the decrepit Byzantine empire perished; the greater part of Bosnia submitted in 1463; the heroic resistance of the Albanians under Scanderbeg collapsed with the fall of Corio (1466), and Venetian supremacy in Upper Albania ended with the capture of Scutari (1478). Only the mountain stronghold of Montenegro and the Italian city-states on the Adriatic coast escaped subjection. In the 16th century under Solyman the Magnificent (1520-1566) the Ottoman power attained its greatest height; after the unsuccessful siege of Vienna (1683) it began to decline. The period of decadence was marked in the latter half of the 18th century by the formation of practically independent pashalis or fevs, such as those of Scutari under Mahommeh of Bushat, Iannina under Ali of Tepelen, and Viden under Pasa-oglu. The detachment of the outlying portions of the empire followed. Owing to the uncompromising character of the Mahometan religion and the contemptuous attitude of the dominant race, the subject nationalities underwent no process of assimilation during the four centuries of Turkish rule; they retained not only their language but their religion, manners and peculiar characteristics, and while the power of the central authority waned they still possessed the germs of a national existence. The independence of Greece was acknowledged in 1829, that of Servia (as a tributary principality) in 1830. No territorial changes within the Peninsula followed the Crimean War; but the continuance of the weakened authority of the Porte tended indirectly to the independent development of the various nationalities. The Ionian Islands were ceded by Great Britain to Greece in 1864. The great break-up came in 1878. The abortive treaty of San Stefano, concluded in that year, reduced the Turkish possessions in the Peninsula to Albania, Epirus, Thessaly and a portion of southern Thrace. A large Bulgarian principality was created extending from the Danube to the Aegean and from the Black Sea to the river Dria in Albania; it included a considerable coast-line on the Aegean and a stretch on the Gulf of Volos under the walls of that town. At the same time the frontiers of Servia and Montenegro were enlarged so as to become almost contiguous, and Montenegro received the ports of Antivari and Dulcigno on the Adriatic. From a strategic point of view the Bulgaria of the San Stefano treaty threatened Salonica, Adrianople and Constantinople itself; and the great powers, anticipating that the new state would become a Russian dependency, refused its sanction to its provisions. The treaty of Berlin followed, which limited the principality to the country between the Danube and the Balkans, created the autonomous province of Eastern Rumelia south of the Balkans, and left the remainder of the proposed Bulgarian state under Turkish rule. The Montenegrin frontier laid down at San Stefano was considerably curtailed, Dulcigno, the district north-east of the Tara, and other territories being restored to Turkey; in addition to Nish, Servia received the districts of Piro and Vranja on the east instead of the Ibar valley on the west; the Dobrudja, somewhat enlarged, was ceded to Rumania which surrendered southern Bessarabia to Russia. Bosnia and Herzegovina were handed over to Austrian administration; under a subsequent convention with Turkey, Austria sent troops into the sanjak of Novibazar. The complete independence of the principalities of Servia, Rumania and Montenegro was recognized. The claims of Greece, ignored at San Stefano, were admitted at Berlin; an extension of frontier, including Epirus as well as Thessaly, was finally sanctioned by the powers in 1880, but owing to the tenacious resistance of Turkey only Thessaly and the district of Arta were acquired by Greece in 1881. Rumania was proclaimed a kingdom in that year, Servia in 1882. In 1880, after a naval demonstration by the powers, Dulcigno was surrendered to Montenegro in compensation for the districts of Plava and Gusiney restored to Turkey. In 1886 the informal union of Eastern Rumelia with Bulgaria was sanctioned by Europe, the districts of Tumrh (Rhodope) and Krajil being given back to the sultan. In 1867 Crete was withdrawn from Turkish administration, and the Greco-Turkish War of that year was followed by the cession to Turkey of a few strategical points on the Thessalian frontier. In 1908 Bosnia and Herzegovina were annexed to the Dual Monarchy, and Bulgaria (including Eastern Rumelia) was proclaimed an independent kingdom.

The growth and development of the Balkan nations have, to a great extent, been retarded by the international jealousies arising from the Eastern Question. The possibility of the young states entering into a combination which would enable them to offer a united resistance to foreign interference while simultaneously effecting a compromise in regard to their national aims, has at various times occupied the attention of Balkan politicians. Among the earliest advocates of this idea was Ristik, the Servian statesman. During the reaction against Russia which followed the war of 1877 informal discussions were conducted with this object, and it was even suggested that a reformed or constitutional Turkey might find a place in the confederation. The movement was revived by the Young Turks under the leadership of Cemal Pasvan-Oghlu (1830), and the idea was taken up by the Servian statesman. But the revolt of Eastern Rumelia, followed by the Servo-Bulgarian War and the coercion of Greece by the powers, emblazoned the rivalry of the various races, and the project was laid aside. It was revived in a somewhat modified form in 1901 by Tricopis, who suggested an offensive alliance of the Balkan states, directed against Turkey and aiming at a partition of the Sultan's possessions in Europe. The scheme, which found favour in Servia, was frustrated by the opposition of Stamboloff, who denounced it to the Porte. In 1897 a Bulgarian proposal for joint pacific action with a view to obtaining reforms in Macedonia was rejected by Greece.

(J. D. B.)
BALKASH, or Balkhash (called by the Kirghiz Ak-denghiz or Ala-denghiz and by the Chinese Si-ho), a lake of Asiatic Russia, in the Kirghiz steppes, between the governments of Semipalatinsk and Semirechensk, in 45° to 47° N. and 72° to 79° E., about 600 m. to the east of Lake Aral. It is four in size of the lakes in Eurasia, having an area of 7115 sq. m., and lies at an altitude of 900 ft. It has the shape of a broad crescent, about 430 m. long from W.S.W. to E.N.E., having its concave side turned southwards; its width varies from 36 to 53 m. Its north-western shore is bordered by a dreary plateau, known as the Famine Steppe (Bek-pak-dalo). The south-east shore, on the contrary, is low, and bears traces of having extended formerly as far as the Sasyk-kul and the Ala-kul. The Kirghiz in 1903 declared that its surface had been rising steadily during the preceding ten years, though prior to that it was dropping. The chief feeder of the lake is the Ili, which rises in the Khandenghiz group of the Tien Shan Mountains. The Karatal, the Aksu and the Lespa also enter from the south-east, and the Ayaguz from the north-east. The first three rivers make their way with difficulty through the sands and reeds, which at a quite recent time were covered by the lake. Although it has now receded these waters are partially fresh. It rains from November to April. Its greatest depth, 35 ft., is along the north-western shore. The fauna of the lake and of its tributaries —explored by Nikolsky—is more akin to the fauna of the rivers of the Tarim basin than to that of the Aral; it also does not contain the common frog. It seems, therefore, probable that Lake Balkhash stood formerly in communication through lakes Ebi-nor and Ayar (Telli-nor) with the lake that formerly filled the Lukshun depression (in 89° E. long. and 42° N. lat.), but researches show that a connexion with Lake Aral—at least in recent times—was improbable. The lake has been investigated by L. S. Berg (see *Petermanns Mitteilungen*, 1903).

**Balkh,** a city of Afghanistan, about 100 m. E. of Andkhui and some 46 m. S. of the Oxus. The city, which is identical with the ancient Bactria or Zainaspa, is now for the most part a mass of ruins, situated on the right bank of the Balkh: river, 1200 ft. above the sea. It comprises about 500 houses of Afghan settlers, a colony of Jews and a small bazaar, set in the midst of a waste of ruins and many acres of débris. Entering by the west (or Ar-Rustam) gate, one passes under a roof, which is probably the remnants of a former Juma Masjid. The outer walls (mostly in utter disrepair) are about 64 to 7 m. in perimeter, and on the south-eastern borders are set high on a mound or rampart, indicating a Mongol origin. The fort and citadel to the north-east are built well above the town on a barren mound and are walled and moated. There is, however, left but the remains of a few pillars. The Masjid Sabz, with its green-tiled dome, is said to be the tomb of a Khwaja, Abu Narsi Parsar. Nothing but the arched entrance remains of the Madrasa, which is traditionally not very old. The earlier Buddhist constructions have proved more durable than the Mahomedan buildings. The Top-i-Rustam is 50 yds. in diameter at the base and 30 yds. at the top, circular and about 50 ft. high. Four circular vaults are sunk in the interior and four passages have been pierced below from the outside, which probably lead to them. The base of the building is constructed of sun-dried bricks about 2 ft. square and 4 or 5 in. thick. The Top-i-Rustam is wedge-shaped in plan, with uneven sides. It is apparently built of pisé mud (i.e., mud mixed with straw and puddled). It is possible that in these ruins we may recognize the Nan Vihar of the Chinese traveller Hišan Tsang. There are the remains of many other topos (or stupas) in the neighbourhood. The mounts of ruins on the road to Mazari-Sharif probably represent the site of a city yet older than those on which stands the modern Balkh. The town is garrisoned by a few hundred kasiders, the regular troops of Afghan Turkestân being cantoned at Takhtapul, near Mazari-Sharif. The gardens to the north-east contain a caravanserai, which is fairly well kept and comfortable. It forms one side of a courtyard, which is shaded by a group of magnificent caner trees.

The antiquity and greatness of the place are recognized by the native populations, who speak of it as the *Mother of Cities*. Its foundation is mythically ascribed to Kiamurs, the Persian Rómulus; and it is at least certain that, at a very early date, it was the rival of Ephesiana, Nineveh and Babylon. For a long time the city and country was the central seat of the Zoroastrian religion, the founder of which is said to have died within the walls. From the *Memoirs of Hsien Tsang*, we learn that, at the time of his visit in the 7th century, there were in the city, or its vicinity, about a hundred Buddhist convents, with 3000 devotees, and that there was a large number of stupas, and other religious monuments. The most remarkable was the *Nau Behar, Nava Bihora or New Convent*, which possessed a very costly statue of Buddha. A curious notice of this building is found in the Arabian geographer Yaqít. Ibn-Haukal, an Arabian traveller of the 10th century, describes Balkh as built of clay, with ramparts and six gates, and extending half a parasang. He also mentions a castle and a mosque. Torisli, in the 12th century, speaks of its possessing a variety of educational establishments, and carrying on an active trade. There were several important commercial routes from the city, stretching as far east as India (or at least to the Indus). In 1270 Jenghiz Khan sacked Balkh, butchered its inhabitants, and erected his castles capable of defence; the treatment to which it was again subjected under the Turks was carried by Timur. Notwithstanding this, however, Marco Polo can still, in the following century, describe it as "a noble city and a great." Balkh formed the government of Auranzegh in his youth. In 1736 it was conquered by Nadir Shah. Under the Durani monarchy it fell into the hands of the Afghans; it was conquered by Shah Murad of Kunuz in 1820, and for some time was subject to the khan of Bokhara. In 1850 Mahmomed Akram Khan, Barakzai, captured Balkh, and from that time it remained under Afghan rule.

See *Hišan Tsang*, tr. by Julien, vol. i. pp. 29-32; *Burnes's Travels in Bokhara* (1831-1833); *Ferrier's Travels*; *Vambah's Bokhara* (1873); *Report of the Russo-Afghan Boundary Commission* of 1884-1885. (T. H. H.)

**Ball, Sir Alexander John, Bart.** (1759-1800), British rear-admiral and governor of Malta, came of a Gloucestershire family. He entered the navy, and in 1778 was promoted lieutenant. Three years later began a close association with Rodney, and two years after his chief's victorious victory of April 12, 1782, Ball was promoted commander, and in 1785 he became captain. At this time he spent a year in France with the double purpose of learning the language and living economically. Nelson, then a captain, was at this time by no means favourably impressed by his future friend and comrade, and spoke of him as a "great coxcomb." It was not until 1790 that Ball received a command. From that year, however, he was continuously employed. In 1798, assistance rendered by him to Nelson's ship in heavy weather caused the latter to forget his former animosity, and from that time the two were close friends. Under Nelson's command Ball took part in the battle of the Nile, and his ship, the "Alexander," was the particular opponent of Brueys' flagship, "L'Orient," which blew up. Two months later he was ordered to the blockade of Malta, which was kept up without a break for the next two years. Ball committed the blockade to his first lieutenant, and himself led the marines and local militia, which made the siege on the land side. His care for his men laid the foundations of his popularity with the Maltese which continued till his death. After Nelson's death Ball was sent to Malta to take over the service, in spite of Nelson's urgent entreaty that he should continue afloat, and from 1801 (when he was made a baronet) to 1809 he was governor of Malta, where he endeared himself to the people by his regard for their interests, and his opposition to the policy of treating the island as a conquered dependency. His friendship with Lord Nelson, whose letters prove his high regard for him, was only broken by death. Ball died on the 20th of October 1809 and was buried at Malta. Sir Alexander Ball was kind to Corderidge and is highly praised by him in *The Friend*, "The Third Landing Place." There are numerous mentions of Ball in Nelson's *Despatches*, in Sir H. Nicolas' editions.
BALL, John (d. 1381), an English priest who took a prominent part in the peasant revolt in 1381. Little is known of his early years, but he lived probably at York and afterwards at Colchester. He gained considerable fame as a preacher by expounding the doctrines of John Wycliffe, but especially by his insistence on the principle of social equality. These utterances brought him into collision with the archbishop of Canterbury, and on three occasions he was committed to prison. He appears also to have been excommunicated, and in 1366 all persons were forbidden to hear him preach. His opinions, however, were not moderated, and his popularity diminished by these measures, and his words had a considerable effect in stirring up the rising which broke out in June 1381. Ball was then in prison at Maidstone; but he was quickly released by the Kentish rebels, to whom he preached at Blackheath from the text, "When Adam delved and Eve span, Who was then a gentleman?" He urged his hearers to kill the principal lords of the kingdom and the lawyers; and he was afterwards among those who rushed into the Tower of London to seize Simon of Sudbury, archbishop of Canterbury. When the rebels dispersed Ball fled to the midland counties, but was taken prisoner at Coventry and executed in the presence of Richard II. on the 15th of July 1381. Ball, who was called by Froissart "the mad priest of Kent," seems to have possessed the gift of rhyme. He undoubtedly voiced the feelings of the lower orders of society at that time.

BALL, John (1585-1640), English puritan diver, was born at Cattistock, Dorsetshire, in October 1585. After taking his B.A. degree from St. Mary's Hall, Oxford, in 1608, he went into Cheshire to act as tutor to the children of Lady Cholmondeley. He adopted Puritan views, and after being ordained without subscription, was appointed assistant-magistral curacy of Whitmore in Staffordshire. He was soon deprived by John Bridgeman, the high church bishop of Chester, who put him to much suffering. He became a schoolmaster and earned a wide and high reputation for his scholarship and piety. He died on the 20th of October 1640. The most popular of his numerous works was A Short Catechism, containing all the Principal Grounds of Religion (14 editions before 1632). His Treatise of Faith (1632), and Friendly Trial of the Grounds tending to Separation (1640), the latter of which defines his position with regard to the church, are also valuable.

BALL, John (1818-1880), Irish politician, naturalist and Alpine traveller; eldest son of an Irish judge, Nicholas Ball, was born at Dublin on the 20th of August 1818. He was educated at the Roman Catholic College at Oscott near Birmingham, and at Christ's College, Cambridge. He showed in early years a taste for natural science, particularly botany; and after leaving college he travelled in Switzerland and elsewhere in Europe, studying his favourite pursuits, and contributing papers on botany and the Swiss glaciers to scientific periodicals. In 1846 he was made an assistant poor-law commissioner, but resigned in 1847, and in 1848 stood unsuccessfully as a parliamentary candidate for Sligo. In 1849 he was appointed second poor-law commissioner, but resigned in 1852 and successfully contested the county of Carlow in the Liberal interest. In the House of Commons he attracted Lord Palmerston's attention by his abilities, and in 1855 was made under-secretary for the colonies, a post which he held for years. At the colonial office he had great influence in furthering the cause of natural science, particularly in connexion with equipment of the Palliser expedition in Canada, and with Sir W. Hooker's efforts to obtain a systematic knowledge of the colonial floras. In 1858 he stood for Limerick, but was beaten, and he then gave up politics and devoted himself to natural history. He was first president of the Alpine Club (founded 1857), and it is for his work as an Alpinist that he is chiefly remembered, his well-known Alpine Guide (London, 1863-1868) being the result of innumerable climbs and journeys and of careful observation recorded in a clear and often entertaining style. He also travelled in Morocco (1871) and South America (1882), and recorded his observations in books which were recognized as having a scientific value. He died in London on the 21st of October 1889.

BALL, Thomas (1819— ), American sculptor, was born at Charlestown, Massachusetts, on the 3rd of June 1819. He was the son of a house-and-sign-painter, and after starting, self-taught, as a portrait painter he turned his attention in 1851 to sculpture, his earliest work being a bust of Jenny Lind. At thirty-five he went to Florence for study; there, with an interval of work in Boston, Massachusetts, in 1857-1865, he remained for more than thirty years, being one of the artistic colony which included the Brownings and Hiram Powers. He returned to America in 1869, and lived in Montclair, New Jersey, with a studio in New York City. His work includes many early cabinet busts of musicians (he was an accomplished musician himself, and was the first in America to sing "Elijah"), and later the equestrian statue of Washington in the Boston public gardens, probably his best work; Josiah Quincy in City Hall Park, Boston; Charles Sumner in the public gardens of Boston; Daniel Webster in Central Park, New York City; the Lincoln Emancipation group at Washington; Edwin Forrest as "Coriolanus," in the Actors' Home, Philadelphia, and the Washington monument in Methuen, Massachusetts. His work has had a marked influence on monumental art in the United States and especially in New England. In 1801 he published an autobiographical volume, My Three Score Years and Ten.

BALL (in Mid. Eng. bal; the word is probably cognate with "bale," Teutonic in origin, cf. also Lat. fella, and Gr. πᾶλλα), any rounded body, particularly one with a smooth surface, whether used for games, as a missile, or applied to such rounded bodies as the protuberance at the root of the thumb or the big toe, to an enthrasies, or "ball socket " joint, such as that of the hip or shoulder, and the like. A ball, as the essential feature in nearly every form of game requiring physical exertion, must date from the very earliest times. A rolling object appeals not only to a human baby but to a kitten and a puppy. Some form of game with a ball is found portrayed on Egyptian monuments, and is played among the least advanced of savage tribes at the present day. In Homer, Nausicaa was playing at ball with her maidens when Odysseus first saw her in the land of the Phaeacians (Od. vi. 100). And Halios and Laodamas performed before Alcinous and Odysseus with ball play, accompanied with dancing (Od. viii. 370). The Hebrews, the least athletic of races, have no mention of the ball in their scriptures. Among the Greeks games with balls (φαίνα) were regarded as a useful subsidiary to the more violent athletic exercises, as a means of keeping the body supple, and rendering it graceful, but were generally left to boys and girls. Similarly at Rome they were looked upon as an adjunct to the bath, and were graduated to the age and health of the bathers, and usually a place (σφαιριστήριον) was set apart for them in the thermae. Of regular rules for the playing of ball games, little trace remains; the ball was any round object, and rules in Greek for various forms, which have come down to us in such works as the 'Onomastikoi of Pollux of Naucrotis, imply little or nothing of such; thus, ἄνδρονκας only means the putting of the ball on the ground with the open hand, ορωναὶ the flinging of the ball in the air to be caught by two or more players; φαίναβα would seem to be a game of catch played by two or more, where feinting is used, as a test of quickness and skill. Pollux (i. x. 104) mentions a game called ἐκάκιος, which has often been looked on as the origin of football. It seems to have been played by two sides, arranged in lines; how far there was any form of "goal" seems uncertain. Among the Romans there appear to have been three types or sizes of ball, the pilis, or small ball, used in catching games, the pagania, a heavy ball stuffed with feathers, and the folis, a leather ball filled with air, the largest of the three. This was struck from player to player, who wore a kind of gauntlet on the arm. There was a game known as trigon, played by three players standing in
BALLADE—BALLADS

the form of a triangle, and played with the foliis, and also one known as harkastum, which seems to imply a "scrimmage" among several players for the ball.¹ These games are known to us through the Romans, though the names are Greek. The various modern games played with a ball or balls and subject to rules are treated under their various names, such as polo, cricket, football, &c.

From Fr. bal, balleter, to dance (late Lat. ballare, and hence connected with "ballard," "ball") comes "ball," meaning a dance, and especially a social gathering of people for the purpose of dancing.

BALLADE, the technical name of a complicated and fixed form of verse, arranged on a precise system, and having nothing in common with the word ballad, except its derivation from the same Low Latin verb, ballare, to dance. In the 14th and 15th centuries it was spelt balade. In its regular conditions a ballade consists of three stanzas, the last verse (la dernière chanson) is a refrain which is repeated at the close of each stanza and of the envoi. The entire poem should contain but three or four rhymes, as the case may be, and these must be reproduced with exactitude in each section. These rules were laid down by Henri de Crécy, whose L'Art et science de rhétorique was first printed in 1493, and he added that if the refrain consists of eight syllables, the ballade must be written in huitains (eight-line stanzas), if of ten syllables in dizains (ten-line), and so on. The form can best be studied in an example, and we quote, as absolutely faultless in execution, the famous "Ballade aux Enfants Perdus," composed by Théodore de Banville in 1861:—

"Je le sais bien que Cythère est en deuil!
Que son jardin, souillé par l'orage,
O mes amis, n'est plus qu'un sombre écueil
Agnons sous le soleil sauvage.
La solitude habite son rivage.
Qu'importe! allons vers les pays fictifs!
Cherchons la plâtre où nos désirs osés
S'abreuvent dans le sacré mystère.
Fait pour un chœur d'esprits contemplatifs;
Embarquons-nous pour la belle Cythère.

"La grande mer sera notre cercueil;
Nous servirons de proie au noir naufrage,
Le feu du ciel punira notre orgueil
Et l'aiguillon nous guidera son outrage.
Qu'importe! allons vers le clair paysage!
Malgré la mer jalouse et les râcis,
Venez, portons comme des fugitifs,
Loin de ce monde au soufre délétère.
Nous dont les cœurs sont des ramiers plaintifs,
Embarquons-nous pour la belle Cythère.

"Des serpents gris se trafics sur le seuil,
Où souriait Cypris, la chère image
Aux tresses d'or, la vierge au doux accueil!
Mais les Amours sur le plus haut cordage
Nou chantèrent l'amour, sous le ciel du bâyeau:
Héros cachés dans ces corps maladifs,
Fuyons, partons sur nos légers esquis,
Vers le divin bocage où la pantèche
Pleure d'amour sous les rosiers lancés;
Embarquons-nous pour la belle Cythère.

Envoi.

Rassasions d'azur nos yeux pensifs!
Oiseaux chanteurs, dans la brise expansifs,
Ne souillons pas nos alées sur la terre.
Volons, charmés, vers les dieux primitifs;
Embarquons-nous pour la belle Cythère."

This is the type of the ballade in its most elaborate and highly finished form, which it cannot be said to have reached until the 14th century. It arose from the canzone, and especially from the canzone de ballo of the Italians, but it is in Provencal literature that the ballade first takes a modern form. It was in France, however, and not until the reign of Charles V., that the ballade as we understand it began to flourish; instantly it became popular, and in a few years the out-put of these poems was incalculable. Machault, Froissart, Eustache Deschamps and Christine de Pisan were among the poets who cultivated the ballade most abundantly. Later, those of Alain Chartier and Henri Baude were famous, while the form was chosen by François Villon for some of the most admirable and extraordinary poems which the middle ages have handed down to us. Somewhat later, Clément Marot composed ballades of great precision of form, and the fashion culminated in the 15th century with those of Madame Deshoulières, Sarrazin, Voiture and La Fontaine. Attacked by Molière, and by Boileau, who wrote

"La ballade asservie à ses vieilles maximes,
Souvent doit tout son lustre au caprice des rimes,"

the ballade went entirely out of fashion for two hundred years, when it was resuscitated in the middle of the 15th century by Théodore de Banville, who published in 1873 a volume of Trente-six ballades joyeuses, which has found many imitators. The ballade, a typically French form, has been extensively employed in no other language, except in English. In the 15th and 16th centuries most ballades were more or less close attention to the French rules, by the leading English poets, and in particular by Chaucer, by Gower (whose surviving ballades, however, are all in French) and by Lydgate. An example from Chaucer will show that the type of strophe and rhyme arrangement was in medieval English:—

"Madame, ye been of all beauty shyne
As far as circled is the mappemound;
For, as the crystal, glorious ye shine,
And like ruby been your cheeks round,
Therewith ye been so merry and so jocund
That at a revel when that I see you dance,
It is an oinment unto my wound,
Though ye to me ye do no daunces.

"For though I weep of tears full a tine [cask],
Yet may thar woe my heart not confound;
Your seamy voice, that ye so small out-twine,
Maketh my thought in joy and bliss abound.
So courteously I go, with foy bound,
That to myself I say, in my pensance
Sufficeth me to love you, Rosamond,
Though ye to me ne do no daunces.

"Was never pike wallowed in galantine,
As I in love am wallowed and y-wound;
For which full oft I of myself divine
That I am true Triamond the second.
My love may not refrayed [cooled down] be nor a-ford
I burn ay in an amorous pleasance. [founded];
Do what you list, I will your thral be found,
Though ye to me ne do no daunces."

The absence of an envoi will be noticed in Chaucer's, as in most of the medieval English ballades. This points to a relation with the earliest French form, in its imperfect condition, rather than with that which afterwards became accepted. But a ballade without an envoi lacks that section whose function is to tie together the rest, and complete the whole as a work of art. After the 16th century original ballades were no more or less close attention to the French rules, by the leading English poets, and in particular by Chaucer, by Gower (whose surviving ballades, however, are all in French) and by Lydgate. An example from Chaucer will show that the type of strophe and rhyme arrangement was in medieval English:

"Madame, ye been of all beauty shyne
As far as circled is the mappemound;
For, as the crystal, glorious ye shine,
And like ruby been your cheeks round,
Therewith ye been so merry and so jocund
That at a revel when that I see you dance,
It is an oinment unto my wound,
Though ye to me ye do no daunces.

"For though I weep of tears full a tine [cask],
Yet may thar woe my heart not confound;
Your seamy voice, that ye so small out-twine,
Maketh my thought in joy and bliss abound.
So courteously I go, with foy bound,
That to myself I say, in my pensance
Sufficeth me to love you, Rosamond,
Though ye to me ne do no daunces.

"Was never pike wallowed in galantine,
As I in love am wallowed and y-wound;
For which full oft I of myself divine
That I am true Triamond the second.
My love may not refrayed [cooled down] be nor a-ford
I burn ay in an amorous pleasance. [founded];
Do what you list, I will your thral be found,
Though ye to me ne do no daunces."

This is the type of the ballade in its most elaborate and highly finished form, which it cannot be said to have reached until the 14th century. It arose from the canzone, and especially from the canzone de ballo of the Italians, but it is in Provencal literature that the ballade first takes a modern form. It was in France, however, and not until the reign of Charles V., that the ballade as we understand it began to flourish; instantly it became popular, and in a few years the out-put of these poems was incalculable. Machault, Froissart, Eustache Deschamps and Christine de Pisan were among the poets who cultivated the ballade most abundantly. Later, those

¹ Martial (iv. 19. 6) calls the harkastum, pulvcrulentum, implying that it involves a considerable amount of exertion.
recurring rhymes. “Laisse moi aux Jeux Floraux de Toulouse toutes ces vieus poésies François comme ballades,” says Joachim du Bellay in 1550; and Philastre, the lady pedant of Molière’s Femmes Savantes, observes—

“Ce n’en est plus la mode, elle sent son vieux temps.”

In England the term has usually been applied to any simple tale told in simple verse, though attempts have been made to confine it to the subject of this article, namely, the literary form of popular songs, the folk-tunes associated with them being treated in the article Song. By popular songs we understand what the Germans call Volkslieder, that is, songs with words composed by members of the people, for the people, handed down by oral tradition, and in style, taste and even incident, common to the people in all European countries. The beauty of these purely popular ballads, their directness and freshness, has made them admired even by the artificial critics of the most artificial periods in literature. Thus Sir Philip Sydney confesses that the ballad of Chevy Chase, when chanted by “a blind crowder,” stirred his blood like the sound of trumpet. Addison devoted two articles in the Spectator to a critique of the same poet, and praised the naïveté of the village carols; and Malherbe preferred a rustic chansonnette to all the poems of Ronsard. These, however, are rare instances of the taste for popular poetry, and though the Danish ballads were collected and printed in the middle of the 16th century, and some Scottish collections date from the beginning of the 18th, it was not till the publication of Allan Ramsay’s Evergreen and Tea Table Miscellany, and of Bishop Percy’s Reliques (1765), that a serious effort was made to recover Scottish and English folk-songs from the recitation of the old people who still knew them by heart. At the time when Percy was editing the Reliques, Madame de Chénier, the mother of the celebrated French poet of that name, composed an essay on the ballads of her native land, modern Greece; and later, Herder and Grimm and Goethe, in Germany, did for the songs of their country what Scott did for those of Liddesdale and the Forest. It was fortunate, perhaps, for poetry, though unlucky for the scientific study of the ballads, that they were mainly regarded from the literary point of view. The influence of their artless melody and straightforward diction may be felt in the lyrics of Goethe and of Coleridge, of Wordsworth, of Heine and of André Chénier. Chénier, in the most affected age even of French poetry, translated some of the Romanic ballads; one, as it chanced, being almost identical with that which Shakespeare borrowed from some English reciter, and put into the mouth of the mad Ophelia. The beauty of the ballads and the interest they excited led to numerous forgeries and modern interpolations, which it is seldom difficult to detect with certainty. Editors could not resist the temptation to interpolate, to restore, and to improve the fragments that came in their way. The marquis de Villemarqué, who first drew attention to the ballads of Brittany, is not wholly free from this fault. Thus a very general scepticism was awakened, and when questions came to be asked as to the date and authorship of the Scottish traditional ballads, it is scarcely to be wondered at that Dr Chambers attributed most of them to the accomplished Lady Wardlaw, who lived in the middle of the 18th century.

The vexed and dull controversy as to the origin of Scottish folk-songs was due to ignorance of the comparative method, and of the ballad literature of Europe in general. The result of the discussion was to leave a vague impression that the Scottish ballads were perhaps as old as the time of Dunbar, and were the production of a class of professional minstrels. These minstrels are a stumbling-block in the way of the student of the growth of ballads. The domestic annals of Scotland show that her kings used to keep court-bards, and also that strollers, jongleurs, as they were called, went about singing at the doors of farm-houses and in the streets of towns. Here were two sets of minstrels who had apparently left no poetry; and, on the other side, there was a number of ballads that claimed no author. It was the easiest and most satisfactory inference that the courtly minstrels made the verses, which, the wandering crowders

IMITATED OR CORRUPTED. BUT THIS THEORY FAILS TO ACCOUNT, AMONG OTHER THINGS, FOR THE UNIVERSAL SAMENESS OF TONE, OF INCIDENT, OF LEGEND, OF PRIMITIVE POETICAL FORMULAE, WHICH THE SCOTTISH BALLADS POSSESS, IN COMMON WITH THE BALLADS OF GREECE, OF FRANCE, OF PROVENCE, OF PORTUGAL, OF DENMARK AND OF ITALY. THE OBJECT, THEREFORE, OF THIS ARTICLE IS TO PROVE THAT WHAT HAS LONG BEEN ACKNOWLEDGED OF NURSERY TALES, OF WHAT THE GERMANS CALL MÄRCHEN, NAMELY, THAT THEY ARE THE IMMORNERNAL INHERITANCE AT LEAST OF ALL EUROPEAN PEOPLES, IS TRUE ALSO OF SOME BALLADS. THEIR PRESENT FORM, OF Course, IS RELATIVELY RECENT: IN CENTURIES OF ORAL RECEPTION THE LANGUAGE ALTERED AUTOMATICALLY, BUT THE STOCK SITUATIONS AND IDEAS OF MANY ROMANTIC BALLADS ARE OF DATELESS AGE AND WORLD-WIDE DIFFUSION. THE MAIN INCIDENTS AND PLOTS OF THE FAIRY TALES OF CELTS AND GERMANS AND SLAVONIC AND INDIANPEOPLES, THEIR UNKNOWN ANTIQUITY AND MYSTERIOUS ORIGIN, ARE UNIVERSALLY RECOGNIZED. NO ONE ANY LONGER ATTRIBUTES THEM TO THE OR THAT AUTHOR, OR TO THIS OR THAT DATE. THE ATTEMPT TO FIND DATE OR AUTHOR FOR A GENUINE POPULAR SONG IS AS FUTILE AS A SIMILAR SEARCH IN THE CASE OF A MÄRCHEN. IT IS TO BE ASKED, THEN, WHETHER WHAT IS CONFESSIONALLY TRUE OF FAIRY TALES,—OF SUCH STORIES AS THE SLEEPING BEAUTY AND CINDERELLA,—IS ALSO TRUE OF POPULAR SONGS. ARE THEY, OR HAVE THEY BEEN, AS UNIVERSALLY SONG-TALES HAVE BEEN NARRATED? DO THEY, TOO, BARE TRACES OF THE SURVIVAL OF PRIMITIVE CREEDS AND PRIMITIVE FORMS OF CONSCIOUSNESS AND OF IMAGINATION? ARE THEY, LIKE MÄRCHEN, FOR THE MOST PART, LITTLE INFLUENCED BY THE HIGHER RELIGIONS, CHRISTIAN OR POLYTHEISTIC? DO THEY TURN, AS MÄRCHEN DO, ON THE SAME INCIDENTS, REPEAT THE SAME STORIES, EMPLOY THE SAME MACHINERY OF TALKING BIRDS AND BEASTS? LASTLY, ARE ANY SPECIMENS OF BALLAD LITERATURE CAPABLE OF BEING TRACED BACK TO EXTREME ANTIQUITY? IT APPEARS THAT ALL THESE QUESTIONS MAY BE ANSWERED IN THE AFFIRMATIVE; THAT THE GREAT AGE AND WORLD-WIDE DIFFUSION OF THE BALLAD MAY BE PROVED; AND THAT ITS BIRTH, FROM THE LIPS AND HEART OF THE PEOPLE, MAY BE CONTRASTED WITH THE ORIGIN OF AN ARTISTIC POETRY IN THE DEMAND OF AN ARISTOCRACY FOR A SEPARATE EPIC LITERATURE DESIGNED TO BE ITS OWN POSSESSION, AND TO BE THE FIRST DEVELOPMENT OF A POETRY OF PERSONALITY,—A RECORD OF INDIVIDUAL PassIONS AND EMOTIONS. AFTER BRINGING FORWARD EXAMPLES OF THE IDENTITY OF FEATURES IN EUROPEAN BALLAD POETRY, WE SHALL PROCEED TO SHOW THAT THE EARLIER GENRE OF BALLADS WITH REFRAIN SPRANG FROM THE SAME PRIMITIVE CUSTOM OF DANCE, ACCOMPANIED BY SINGING, WHICH EXISTS IN GREECE AND RUSSIA, AND EVEN IN VALLEYS OF THE PYRENEES.

There can scarcely be a better guide in the examination of the notes or marks of popular poetry than the instructions which M. Ampère gave to the committee appointed in 1852-1853 to search for the remains of ballads in France. M. Ampère bade the collectors look for the following characteristics:—“The use of assonance in place of rhyme, the brusque character of the recital, the textual repetition, as in Homer, of the speeches of the persons, the constant use of certain numbers,—as three and seven,—and the representation of the commonest objects of every-day life as being made of gold and silver.” M. Ampère might have added that French ballads would probably employ a “bird chorus,” the use of talking-birds as messengers; that they would repeat the plots current in other countries, and display the same non-Christian idea of death and of the future world (see Thé Lyke-wake Dirge 1 1 1), the same ghastly superstitions and tales of metamorphosis, and the same belief in elves and fairies, as are found in the ballads of Greece, of Provence, of Brittany, Denmark and Scotland. We shall now examine these supposed common notes of all genuine popular song, supplying a few out of the many instances of curious identity. As to brusqueness of recital, and the use of assonance instead of rhyme, as well as the aid to memory given by reproducing speeches verbally, these are almost unavoidable in all simple poetry preserved by oral tradition. In the matter of recurring numbers, we have the eternal—

“ Trois belles filles,
L’Y en a z’une plus belle que le jour,”

who appear in old French ballads, as well as the “Three Sailors,” whose adventures are related in the Lithuanian and Provençal originals of Thackeray’s Little Billee. Then there is the league,
the league, the league, but barely three,” of Scottish ballads; and the *träd toulad*, three golden birds, which sing the prelude to Icelandic folk-songs, and so on. A more curious note of primitive poetry is the lavish and reckless use of gold and silver. H. F. Tozer, in his account of ballads in the *Highlands of Turkey*, remarks on this fact, and attributes it to Eastern influences. But the horses’ shoes of silver, the knives of fine gold, the talking “birds with gold on their wings,” as in *Arystophanes*, are common to all folk-song. Everything almost is gold in the *Kalewala* (*q.v.*), a so-called epic formed by putting into juxtaposition all the popular songs of Finland. Gold is used as freely in the ballads, real or spurious, which M. Verkvitch has had collected in the wilds of Mount Rhodope. *The Captain in the French song* is as lavish in his treatment of his runaway bride,—

“Son amant l’habille.
Tout en or et argent”;

and the rustic in a song from Poitou talks of his *faucille d’or*, just as a variant of Hugh of Lincoln introduces gold chairs and tables. Again, when the lover, in a ballad common to France and to Scotland, cuts the winding-sheet from about his living bride—“il tira ses ciseaux d’or fin.” If the horses of the Klephs in Romain ballads are gold shod, the steed in *Wille’s Lady* is no less splendidly accoutred—

“Silver shod before.
And gowden shod behind.”

Readers of Homer, and of the *Chanson de Roland*, must have observed the same primitive luxury of gold in these early epics, in Homer reflecting perhaps the radiance of the actual “golden Mycenae.”

Next as to talking-birds. These are not so common as in *Märchen*, but still are very general, and cause no surprise to their human listeners. The omniscient popinjay, who “up and spoke” in the Border minstrelsy, is of the same family of birds as those that, according to Tavly, pervade Servian song; as the *träd toulad* which introduce the story in the Romain ballads; as the wise birds whose speech is still understood by exceptionally gifted Zulus; as the wicked dove that whispers temptation in the sweet French folk-song; as the “bird that came out of a bush, on water for to dine,” in the *Water o’ Wotries Well*.

In the matter of identity of plot and incident in the ballads of various lands, it is to be regretted that no such comparative tables exist as Von Hahn tried, not very exhaustively, to make of the “story-roots” of *Märchen*. Such tables might be compiled from the learned notes and introductions of Prof. Child to his *English and Scottish Popular Ballads* (1898). A common plot is the story of the faithful leman, whose lord brings home “a braw new bride,” and who recovers his affection at the eleventh hour. In Scotland this is the ballad of Lord Thomas and Fair Annie; in Danish it is *Skiaan Anna*. It occurs twice in M. Fauriel’s collection of Romain songs. Again, there is the familiar ballad about a girl who pretends to be dead, that she may be borne on a bier to meet her lover. This occurs not only in Scotland, but in the popular songs of Provence (collected by Damase Arbaud) and in those of Meta (Puymaire), and in both countries an incongruous sequel tells how the lover tried to murder his bride, and how he was taken unawares, and drowned him. Another familiar feature is the bush and brier, or the two rose trees, which meet and plait over the graves of unhappy lovers, so that all passers-by see them, and say in the Provençal,—

“Dieu ague l’amor
Des paures amouros.”

Another example of a very widespread theme brings us to the ideas of the state of the dead revealed in folk-songs. *The Night Journey*, in M. Fauriel’s Romain collection, tells how a dead brother, wakened from his sleep of death by the longing of love, bore his living sister on his saddle-bow, in one night, from Bagdad to Constantinople. In Scotland this is the story of *Proud Lady Margaret*; in Germany it is the song which Bürger converted into Lenore; in Denmark it is *Aagé und Elsé*; in Brittany the dead foster-brother carries his sister to the apple close of the Celtic paradise (*Barbas Breia*). Only in Brittany do the sad-hearted people think of the land of death as an island of Avalon, with the eternal sunset lingering behind the flowering apple trees, and gleaming on the fountain of forgetfulness.

In Scotland the channering worm doth chide even the souls that come from where, “beside the gate of Paradise, the birk grows fair enough.” The Romaine idea of the place of the dead, the garden of Charon, whence “neither in spring or summer, nor when grapes are gleaned in autumn, can warrior or maiden escape” is likewise pre-Christian. In Provençal and Danish folk-song, the cries of children ill-treated by a cruel step-mother awaken the departed mother,—

“Twas cold at night and the bairnies grat.
The mother below the moulis heard that.”

She reappears in her old home, and henceforth, “when dogs howl in the night, the step-mother trembles, and is kind to the children.” To this identity of superstition we may add the less tangible fact of identity of tone. The ballads of Klephic exploits in Greece match the border songs of Dick of the Cow and Kinmont Willie. The same simple delight of living animates the short Greek *Scotia* and their counterparts in France. Everywhere in these happier climes, as in southern Italy, there are snatches of popular verse that make but one song of rose trees, and apple blossom, and the nightingale that sings for maidens loverless,—

“Il ne chante pas pour moi,
J’en ai un, Dieu merci,”

says the gay French refrain.

It would not be difficult to multiply instances of resemblance between the different folk-songs of Europe; but enough has, perhaps, been said to support the position that some of them are popular and primitive in the same sense as *Märchen*. They are composed by peoples of an early stage who find, in a natural improvisation, a natural utterance of modulated and rhythmic speech, the appropriate relief of their emotions, in moments of high-wrought feeling or on solemn occasions. "Poesie" (as Puttenham well says in his *Art of English Poesie*, 1589) “is more ancient than the artificial of the Greeks and Latines, and used of the savage and uncivil, who were before all science and civility. This is proved by certificate of merchants and travellers, who by late navigations have surveyed the whole world, and discovered large countries, and wild people strange and savage, affirming that the American, the Perusine, and the very Canniball do sing and also say their highest and holiest matters in certain riming verses.” In the same way Aristotle, discoursing of the origin of poetry, says (Poet. c. iv.), *ἐγκόρυσσα τὴν ποιήσιν ἐκ τῶν αὐτοχθόνων μών.* M. de Villemarqué in Brittany, M. Pitre in Italy, Herr Urich in Greece, have described the process of improvisation, how it grows out of the custom of dancing in large bands and accompanying the figure of the dance with song. “If the people,” says M. Pitre, “find out who is the composer of a cansone, they will not sing it.” Now in those lands where a blithe peasant life still exists with its dances, like the *kales* of Russia, we find ballads identical in many respects with those which have died out of oral tradition in these islands. It is natural to conclude that originally some of the British ballads too were first improvised, and circulated in rustic dances. We learn from M. Bujeaud and M. de Puymaire in France, that all ballads there have their air or tune, and that every dance has its own words, for if a new dance comes in, perhaps a fashionable one from Paris, words are fitted to it. Is there any trace of such an operatic, lyrical, dancing peasantry in austere Scotland? We find it in Gavin Douglas’s account of—

“Sad as we clepe wenchens and damosells,
In gersy greens, wandering by spring wells,
Of bloomie branches, and flowres white and red,
Plottand their lusty chaplets for their head,
Some sang ring-sangs, dances, lades, and rounds.”

Now, ring-sangs are ballads, dancing songs; and *Young Tamlane*, for instance, was doubtless once danced to, as we know it possessed an appropriate air. Again, Fabyan, the chronicler (quoted by Ritson) says that the song of triumph over Edward II., “was after many days sung in dances, to the carols of the
maidens and minstrels of Scotland.” We might quote the *Complaynt of Scotland* to the same effect. “The shepherds, and their wyvis sang many other melodii songs, . . . than after this sweet celestial harmony, tha began to dance in ane ring.” It is natural to conjecture that, if we find identical ballads in Scotland, and in Greece and Italy, and traces of identical customs—customs crushed by the Reformation, by Puritanism, by modern so-called civilization,—the ballads sprang out of the institution of dances, as they still do in warmer and pleasanter climates. It may be supposed that legends on which the ballads are composed, being found as they are from the White Sea to Cape Matapan, are part of the stock of primitive folk-lore. Thus we have an immemorial antiquity for the legends, and for the lyrical choruses in which their musical rendering was improvised. We are still at a loss to discover the possibly mythological germ of the legends; but, at all events, some ballads may be claimed as distinctly popular, and, so to speak, impersonal in matter and origin. It would be easy to show that survivals out of this stage of inartistic lyric poetry linger in the early epic poetry of Homer and in the French épopées, and that the Greek drama sprang from the sacred choruses of village in-tegers. In the great early epics, as in popular ballads, there is the same directness and simplicity, the same use of recurring epithets, the “green grass the ‘salt sea,” the “shadowy hills,” the same use of simple words, or even nothing of it, the same profusion in the use of gold and silver. But these resemblances must not lead us into the mistake of supposing Homer to be a collection of ballads, or that he can be properly translated into ballad metre. The *Iliad* and the *Odyssey* are the highest form of an artistic epic, not composed by piecing together ballads, but developed by a long series of noble *dadoï*, for the benefit of the great houses which entertain them, out of the method and materials of popular song.

We have here spoken mainly of romantic ballads, which retain in the refrain a vestige of the custom of singing and dancing; of a period when “dance, song and poetry itself began with a communal consent” (Gummere, *The Beginnings of Poetry*, p. 93, 1901). The custom by which a singer in a dancing-circle chants a few words, the dancers chiming in with the refrain, is found by M. Junod among the tribes of Delagoa Bay (Junod, *Chantes et contes des Ba Ronga*, 1897). Other instances are the Australian song-dances (Siebert, in Howitt’s *Native Tribes of South-East Australia*, Appendix 1904; and Dennett, *Folk-Lore of the Fijians*). We must not infer that even among the aborigines of Australia the communal song is entirely “communal.” For they are inspired, they say, in dreams, or by the All Father, devise new forms of song with dance, which are carried all over the country; and Mr Howitt gives a few examples of individual lyric. The history of the much exaggerated opinion that a whole people, as a people, composed its own ballads is traced by Prof. Gummere in *The Beginnings of Poetry*, pp. 116-163. Some British ballads retain traces of the early dance-song, and most are so far “communal” in that, as they stand, they have been modified and interpolated by many reciters in various ages, and finally (in *The Border Minstrelsy*) by Sir Walter Scott, and by hands much weaker than his (see *The Young Tamlame*). There are cases in which the matter of a ballad has been derived by a popular singer from medieval literary romance (as in the Arthurian ballads), while the author of the romance again usually borrowed, like Homer in the *Odyssey*, from popular *Märchen* of dateless antiquity. It would be an error to suppose that most romantic folk-songs are vulgarizations of literary romance—a view to which Mr Courthouse, in his *History of English Poetry*, and Mr Henderson, in *The Border Minstrelsy* (1902), inclined; and the opposite would be to hold that this process of borrowing from and vulgarization of literary medieval romance never occurred. A good illustration of the true state of the case will be found in Child’s introduction to the ballad of *Young Beichan*.

Gaston Paris, a great authority, holds that early popular poetry is “improvised and contemporary with its facts” (*Histoire poétique de Charlemagne*). If this dictum be applied to such ballads as “The Bonnie Earl o’ Murray,” “Kilmont Willie,” “Jamie Telfer,” “Jock o’ the Side,” it must appear that the contemporary poets often knew little of the events and knew that little wrong. We gather the true facts from contemporary letters and despatches. In the ballads the facts are confused and distorted to such a degree that we must suppose them to have been composed in a later generation on the basis of erroneous oral tradition; or, as in the case of *The Queen’s Marie*, to have been later defaced by the fantastic interpolations of reciters. To prove this it is only necessary to compare the historical Border ballads (especially those of 1565-1600) with Bain’s *Border Papers* (1804-1806). Even down to 1750, the ballads on Rob Roy’s sons are more or less mythopoeic. It seems probable that the existing form of most of our border ballads is not earlier than the generation of 1603-1633, after the union of the crowns. Even when the ballads have been taken from recitation, the reciter has sometimes been inspired by a “stall copy,” or printed broadsheet.

**Authorities.**—The indispensable book for the student of ballads is Child’s *English and Scottish Popular Ballads*, published in 1887-1898 (Boston, U. S. A.). Professor Child unfortunately died without finishing up his ideals in a separate essay, and they must be sought in his introductions, which have never been analysed. He did not give much attention to such materials for the study of ancient poetry as exist copiously in anthropological treatises. In knowledge of the ballads the bibliographical treatment of Gummere, *The Bibliography of Ballad Collections*. The bibliography of ballads contains some four hundred titles, (Child, vol. v., pp. 455-468). The most copious ballad makers have been the Scots and English, the German, Slavic, Danish, French and Italian people for the Gothic times but one of the most important islay’s *Lea no pariem* (London, 1872). The general bibliography occupies over sixty pages, and to this the reader must be referred, while Prof. Gummere’s book, *The Beginnings of Poetry*, is a unique introduction to the literature, mainly continental, of the ballad question, which has received but scanty attention in England. For the relation of ballad to epic there is no better guide than Comparetti’s *The Kaiewala*, of which an English translation (1887) was of the purposes the best collection of ballads is Scott’s *Border Minstrels* in its edition. The best critical modern edition is that of Mr T. F. Henderson; his theory of ballad origins is not that which may be gathered from Professor Child’s introductions. (A. L.)

**BALLANCE, JOHN** (1835-1863), New Zealand statesman, eldest son of Samuel Ballance, farmer, of Glenavy, Antrim, Ulster, was born on the 27th of March 1835. He was educated at a national school, and, on leaving, was apprenticed to an ironmonger at Belfast. He became a clerk in a wholesale ironmonger’s house in Birmingham, and migrated to New Zealand, intending to start in business there as a small jeweller. After settling at Wanganui, however, he took an opportunity, keenly observed, of founding, with several others, the *Wanganui Times*, of which he became editor and remained chief owner for the rest of his life. During the fighting with the Maori chief Tikoewari, in 1867, Ballance was concerned in the raising of a troop of volunteer horse, in which he received a commission. Of this he was deprived owing to the appearance in his newspaper of articles criticizing the management of the campaign. He had, however, behaved well in the field, and, in spite of his dismissal, was awarded the New Zealand war medal. He entered the colony’s parliament in 1875 and, with one interval (1881-1884), sat there till his death. Ballance was a member of three ministries, that of Sir George Grey (1877-1879); that of Sir Robert Stout (1884-1887); and that of which he himself was premier (1861-1863). His alliance with Grey ended with a notorious and very painful quarrel. In the Stout government his portfolios were those of lands and native affairs; but it was at the treasury that his prudent and successful finance made the chief mark. As native minister his policy was pacific and humane, and in his last years he contrived to adjust equitably certain long-standing difficulties relating to reserved lands on the west coast of the North Island. He applied to the considerable resources of the colony for the public cash, and advocated with effect their disposal by perpetual lease. His system of state-aided “village settlements,” by which small farms were allotted to peasants holding by lease from the crown, and money lent them to make a beginning of building and cultivation, has been on the whole successful. To Ballance, also, was due the law reducing the life-tenure of legislative councillors
to one of seven years. He was actively concerned in the advocacy of woman suffrage. But his best known achievement was the imposition, in 1861, of the progressive land-tax and progressive income-tax still levied in the colony. As premier he brought together the strong elements of the Liberal and National party which he had held office in New Zealand. In office he showed debating power, constructive skill and tact in managing men; but in 1893, at the height of his success and popularity, he died at Wellington of an intestinal disease after a severe surgical operation.

Quiet and unassuming in manner, Ballance, who was a well-read man, always seemed fonder of his books and his chesboard than of public bustle; yet his loss to New Zealand political life was great. A statue was erected to his memory in front of Parliament House, Wellington.

(W. P. R.)

BALLANCHE, PIERRE SIMON (1776-1847), French philoso-
pher of the theocratic school, was born at Lyons. Naturally
delicate and highly-strung, he was profoundly stirred by the
horrors of the siege of Lyons. His sensitiveness received a
second blow in an unsuccessful love affair, which, however, he
bore with fortitude. He devoted himself to an examination of
the nature of society and his work brought him into connexion
with the literary circle of Châteaubriand and Madame Récamier.
His great work is the Palingénésie, which is divided into three
parts, L'orphée, La formule, La ville des expiations. The first
describes the situation, before the rise of religion; the second
was to be an endeavour to deduce a universal law from known
historical facts; the third to sketch the ultimate state of perfection to which humanity is moving. Of
these the first alone was completed, but fragments of the other
parts exist. Perhaps the most valuable part of the work is the
general introduction. His last work, Vision d'Hébal, intended as
part of the Ville des expiations, describes the chief of a Scottish
clan, who, gifted with second sight, gives semi-prophetic utter-
ances as to the course of world-history. In 1841 Ballanche
was elected a member of the French Academy. He died in 1847.
A collected edition of his works in nine volumes was begun in
1850. Four only appeared. In 1853 a second edition in six
volumes was published. As a man, Ballanche was warm-hearted
and enthusiastic, but he was endowed with a too-vivid imagina-
tion and his strange thoughts are expressed in equally bizarre
language. To give a connected account of his views is difficult;
their full development should be studied in relation with his
life-history, the stages of which are curiously parallel to his
theory of the progress of man, the fall, the trial, the perfection.
This was a consummation of the rationalistic and the theocratic
opposition to the rationalism of the preceding age, emphasized the
principle of authority, placing revelation above individual reason
above freedom and progress. But Ballanche made a sincere
effort to be receptive and in the patriarchal laws of human
language finds a germ of progress. Originally, in the primitive state
of man, speech and thought are identical; but gradually the two
separate; language is no longer only spoken, it is also written and
fixed in writing. The language of the primitive man is spoken;
the original social order which corresponded with it, and was derived
from it, breaks up also. New institutions spring up, upon which thoughts
and in and through which it even draws nearer to a final unity,
the Palingénésie. The volition of primitive man was one with that of
God; but he was found in the patriarchy, and the ineffable
life of man itself is given over to the divine will, and through the oppositions and trials of
this world work onward to a second and a more complete harmony.
Humanity, therefore, passes through three stages, the fall from
perfection, the patriarchal condition, and the birth to final
perfection. In the dim records of mythical times may be traced
the obscure outlines of primitive society and of its fall. Actual
history exhibits the conflict of two great principles, which may be
said to have done the same service as that taken by the Roman plebs in its
attempts to attain equality with the patricians. On the events
through which the human race is to achieve its destiny Ballanche
gives few intelligible hints. The sudden flash which disclosed to the
eyes of Hébal the whole epic of humanity cannot be reproduced in
language transmitted by time and space. Scattered throughout the
works of Ballanche are many valuable ideas on the connexion of
events which makes possible a philosophy of history; but his own
thoughts are so strong and unadulterated with any idea of finding more favour than it has already
received. Besides the Palingénésie, Ballanche wrote a poem on the siege at Lyons (unpublished); Du sentiment considéré dans la
littérature et dans les arts (1801); Antigone, a prose poem (1814);
Histoire de la philosophie de l'humanité; his poems, and even a
descriptions, are a prelude to his great work; Le Vieillard et le jeune homme, a philosophical
dialogue (1819); L'Homme sans nom, a novel (1820).

bibliography); C. Huitt, La Vie et les œuvres de Ballanche (1904).

W. P. R.

BALLANTINE, WILLIAM (1812-1887), English serjeant-at-
law, was born in London on the 3rd of January 1812, being the
son of a London police magistrate. He was educated at St Paul's
school, and called to the bar in 1834. He began in early life a
varied acquaintance with dramatic and literary society, and his
experience, combined with his own pushing character and acute
intellect, helped to obtain for him very soon a large practice,
particularly in criminal cases. He became known as a formidable
cross-examiner, his great rival being Serjeant Parry (1816-1880).
The three great cases of his career were his successful prosecution
of the murderer Franz Müller in 1864, a skilful defence of the
Tichborne claimant in 1867, and his conduct of the
gwark at Baroda in 1875, his fee in this last case being one of
the largest ever known. Ballantine became a serjeant-at-law in
1856. He died at Margate on the 6th of January 1887, having
previously published more than one volume of reminiscences.
Serjeant Ballantine's private life was decidedly Bohemian; and
though he earned large sums, he died very poor.

BALLANTYNE, ROBERT MICHAEL (1825-1894), Scottish
writer of fiction, was born at Edinburgh on the 24th of April 1825,
and came of the same family as the famous printers and publishers.
When sixteen years of age he went to Canada and was for six
years in the service of the Hudson's Bay Company. He returned
to Scotland in 1847, and next year published his first book,
Hudson's Bay: or, Life in the Wilds of North America.
For some time he was employed by Messrs Constable, the publishers,
but in 1856 he gave up business for the profession of literature,
and began the series of excellent stories of adventure for the
young with which his name is popularly associated. The Young
Far-Traders (1856), The Coral Island (1857), The World of Ice
(1859), A Journey to the Centre of the Earth (1870), The Light-ache
(1886), Deep Dames (1872), Erling the Bold (1886), The Settler and the Savage
(1877) and other books, to the number of upwards of a hundred, followed in
regular succession, his rule being in every case to write as far as
possible from personal knowledge of the scenes he described.
His stories had the merit of being thoroughly healthy in tone
and possessed considerable graphic force. Ballantyne was also
a real artist, and exhibited some of his water-colours at the
Royal Scottish Academy. He lived in later years at Harrow,
and died on the 8th of February 1894, at Rome, where he had
gone to attempt to shake off the results of overwork. He wrote
a volume of Personal Reminiscences of Book-making (1853).

BALLARAT [BALLARAT] and BALLARAT EAST, a city and
town of the Melbourne district, Victoria, Australia, 74 m. by rail
W.N.W. of Melbourne. The city and Ballarat East, separated
only by the Yarrowee Creek, are distinct municipalities. Pop.
of Ballarat (1901) 25,448, of Ballarat East, 18,562. Ballarat
is the city and the chief gold-mining centre of the state.
The alluvial gold-fields were the richest ever opened up, but as
these deposits have been exhausted the quartz reefs at deep
levels have been exploited, and several mines are worked a considerable
distance exceeding 2000 ft. The city is the seat of Anglican and Roman
Catholic bishops. It has a number of admirable public buildings,
while, among several parks and recreation grounds, mention
must be made of the fine botanical garden, 750 acres in extent,
where, in Lake Wendouree, pisciculture is carried on with great success. The school of mines is the most important in Australia and is affiliated to the university of Melbourne. Ballarat is an important railway centre and its industries include woolen-milling, brewing, iron-founding, flour-milling and distilling. Owing to its elevation of 1435 ft. it has an exceptionally cool and healthy climate. Although the district is principally devoted to mining it is well adapted for sheep-farming, and some of the finest wool in the world is produced near Ballarat. The existence of the towns is due to the heavy immigration which followed upon the discovery of the gold-fields in 1851. In 1834, in their resistance of an arbitrary tax, the miners came into armed conflict with the authorities; but a commission was appointed to investigate their grievances; and a charter was granted to the town in 1855. In 1870 Ballarat was raised to the rank of a city.

**Ballast (O. Swed. barlast, perhaps from bar, bare or mere, and last, load), heavy material, such as gravel, stone or metal, placed in the hold of a ship in order to immerse her sufficiently to give adequate stability. In botany "ballast-plants" are so-called because they have been introduced into countries in which they are not indigenous through their seeds being carried in such ballast. A ship "in ballast" is one which carries no passengers; the place of ballast is taken by water-tanks which are filled more or less as required to trim the ship. The term is also applied to materials like gravel, broken slag, burnt clay, &c., used to form the bed in which the sleepers or ties of a railway track are laid, and also to the sand which a balloonist takes up with him, in order that, by throwing portions of it out of the car from time to time, he may lighten his balloon when he desires it to rise to a higher level.

**Ballater (Gaelic for "the town on a sloping hill"), a village in the parish of Glenmuick, Aberdeenshire, Scotland, 670 ft. above the sea, on the left bank of the Dee, here crossed by a fine bridge, 434 m. by rail W. by S. of Aberdeen. It is the terminus of the Deeside railway and the station for Balmoral, 9 m. to the W. Founded in 1770 to provide accommodation for the visitors to the mineral wells of Pannanich, 1½ m. to the E., it has since become a popular summer resort. It contains the Albert Memorial Hall and the barracks for the sovereign's bodyguard, used when the king is in residence at Balmoral. Red granite is the chief building material of the houses. Ballatrich farm, where Byron spent part of his boyhood, is 4 m. to the E. Ballater station stands at a mean temperature of 44° 6' F. and an average annual rainfall of 33-4 in.

**Ballenstedt,” a town of Germany, in the duchy of Anhalt, on the river Getel, 20 m. E. of Quedlinburg by rail. Pop. (1900) 5423. It is pleasantly situated under the north-eastern declivity of the Harz mountains. The inhabitants are mostly engaged in agriculture and there is practically no other industry. The palace of the dukes of Anhalt, standing on an eminence, contains a library and collections of various kinds, including a good picture gallery. It is approached by a fine avenue of trees and is surrounded by a well-wooded park. In the Schlosskirche the grave of Albert the Bear, margrave of Brandenburg (1100–1170) has been discovered.

**Ballet,” a performance in which dancing, music and pantomime are involved. Originally derived from the (Sicilian) Gr. ἀλλάζω, to dance, the word has passed through the Med. Lat. bailar (with ballar as synonymous with saltar) to the Ital. ballare and ballo, to the Fr. balé, to the O. Eng. balle, and to ball. In the works of Danceny and Rousseau, ballet signifies "to dance, to sing, to rejoue"; and thus it incorporates three distinct modern words, "ballet, ball and ballad." Through the gradual changes in the amusements of different ages, the meaning of the first two words has at length become limited to dancing, and the third is now confined to singing. But, although ballads are no longer the vocal accompaniments to dances round the maypole, old ballads are still sung to dance tunes. The present acceptation of the word ballet is—a theatrical representation in which a story is told only by gesture, accompanied by music, which should be characterized by stronger emphasis than would be employed with the voice. The dancing should be connected with the story but is more commonly incidental. The French word was found to be so comprehensive as to require further definition, and thus the above-described would be distinguished as the ballet d'action or pantomime ballet, while a single scene, such as that of a village festival with its dances, would now be termed a divertissement.

The ballet d'action, to which the changed meaning of the word is to be ascribed, and therewith the introduction of modern ballet, has been generally attributed to the 17th century. Novelty of entertainment was then sought for in the splendid courts of Italy, in order to celebrate events which were thought great in their time, such as the marriages of princes, or the triumphs of their arms. Invention was on the rack for novelty, and the skill of the machinist was taxed to the utmost. It has been supposed that the art of the old Roman pantomimi was then revived, to add to the attractions of court-dances. Under the Roman empire the pantomimi had represented either a mythological story, or perhaps a scene from a Greek tragedy, by mute gestures, while a chorus, placed in the background, sang cantica to narrate the fable, or to describe the action of the scene. The question is whether mute pantomimic action, which is the essence of modern ballet, was carried through those court entertainments, in which kings, princes and princesses, took parts with the chorus; or whether it is of later growth, and derived from professional dances upon the stage. The former is the general opinion, but the court entertainments of Italy and France were masques or masks which included declamation and song, like those of Ben Jonson with Inigo Jones for the court of James I.

The earliest modern ballet on record was that given by Bergonzi di Bottia at Tortona to celebrate the marriage of the duke of Milan in 1489. The ballet, like other forms of dancing, was developed and perfected in France; it is closely associated with the history of the opera; but in England it came much later than the opera, for it was not introduced until the 18th century, and in the first Italian operas given in London there was no ballet. During the regency of Lord Middlesex a ballet-master was appointed and a corps of dancers formed. The ballet has had three distinct stages in its development. For a long time there was to be found only at the court, when princely entertainments were given to celebrate great occasions. At that time ladies of the highest rank performed in the ballet and spent much time in practicing and perfecting their parts. For their parts and the cost they were well paid. In 1756 Cosimo D'Este introduced these entertainments into France and spent large sums of money on devising performances to distract her son's attention from the affairs of the state. Baltasarini, otherwise known as Beaujoyeux, was the composer of a famous entertainment given by Catherine in 1581 called the "Ballet Comique de la Reyne." This marks an era in the history of the opera and ballet, for we find here for the first time dance and music arranged for the display of coherent dramatic ideas. Henry IV., Louis XIII. and XIV. were all lovers of the ballet and performed various characters in them, and Richelieu used the ballet as an instrument for the expression of political purposes. Lully was the first to make an art of the composition of ballet music and he was the first to insist on the admission of women as ballet dancers, feminine characters having hitherto been assumed by men dressed as women. When Louis XIV. became too fat to dance, the ballet at court became unpopular and thus was ended the first stage of its development. It was then adopted in the colleges at prize distributions and other occasions, when the pupils of lully and Quinault were commonly performed. The third period in the history of the ballet was marked by its appearance on the stage, where it has remained ever since. It should be added that up till the third period dramatic poems had accompanied the ballet and the dramatic meaning was helped out with speech and song; but with the advent of the third period speech disappeared and the purely pantomime performance, or ballet d'action, was instituted.

The father of ballet dancing as we know it at the present day was Jean Georges Noverre (q.v.). The ballet d'action was really invented by him; in fact, the ballet has never advanced beyond the stage to which he brought it; it has rather gone back. The
essence of Noverre’s theory was that mere display was not enough to ensure interest and life for the ballet; and some years ago Sir Augustus Harris expressed a similar opinion when he declared that ballet was one of the decadence of the modern ballet. Noverre brought to a high degree of perfection the art of presenting a story by means of pantomime, and he never allowed dancing which was not the direct expression of a particular attitude of mind. Apart from Noverre, the greatest ballet-master was undoubtedly Gaetano Apolline Balthazare Vestris (q.v.), who modestly called himself le dieu de la danse, and was, indeed, the finest male dancer that Europe ever produced. Gluck composed Iphigénie en Aulide in conjunction with Vestris. In 1750 the two greatest dancers of the day performed together in Paris in a ballet-opera called L’Amour et Héro; the dancers were Vestris and Madame Camargo (q.v.), who introduced short skirts in the ballet.

The word “ballet” was first used in the English language by Dryden in 1667, and the first descriptive ballet seen in London was The Tavern Bilkers, which was played at Drury Lane in 1702. Since then the ballet in England has been purely exotic and has merely followed on the lines of French developments.

The palmy days of the ballet in England were in the first half of the 19th century, when a royal revenue was spent on the maintenance of this fashionable attraction. Some famous dancers of this period were Carlotta Grisi, Mlle Taglioni (who is said to have turned the heads of an entire generation), Fanny Elsler, Mlle Cori, Miss P. Hony, Miss Lucile Grahn, and Mlle Carolina Rosati. In later years Kate Vaughan was a remarkably graceful dancer of a new type in England, and, in Sir Augustus Harris’s opinion, she did much to elevate the modern art. She was the first to make skirt-dancing popular, although that achievement will not be regarded as an unmixed benefit by every student of the art. Skirt-dancing, in itself a beautiful exhibition, is a departure from true dancing in the sense that the steps are of little importance in it; and we have seen its development extend to a mere exhibition of whirling draperies under many-coloured lime-lights. The best known of Miss Vaughan’s disciples and imitators (each of whom has contributed something to the art on her own account) were Miss Sylvia Grey and Miss Letty Lind. Of the older and classical school of ballet-dancing Adeline Genée became in London the finest exponent. But ballet-dancing, affected by a tendency in modern entertainment to make less and less demands on the intelligence and intellectual appreciation of the public, and more and more demands on the eye—i.e., the sense most easily affected—has gradually developed into a spectacle, the chief interest of which is quite independent of dancing. Thousands of pounds are spent on dressing a small number of women, who do little but march about in the same costume and group themselves in accordance with some design of colour and mass; and no more is asked of the intelligence than to believe that a ballet dressed, for example, in military uniform is a compliment to or glorification of the army. Only a few out of hundreds of members of the corps de ballet are really dancers and they perform against a background of colour afforded by the majority. It seems unlikely that we shall see any revival of the best period and styles of dancing until a higher standard of grace and manners becomes fashionable in society. With the constantly increasing abolition of ceremony, courtliness of manner is bound to diminish; and in an atmosphere of ceremony, courtesy and chivalry can the dance maintain itself in perfection.

Literature.—One of the most complete books on the ballet by the Jesuit, Claude François Menestrier, Des ballets anciens et modernes, was published in 1712. He was a pupil of Mme de Louis XIV. In 1658; and in his book he analyses about fifty of the early Italian and French ballets. See also Noverre, Lettres sur la danse (1760; new ed. 1804); Castel-Blaze, La Danse et les ballets (1832), and Les Origines de l’opéra (1869).

BALL-FLOWER, an architectural ornament in the form of a ball inserted in the cup of a flower, which came into use in the latter part of the 13th and was in great vogue in the early part of the 14th century. It is generally placed in rows at equal distances in the hollow of a moulding, frequently by the sides of mullions. The earliest known is said to be in the west part of Salisbury cathedral, where it is mixed with the tooth ornament. It seems to have been used more and more frequently, till at Gloucester cathedral, in the south side, it is in profusion.

BALLINA, a town and district of British India, in the Benares division of the U. P. provinces. The town is situated on the left bank of the Ganges, below the confluence of the lesser Ganges. It is really an aggregation of rural villages. Pop. (1901) 15,278.

The district of Ballina, constituted in 1870, occupies an angle at the junction of the Gogra with the Ganges, being bordered by two districts of Behar. It contains an area of 1,245 sq. m. Owing to the great pressure on the soil from the density of the population, to the reluctance to part with land characteristic of small proprietors, to the generally great productiveness of land and to the very light assessment of government revenue, land in Ballina, for agricultural purposes merely, has a market value higher than in almost any other district. It commonly brings in Rs. 200 per bigha, or 50 per acre, and sometimes double that figure. In 1901 the population was 98,768, showing a decrease of 5% in the decade. The principal crops are rice, barley, other food-grains, pulse, sugar-cane and opium. There are practically no manufactures, except that of sugar. Trade is carried on largely by way of the two bordering rivers.

Ballina, a seaport and market-town of county Mayo, Ireland, in the north parliamentary division, on the left bank of the river Moy, with a station on the Killala branch of the Midland Great Western railway. Pop. of urban district (1901) 4,905. Across the river, and therefore in county Sligo, is the suburban of Ardmore, connected with Ballina by two bridges. In Ardmore is the Roman Catholic cathedral (diocese of Killala), with an east window of Munich glass, and the ruins of an Augustinian abbey (1427) adjoining. There is a Roman Catholic diocesan college and the Protestant parish church is also in Ardmore. A convent was erected in 1867. In trade and population Ballina is the first town in the county. The salmon-fishing and fish-curing are important branches of its trade; and it has also breweries and flour-mills and manufactures snuff and coarse linen. On the 25th of August 1798, Ballina was entered by the French under General Humbert, marching from their landing-place at Killala. In the neighbourhood there is the interesting cromlech of the four Maels, which, if actually erected over the criminals whose name it bears, is proved by the early annals of Ireland to belong to the 7th century A.D. Their story relates that these men, foster-brothers of Cellach, bishop of Kilmore-Moy, murdered him at the instigation of Guaire Ailmhe, king of Connaught, but were themselves executed at Ardane (Ar-d-na-ragadh, the hill of the executions) by the bishop's brother. The Moy is a notable salmon river for rod-fishing and its tributaries and the neighbouring lakes contain trout.

BALLINASLOE, a market town of county Galway, Ireland, in the east parliamentary division, 91 m. W. of Dublin, on the Midland Great Western main line. Pop. of urban district (1901) 4,904. The river Suck, an affluent of the Shannon, divides it into two parts, of which the eastern was in county Roscommon until 1898. The town contains remains of a castle of Elizabethan date. Industries include brewing, flour-milling, tanning, hat-making and carriage-building. Trade is assisted by water-communication through the Grand canal to the Shannon. The town is widely celebrated for its great annual cattle-fair held in October, at which vast numbers of cattle and sheep are offered for sale. Adjoining the town is Garbally Castle, the seat of the earl of Clancarty, into the demesne of which the great fair extends from the town.

BALLISTICS (from the Gr. βάλλειν, to throw), the science of throwing warlike missiles or projectiles. It is now divided into two parts: Exterior Ballistics, in which the motion of the projectile is considered after it has received its initial impulse; when the projectile is moving freely under the influence of gravity and the resistance of the air, and it is required to determine the circumstances so as to hit a certain object, with a view to its destruction or perforation; and Interior Ballistics, in which the pressure of the powder-gas is analysed in the bore
of the gun, and the investigation is carried out of the requisite charge of powder to secure the initial velocity of the projectile, without straining the gun unduly. The powder pressure is dealt with in the article ORDNANCE.

I. EXTERIOR BALLISTICS.

In the ancient theory due to Galileo, the resistance of the air is ignored, and, as shown in the article on MECHANICS (§ 13), the trajectory is now a parabola. But this theory is very far from being of practical value for most purposes of gunnery. In the first place, a most important requirement is an accurate experimental knowledge of the resistance of the air to the projectiles employed, at all velocities useful in artillery. The theoretical assumptions of Newton and Euler (hypoteseis magis mathematicae quam naturales) of a resistance varying as some simple power of the velocity, for instance, as the square or cube of the velocity (the quadratic or cubic law), lead to results of great analytical complexity, and are useful only for provisional extrapolation at high or low velocity, pending further experiment.

The foundation of our knowledge of the resistance of the air, as employed in the construction of ballistic tables, is the series of experiments carried out between 1864 and 1886 by the Rev. F. Bashforth, B.D. (Report on the Experiments made with the Bashforth Chronograph, &c., 1865-1870; Final Report, &c., 1878-1880; The Bashforth Chronograph, Cambridge, 1890). According to these experiments, the resistance of the air can be represented by no simple algebraical law over a large range of velocity. bashforth therefore assumed a more general form for the resistance, and the variable term of the form

\[ R = nd^p \]

where \( d \) is the diameter of the projectile, and \( n \) and \( p \) are constants. This is due to the work of Sir George Airy, and is known as the Airy law of resistance.

Collecting all the coefficients, \( t, k, k', k'' \), into one, we put

\[ R = nd^p + ndf(v) \]

where

\[ n = k + t, \]

and \( n \) is called the coefficient of resistance.

By means of a well-chosen value of \( n \), determined by a few experiments, it is possible to carry out further experiment, with the most recent design, to utilize Bashforth's experimental results carried out with old-fashioned projectiles fired from muzzle-loading guns. For instance, \( n = 0.8 \) or even less is considered a good average for the muzzle bullet.

Starting with the experimental values of \( p \), for a standard projectile, fired under standard conditions in air of standard density, we proceed to the construction of the ballistic table. We first determine the time \( t \) in seconds required for the velocity of a shot, fired in diameter and weighing \( w \) lb, to fall from any initial velocity \( V(t) \) to any final velocity \( v(t) \). The shot is supposed to move horizontally, and the curve of effect of gravity is ignored.

If \( dv \) seconds is the time during which the resistance of the air, \( R \) lb, causes the velocity of the shot to fall \( dv(t) \), so that the velocity drops from \( v + \frac{1}{2}dv \) to \( v - \frac{1}{2}dv \) in passing through the mean velocity \( v \), then

\[ Rdv = -\frac{1}{2}dv(t) \]

so that with the value of \( R \) in (1),

\[ \Delta t = \frac{dv(v)}{w} \]

and \( C \) the ballistic coefficient (driving power) of the shot, so that

\[ \Delta t = \frac{dv}{w} \]

and \( T \) is the time in seconds for the velocity to drop \( dv \) of the standard shot for which \( C \) = 1, and for which the ballistic table is calculated.

Since \( p \) is determined experimentally and tabulated as a function \( V \) of \( V \), the velocity of a shot is the argument of the ballistic table; and taking \( dv = 10 \), the average value of \( p \) in the interval is used to determine \( \Delta t \).

Denoting the value of \( T \) at any velocity \( V \) by \( T(\sigma) \), then

\[ T(\sigma) = \sum_{1}^{\sigma} dv(v) + \int_{1}^{\sigma} dv(v) \]

and the integration is performed in the table for each velocity and the average of \( dv(v) \) for any velocity in the interval is used to determine \( \Delta t \).

The constant may be any arbitrary number, as in using the table the error in range only is of the second tabular value for an average of the velocity \( V \) and final velocity \( v \), and thus

\[ T(V) - T(\sigma) = \sum_{1}^{\sigma} dv(v) + \int_{1}^{\sigma} dv(v) \]

and for a shot whose ballistic coefficient is \( C \)

\[ t = \frac{T(V) - T(\sigma)}{C} \]

The difference of proportional parts the value of \( T(\sigma) \) for unit increment of \( \sigma \) is interpolated in a full-length extended ballistic table for \( T \).

Next, if the shot advances a distance \( \Delta s \) ft. in the time \( \Delta t \), during which the velocity falls from \( v + \frac{1}{2}dv \) to \( v - \frac{1}{2}dv \), we have

\[ Rdv = -\frac{1}{2}dv(t) \]

or

\[ \Delta s = \frac{dv(v)}{w} \]

and \( \Delta s \) is the distance in feet of a shot for which \( C = 1 \), while the velocity falls \( dv \) in passing through the average velocity \( v \).

Denoting by \( S(t) \) the sum of all the values of \( \Delta s \) up to any assigned velocity \( v \),

\[ S(t) = \sum_{1}^{\sigma} dv(v) + \int_{1}^{\sigma} dv(v) \]

and \( S(t) \) is the distance in feet of a shot whose ballistic coefficient is \( C \),

\[ s = C(S(V) - S(\sigma)) \]

In an extended table of \( S \), the value is interpolated for unit increment of range. A third table, due to Sir W.D. Niven, F.R.S., called the degree table, determines the change of direction of motion of the shot while the velocity changes from \( V \) to \( v \), the shot flying nearly horizontally.

To explain the theory of this table, suppose the tangent at the point of the trajectory, where the velocity is \( v \), to make an angle \( \theta \) from the horizontal.

Resolving normally in the trajectory, and supposing the resistance of the air to act tangentially,

\[ v = \frac{\sin \theta}{\cos \theta} \]

where \( di \) denotes the instantaneous decrement of \( i \) in the infinitesimal increment of time \( dt \).

small as in direct fire.
The last function A, called the altitude function, will be explained
when high angle fire is considered.
These functions, T, S, D, 1, A, are shown numerically in the following extract from an abridged ballistic table, in which the velocity
is taken as the argument and proceeds by an increment of 10 f/s;
the column for p is the one determined by experiment, and the
remaining columns follow by calculation in the manner explained
above. The initial values of T, S, D, I, A must be accepted as
belonging to the anterior portion of the table.
In any region of velocity where it is possible to represent p with
sufficient accuracy by an empirical formula composed of a single
power of v, say if*, the integration can be effected which replaces
the summation in (10), (16), and (24); and from an analysis of the
Krupp experiments Colonel Zabudski found the most appropriate
index
in a region of velocity as given in the following table, and
the corresponding value of gp, denoted by/ (t>)or V/k or its equivalent
O, where r is the retardation. "

The numbers have been changed from kilogramme-metre to pound-foot units by Colonel Ingalls, and employed by him in the calculation of an extended ballistic table, which can be compared with the result of the abridged table. The calculation can be carried out in each region of velocity from the formulae:

\[ T(V) - T(v) = k \int v^{-n} dv, \quad S(V) - S(v) = k \int v^{n} dv \]

and the corresponding integration.

The following exercises will show the application of the ballistic table. A slide rule should be used for the arithmetical operations, as it works to the accuracy obtainable in practice.

Example 1.—Determine the time \( t \) sec. and distance \( s \) ft. in which the velocity falls from 2150 to 1600 ft/s.

(a) of a 6-in. shell weighing 100 lb, taking \( n = 0.96 \),

(b) of a rifle bullet, 0.303-in. calibre, weighing half an ounce, taking \( n = 0.8 \).

\[
\begin{array}{|c|c|c|c|c|c|c|}
\hline
\hline
2150 & & 1600 & & & & & \\
2574.95 & 2893 & 2574.95 & 2893 & 0.154 & 2115.35 & 1853.35 & 1114.35 \\
\hline
\end{array}
\]

Example 2.—Determine the remaining velocity \( v \) and time of flight \( t \) over a range of 1000 yds. of the same two shot, fired with the same muzzle velocity \( V = 2150 \) ft/s.

\[
\begin{array}{|c|c|c|c|c|c|c|}
\hline
\hline
3000 & & 1037 & & 2893 & & 0.154 \\
3000 & & 7900 & & 2893 & & 0.154 \\
\hline
\end{array}
\]

In the calculation of range tables for direct fire, defined officially as fire from guns with full charge at elevation not exceeding \( 15^\circ \), the vertical component of the resistance of the air may be ignored as insensible, and the actual velocity and its horizontal component, or component parallel to the line of sight, are undistinguishable.

The equations of motion are now, the co-ordinates \( x \) and \( y \) being measured in feet,

\[ \frac{d^2x}{dt^2} = -eg \]

\[ \frac{d^2y}{dt^2} = -g. \]

* These numbers are taken from a part omitted here of the abridged ballistic table.

**Balling**

The first equation leads, as before, to

\[ t = C[T(V) - T(v)], \]

\[ x = C[S(V) - S(v)]. \]

The integration of (24) gives

\[ \frac{dy}{dt} = \text{constant} - gt = g(T(v) - t), \]

if \( t \) denotes the whole time of flight from \( O \) to the point \( B \) (fig. 1), where the trajectory cuts the line of sight; so that \( \frac{dy}{dt} \) is the time to the vertex \( A \), where the shot is flying parallel to \( OB \).

Integrating (27) again,

\[ \frac{y}{y'} = g(T(v) - t), \]

and denoting \( T(v) - t \) by \( \delta \), and taking \( g = 32 \) ft/sec\(^2\),

\[ y = \delta T(v). \]

which is Colonel Sladen's formula, employed in plotting ordinates of a trajectory.

At the vertex \( A \), where \( y = H \), we have \( t = \delta = T(v) \), so that

\[ H = \delta T(v). \]

for practical purposes, taking \( g = 32 \) ft/sec\(^2\), is replaced by

\[ H = \frac{4\delta}{3} T(v). \]

Thus, if the time of flight of a shell is \( \delta \) sec., the height of the vertex of the trajectory is about \( 100 \) ft.; and if the fuse is set to burst the shell one-tenth of a second short of its impact at \( B \), the height of the burst is \( \frac{1}{8} \delta \), say \( 8 \) ft.

The line of sight \( Ox \), considered horizontal in range table results, may be inclined slightly to the horizon, as in shooting up or down a moderate slope, without appreciable modification of (28) and (29), and \( y \) or \( PM \) is still drawn vertically to meet \( OB \) in \( M \).

The initial velocity \( V \), and a range of \( R \) yds., or \( X = 3R \) ft., the final velocity \( v \) is first calculated from (29) by

\[ S(v) = S(V) - X/C, \]

and then the time of flight \( T(v) \) by

\[ T(v) = C(T(V) - T(v)). \]

Denoting the angle of departure and descent, measured in degrees and from the line of sight \( OB \) by \( \phi \) and \( \beta \), the total deviation in the range \( OB \) is (fig. 1)

\[ \beta + \phi = C[D(V) - D(v)]. \]

To share the \( \delta \) between \( \phi \) and \( \beta \), the vertex \( A \) is taken as the point of half-time (and therefore beyond half-range, because of the continual diminution of the velocity), and the velocity \( v \) at \( A \) is calculated from the formula

\[ T(v) = T(V) - \frac{AT}{C} = \frac{1}{2} (T(V) + T(v)); \]

and now the degree table for \( D(v) \) gives

\[ \phi = C[D(V) - D(v)], \]

and \( \beta = C[D(v) - D(v)]. \]

This value of \( \phi \) is the tangent elevation (T.E.); the quadrant elevation (Q.E.) is \( \phi - S \), where \( S \) is the angular depression of the line of sight \( OB \); and if \( O \) is \( h \) ft. vertical above \( B \), the angle \( S \) at a range of \( R \) yds. is given by

\[ \sin S = h/3R, \]

or, for a small angle, expressed in minutes, taking the radian as \( \frac{3438}{2}: \)

\[ S = 114.6h/R. \]

So also the angle \( \beta \) must be increased by \( S \) to obtain the angle at which the shot strikes a horizontal plane— the water, for instance.

A systematic exercise is given here of the compilation of a range table by calculation with the ballistic table, and it is to be compared with the published official range table which follows.

A discrepancy between a calculated and tabulated result will serve to show the influence of a slight change in the coefficient of reduction \( n \), and the muzzle velocity \( V \).

Example 3.—Determine by calculation with the abridged ballistic table the remaining velocity \( v \), the time of flight \( t \), angle of elevation \( \phi \), and descent \( \beta \), of this 6-in. gun at ranges 500, 1000, 1500, 2000 yds., taking the muzzle velocity \( V = 2150 \) ft/s, and a coefficient of reduction \( n = 0.96 \). [For Table see p. 274.]

An important problem is to determine the alteration of elevation for firing up and down a slope. It is found that the alteration of the tangent elevation is almost insensible, but the quadrant elevation requires the addition or subtraction of the angle of sight.

Example.—Find the alteration of elevation required at a range of 3000 yds. in the exchange of fire between a ship and a fort 1200 ft. high, a 12-in. gun being employed on each side, firing a shot weighing 850 lb with velocity 2150 ft/s. The complete ballistic table, and the method of high angle fire (see below) must be employed.
The last column in the Range Table giving the inches of penetration into wrought iron is calculated from the remaining velocity by an empirical formula, as explained in the article ARMOUR PLATES.

*High Angle and Curved Fire.*—"High angle fire," as defined officially, is fire at elevations greater than 15°," and "curved fire from howitzers at all angles of elevation not exceeding 15°." In these cases the curvature of the trajectory becomes considerable, and the formule employed in direct fire must be modified; the method generally employed is due to Colonel Siacci of the Italian artillery.

Starting with the exact equations of motion in a resisting medium,

\( \frac{dx}{dt} = r \cos i = -r \frac{dx}{dt} \)

\( \frac{dy}{dt} = r \sin i - g \frac{dy}{dt} - g \)

and eliminating \( r \),

\( \frac{dx}{dt} \frac{dy}{dt} - \frac{dy}{dt} \frac{dx}{dt} = \frac{dx}{dt} \frac{dx}{dt} \)

and this, in conjunction with

\( \tan i = \frac{dy}{dx} \)

\( \sec^2 \frac{dt}{di} = \left( \frac{dx}{dy} \frac{dy}{dx} \right) \frac{dx}{dt} \frac{dx}{dt} \)

reduces to

\( \frac{dt}{di} = -\frac{v \cos i}{g}, \)  

or \( \frac{dt}{di} = -\frac{g}{v \cos i} \),

the equation obtained, as in (18), by resolving normally in the trajectory, but \( dt \) now denoting the increment of \( t \) in the increment of time \( di \).

Denoting \( dx/dt \), the horizontal component of the velocity, by \( q \), so that

\( v \cos i = q \),

equation (43) becomes

\( dq = -r \cos i \),

and therefore by (48)

\( dq = dq/di \).

It is convenient to express \( r \) as a function of \( v \) in the previous notation

\( r = f(v) \).

and now

\[ dq = q \sqrt{\frac{o}{f(v)}} \]

an equation connecting \( q \) and \( v \).

Now, since \( v = q \sec i \)

\[ \frac{df}{q} = Cg \]

and multiplying by \( dx/dt \) or \( q \),

\[ \frac{dx}{dt} = Cg \frac{d(q \sec i)}{q} \]

and multiplying by \( dy/dx \) or \( \tan i \),

\[ \frac{dy}{dx} = Cg \frac{d(q \sec i \tan i)}{q} \]

also

\[ \frac{d}{q} \frac{d(q \sec i \tan i)}{q} \]

from which the values of \( i, x, y, t \), and \( tan i \) are given by integration with respect to \( q \), when \( sec i \) is given as a function of \( q \) by means of (51).

Now these integrations are quite intractable, even for a very simple mathematical assumption of the function \( f(v) \), say the quadratic or cubic law, \( f(v) = v^2 \) or \( v^3 \).

But, as originally pointed out by Euler, the difficulty can be turned if we notice that in the ordinary trajectory of practice the quantities \( i, x, y, t \), and \( tan i \) vary so slowly that they may be replaced by their mean values, \( v \), \( \cos i \), and \( sec i \), especially if the trajectory, when considerable, is divided up in the calculation into arcs of small curvature, the curvature of an arc being defined as the angle between the tangents or normals at the ends of the arc.

Replacing then the angle \( i \) on the right-hand side of equations (54)–(56) by some mean value \( \eta \), we introduce Siacci's pseudovelocity \( u \) defined by

\[ u = q \sec \eta \]

so that \( u \) is a quasi-component parallel to the mean direction of the tangent, say the direction of the chord of the arc.
Integrating from any initial pseudo-velocity $U$,

$$ t = \int_0^U \frac{du}{u} $$

$$ z = x \cos \phi \int_0^u \frac{du}{u} $$

$$ y = x \sin \phi \int_0^u \frac{du}{u} $$

and supposing the inclination $i$ to change from $\phi$ to $\theta$ radians over the arc,

$$ \phi - \theta = C \cos \phi \int_0^u \frac{du}{u} $$

$$ \tan \phi - \tan \theta = C \sec \phi \int_0^u \frac{du}{u} $$

But according to the definition of the functions $T$, $S$, $I$ and $D$ of the ballistic table, employed for direct fire, with $u$ written for $v$,

$$ \int \frac{du}{u} = \int \frac{du}{g} + T(U) - T(u), $$

$$ \int \frac{du}{S} = S(U) - S(u), $$

$$ \int \frac{du}{I} = I(U) - I(u), $$

and therefore

$$ t = C[T(U) - T(u)], $$

$$ x = x \cos \phi [S(U) - S(u)], $$

$$ y = x \sin \phi [S(U) - S(u)], $$

$$ \phi - \theta = C \cos \phi [I(U) - I(u)], $$

$$ \tan \phi - \tan \theta = C \sec \phi [I(U) - I(u)], $$

while, expressed in degrees,

$$ \phi' - \theta' = C \cos \phi [D(U) - D(u)]. $$

The equations (66)-(71) are Siacci's, slightly modified by General Mayevski; and now in the numerical applications to high angle fire we can still employ the ballistic table for direct fire.

It will be noticed that $\eta$ cannot be exactly the same mean angle in all these equations; but if $\eta$ is the same in (66) and (70),

$$ y/x = \tan \eta, $$

so that $\eta$ is the inclination of the chord of the arc of the trajectory, as in Niven's method of calculating trajectories (Proc. R. S., 1877); but this method requires $\eta$ to be known with accuracy, as $\pm \% \, \text{var}$ in $\eta$ causes more than $1 \% \, \text{var}$ in $\tan \eta$.

The difficulty is avoided by the use of Siacci's altitude-function $A$ or $A(u)$, by which $y/x$ can be calculated without introducing $\sin \eta$ or $\tan \eta$, but in which $\eta$ occurs only in the form $\cos \eta$ or $\sec \eta$, which varies very slowly for moderate values of $\eta$, so that $\eta$ need not be calculated with any great regard for accuracy, the arithmetic mean $\frac{1}{2}(\phi + \theta)$ of $\phi$ and $\theta$ being near enough for $\eta$ over any arc $\phi - \theta$ of moderate extent.

Now taking equation (72), and replacing $\tan \theta$, as a variable final tangent of an angle, by $\tan i$ or $dy/dx$,

$$ \tan \phi - \frac{dy}{dx} = C \sec \eta \left[ I(U) - I(u) \right], $$

and integrating with respect to $x$ over the arc considered,

$$ x \tan \phi - \sqrt{x} = C \sec \eta \left[ \sqrt{I(U)} - \sqrt{I(u)} \right]. $$

But

$$ \int \sqrt{I(u)} \, dx = \int \sqrt{I(u)} \frac{du}{g} \left[ \cos \eta \int \frac{du}{g} + A(U) - A(u) \right], $$

in Siacci's notation; so that the altitude-function $A$ must be calculated by summation from the finite difference $\Delta A$, where

$$ \Delta A = I(u) \frac{\Delta u}{g} \left[ A(U) - A(u) \right], $$

or else by an integration which it is legitimate to assume that $f(0) = \sigma_0/k$ in an interval of velocity in which $\eta$ may be supposed constant.

Dividing again by $x$, as given in (76),

$$ \tan \phi \frac{y}{x} = C \sec \eta \left[ I(U) - I(u) \frac{A(U) - A(u)}{S(U) - S(u)} \right], $$

from which $y/x$ can be calculated, and then $\eta$.

In the application of Siacci's method to the calculation of a trajectory in high angle fire by successive arcs of small curvature, starting at the beginning of an arc at an angle $\phi$ with velocity $v$, the curvature of the arc $\phi - \theta$ is first settled upon, and now

$$ \eta = \frac{1}{2}(\phi + \theta) $$

is a good first approximation for $\eta$.

Now calculate the pseudo-velocity $u_0$ from

$$ u_0 = x_0 \cos \phi \, \sec \eta, $$

and then, from the given values of $\phi$ and $\theta$, calculate $u_0$ from either of the formulæ of (72) or (73):

$$ I(u_0) - I(u) = \tan \phi - \tan \theta, $$

$$ D(u) = D(u_0) = \phi^2 - \theta^2. $$

Then with the suffix notation to denote the beginning and end of the arc $\phi - \theta$,

$$ u_0 = C[T(U_0) - T(u)], $$

$$ \phi_0 = C[S(U_0) - S(u)], $$

$$ \phi_0 = C[S(U_0) - S(u)], $$

$$ \phi_0 = \tan \phi - C \sec \eta \left[ I(u) - I(u_0) \frac{\Delta A}{\Delta S} \right]. $$

$A$ now denoting any finite tabular difference of the function between the initial and final (pseudo-) velocity.

Also the velocity $v_0$ at the end of the arc is given by

$$ v_0 = u_0 \, \sec \phi \, \cos \eta. $$

Treating this final velocity $v_0$ and angle $\theta$ as the initial velocity $v_0$ and angle $\phi$ of the next arc, the calculation proceeds as before (fig. 2).

In the long range high angle fire the shot ascends to such a height that the correction for the tenacity of the air becomes important, and the curvature of $\phi - \theta$ of an arc should be so chosen that $v_0$, the height ascended, should be limited to about 1000 ft., equivalent to a fall of 1 inch in the barometer or 3% diminution in the tenacity factor $\mu$.

A convenient rule has been given by Captain James M. Ingalls, U.S.A., for approximating to a high angle trajectory in a single arc, which assumes that the mean density of the air may be taken as the density at two-thirds of the estimated height of the vertex; the rule is founded on the fact that in an unassisted parabolic trajectory the average height of the shot is two-thirds the height of the vertex, as illustrated in a jet of water, or in a stream of bullets from a Maxim gun.

The longest recorded range is that given in 1888 by the 9.2-in. gun to a shot weighing 380 lb fired with velocity 2375 ft/s at elevation 40°; the range was about 12 miles, with a time for flight of about 6 sec., shown in fig. 2.

A calculation of this trajectory is given by Lieutenant A. H. Wolley-Dod, R.A., in the Proceedings R.A. Institution, 1888, employing Siacci's method and about twenty arcs; and Captain Ingalls, by assuming a mean tenacity-factor $\eta = 0.68$, corresponding to a height of about 2 m., on the estimate that the shot would reach a height of 3 m., was able to obtain a very accurate result, working in two arcs over the whole trajectory, up to the vertex and down again (Ingalls, Handbook of Ballistic Problems).

Siacci's altitude-function is useful in direct fire, for giving immediately the angle of elevation $\phi$ required for a given range of yards or feet, between limits $V$ and $v$, and the velocity $\eta$, without having to calculate $\phi$ by any of the formulæ above given.

In direct fire the pseudo-velocities $U$ and $u$, and the real velocities $V$ and $v$, are indistinguishable, and sec $\eta$ may be replaced by unity so that, putting $y = o$ in (79),

$$ \tan \phi = C \left[ I(V) - \frac{\Delta A}{\Delta S} \right]. $$

Also

$$ \tan \phi - \tan \beta = C \left[ I(V) - I(u) \right], $$

so that

$$ \tan \beta = C \left[ \frac{\Delta A}{\Delta S} - I(0) \right], $$

or, as (88) and (90) may be written for small angles,

$$ \sin 2\phi = 2C \left[ I(V) - \frac{\Delta A}{\Delta S} \right], $$

$$ \sin 2\beta = 2C \left[ I(V) - I(u) \right]. $$

To simplify the work, so as to look out the value of $\sin 2\phi$ without the intermediate calculation of the remaining velocity $v$, a double-entry table has been devised by Captain Braccialini Scipione
BALLISTICS

(Problemi del Tiro, Roma, 1883), and adapted to yd., ft., in. and lb.
Institution, 1898, and in Gunnery Tables, 1899.

In this table

\[ \sin 2\phi = C_0 \]

where \( \phi \) is a function tabulated for the two arguments, \( V \) the initial
velocity, and \( R/C \) the reduced range in yards.
The table is too long for insertion here. The results for \( \phi \) and
\( \beta \), as calculated for the range tables above, are also given there for
comparison.

Drift.—An elongated shot fired from a rifled gun does not
move in a vertical plane, but as if the mean plane of the
trajectory was inclined to the true vertical at a small angle, \( \phi \) or \( \beta \);
so that the shot will hit the mark aimed at if the back sight is
tilted to the vertical at this angle \( \delta \), called the permanent angle of
deflection (see Sights).

This effect is called drift and the reason of it is not yet
understood very clearly.

It is evidently a gyroscopic effect, being reversed in direction
by a change from a right to a left-handed twist of rifling, and
being increased by an increase of rotation of the shot.
The axis of an elongated shot would move parallel to itself
only if fired in a vacuum; but in air the couple due to a sidelong
motion tends to place the axis at right angles to the tangent of
the trajectory, and acting on a rotating body causes the axis to
precess about the tangent. At the same time the frictional drag
damps the nutation and causes the axis of the shot to follow the
tangent of the trajectory very closely, the point of the shot
being seen to be slightly above and to the right of the tangent,
with a right-handed twist. The effect is as if there was a mean
sidelong thrust \( w \tan \delta \) on the shot from left to right in order to
deflect the plane of the trajectory at angle \( \delta \) to the vertical.
But no formula has yet been invented, derived on theoretical
principles from the physical data, which will assign by calculation
a definite magnitude to \( \delta \).

An effect similar to drift is observable at tennis, golf, base-ball
and cricket; but this effect is explainable by the inequality of
pressure due to a vortex of air carried along by the rotating
ball, and the deviation is in the opposite direction of the drift
observed in artillery practice, so artillers are still awaiting
theory and crucial experiment.

After all care has been taken in laying and pointing, in accordance
with the rules of theory and practice, absolute certainty of
hitting the same spot every time is unattainable, as causes of
error exist which cannot be eliminated, such as variations in the
air and in the muzzle-velocity, and also in the steadiness of the
shot in flight.

To obtain an estimate of the accuracy of a gun, as much actual
practice as is available must be utilized for the calculation in accordance
with the laws of probability of the 90% zones shown
in the range table (see Probability.)

II. Interior Ballistics

The investigation of the relations connecting the pressure,
volume and temperature of the powder-gas inside the bore of the
gun, of the work realized by the expansion of the powder, of the
dynamics of the movement of the shot up the bore, and of the
stress set up in the material of the gun, constitutes the branch of
interior ballistics.

A gun may be considered a simple thermo-dynamic machine or
heat-engine which does its work in a single stroke, and does not act
in a series of periodic cycles as an ordinary steam or gas-engine.

An indicator diagram can be drawn for a gun (fig. 3) as for a

Fig. 3.

Fig. 4.
steam-engine, representing graphically by a curve CPD the relation between the volume and pressure of the powder-gas; and in addition the curves AOE of energy \( w \), AV of velocity \( v \), and AM of weight of powder as functions of time \( t \) can be plotted or derived, the velocity and energy at the muzzle B being denoted by V and E.

After a certain discount for friction and the recoil of the gun, the net work realized by the powder-gas as the shot advances AM is represented by the area ACPD, and this is equated to the kinetic energy \( e \) of the shot, in foot-tons,

\[
e = \frac{w}{2240} \left( 1 + \frac{k^2}{d^2} \tan^2 \delta \right) \frac{v^2}{2g},
\]

in which the factor \( \frac{k^2}{d^2} \tan^2 \delta \) represents the fraction due to the rotation of the shot, of diameter \( d \) and axial radius of gyration \( k \), and \( \delta \) represents the angle of the rifling; this factor may be ignored in the subsequent calculations as small, less than 1%.

The mean effective pressure (M.E.P.) in tons per sq. in. is represented in fig. 3 by the height AH, such that the rectangle AHKB is equal to the area APDB; and the M.E.P. multiplied by \( \frac{1}{2} \pi d^2 \), the cross-section of the bore in square inches, gives in tons the mean effective pressure on the base of the shot; and multiplied again by \( l \), the length in inches of the travel AB of the shot up the bore, gives the work realized in inch-ton's; which work is thus equal to the M.E.P. multiplied by \( \frac{1}{2} \pi d^2 l = B \cdot C \), the volume in cubic inches of the rifled part AB of the bore, the difference between B and C the total volume of the bore and C the volume of the powder-chamber.

Equating the muzzle-energy and the work in foot-tons

\[
E = \frac{w \cdot V^2}{2240} - \frac{B \cdot C}{12} \cdot M.E.P.
\]

Working this out for the 6-in. gun of the range table, taking \( L = 216 \) in. we find \( B - C = 6 \times 100 \) cub. in., and the M.E.P. is about 6.4 tons per sq. in.

But the maximum pressure may exceed the mean in the ratio of 2 or 3 to 1, as shown in fig. 4, representing graphically the result of Sir Andrew Noble's experiments with a 6-in. gun, capable of being strengthened to 100 calibres or 50 ft. (Proc. R.S., June 1894).

On the assumption of uniform pressure up the bore, practically realizable in a Zalinski pneumatic dynamics gun, the pressure-curve would be the straight line HK of fig. 3 parallel to AM; the energy-curve AOE would be another straight line through A; the velocity-curve AV, of which the ordinate \( v \) is as the square root of the energy, would be a parabola; and the acceleration of the shot being constant, the time-curve AT will also be a similar parabola.

If the pressure falls off uniformly, so that the pressure-curve is a straight line PDF sloping downwards and cutting AM in F, then the energy-curve will be a parabola curve downwards, and the velocity-curve can be represented by an ellipse, or circle with centre F and radius FA; while the time-curve will be a sinusoid.

---

**Fig. 5.**

But if the pressure-curve is a straight line F'CP sloping upwards, cutting AM behind A in F', the energy-curve will be a parabola curve upwards, and the velocity-curve a hyperbola with center at F'.

The pressure-curve may prove useful in preliminary calculations where the pressure-curve is nearly ·straight; but, in the absence of any observable law, the area of the pressure-curve must be read off by a planimeter, or calculated by Simpson's rule, as an indicator diagram.

To measure the pressure experimentally in the bore of a gun, the cruiser-gauge is used as shown in fig. 6, nearly full size; it records the maximum pressure by the compression of a copper cylinder in its interior; it may be placed in the powder-chamber, or fastened in the base of the shot.

In Sir Andrew Noble's researches a number of plugs were inserted in the side of the experimental gun, reaching to the bore and carrying cruiser-gauges, and also chronographic appliances which registered the passage of the shot in the same manner as the electric screens in Bashforth's experiments; thence the velocity and energy of the shot was inferred, to serve as an independent control of the cruiser-gauge records (figs. 4 and 5).

As a preliminary step to the determination of the pressure in the bore of a gun, it is desirable to measure the pressure obtained by exploding a charge of powder in a closed vessel, varying the weight of the charge and thereby the density of the powder-gas.

The earliest experiments of this nature are due to Benjamin Robins in 1743 and Count Rumford in 1792; and their method has been revived by Dr Kellner, War Department chemist, who employed the steel spheres of bicycle ball-bearings as safety-valves, loaded to register the pressure at which the powder-gas will blow off, and thereby check the indications of the cruiser-gauge (Proc. R.S., March 1895).

Chevalier d'Arcy, 1760, also experimented on the pressure of powder and the velocity of the bullet in a musket barrel; this he accomplished by shortening the barrel successively, and measuring the velocity obtained by the ballistic pendulum; thus reversing Noble's procedure of gradually lengthening the gun.

But the most modern results employed with gunpowder are based on the experiments of Noble and Abel (Phil. Trans., 1875-1880-1892-1894 and following years).

A charge of powder, or other explosive, of varying weight \( p \) lb., is fired in an explosion-chamber (fig. 7, scale about \( \frac{1}{4} \)) of which the volume \( C \), cub. in., is known accurately, and the pressure \( p \) tons per sq. in., was recorded by a cruiser-gauge (fig. 6).
The result is plotted in figs. 8 and 9, in a curve showing the relation between $\rho$ and $D$ the gravimetric density, which is the specific gravity of the $P$ lb of powder when filling the volume $C$, cub. in., in

**EXPLOSION VESSEL**

![Fig. 7.](image)

a state of gas; or between $\rho$ and $\gamma$, the reciprocal of $D$, which may be called the gravimetric volume (G. V.), being the ratio of the volume of the gas to the volume of an equal weight of water.

The results are also embodied in the following Table:

</table>

The term gravimetric density (G.D.) is peculiar to ballisticians; it is required to distinguish between the specific gravity (S. G.) of the powder filling a given volume in a state of gas, and the specific gravity of the separate solid grain or cord of powder.

Thus, for instance, a lump of solid lead of given S. G., when formed into a charge of lead shot composed of equal spheres closely packed, will have a G.D. such that

(4) G.D. of charge of lead shot 1

\[ \text{S.G. of lump of solid lead} = \sqrt[3]{2 \times 0.7493} \]

while in the case of a bundle of cylindrical sticks of cordite,

(5) G.D. of charge of cordite 1

\[ \text{S.G. of stick of cordite} = \sqrt[3]{3} \times 0.9067 \]

At the standard temperature of 60° F, the volume of the gallon of 10 lb of water is 277-3 cub. in.; or otherwise, 1 cub. ft. or 1728 cub.

**PRESSURES OBSERVED IN A CLOSED VESSEL WITH VARIOUS EXPLOSIVES**

![Fig. 8.](image)

**GRAVIMETRIC DENSITY OF PRODUCTS OF EXPLOSION**

in. of water at this temperature weighs 62.35 lb, and therefore 1 lb of water bulks 1728-62.35 = 27-73 cub. in.

Thus if a charge of P lb of powder is placed in a chamber of volume $C$ cub. in., the

(6) G.D. = 27.73P/C, G.V. = C/27.73 P

Sometimes the factor 27-73 is employed, corresponding to a density of water of about 62-74 lb per cub. ft., and a temperature 12° C., or 54° F.

With metric units, measuring $P$ in kg., and $C$ in litres, the G.D. = $P/C$, G.V. = $C/P$, no factor being required.

From the Table 1., or by quadrature of the curve in fig. 9, the work $E$ in foot-tons realized by the expansion of $1$ lb of the powder from one gravimetric volume to another is inferred: for if the average pressure is $\rho$ tons per sq. in., while the gravimetric volume changes from $V = \frac{1}{\rho}$ to $V + \frac{1}{\rho}$, a change of volume of 27-73 $\Delta V$ cub. in., the work done is 27-73 $\rho$ $\Delta V$ foot-tons, or

(7) $\Delta E = 27.73 \rho$ $\Delta V$ foot-tons;

and the differences $\Delta E$ being calculated from the observed values of $\Delta V$, summation, as in the ballistic tables, would give $E$ in a tabular form, and conversely from a table of $E$ in terms of $\gamma$, we can infer the value of $\rho$.

On drawing off a little of the gas from the explosion vessel it was found that a gramme of cordite-gas at 0° C. and standard atmospheric pressure occupied 700 ccc., while the same gas compressed into 5 ccc. at the temperature of explosion had a pressure of 16 tons per sq. in., or $16 \times 2440 = 14720$ atmospheres, of 14-7 lb per sq. in.; one ton per sq. in. being in round numbers 150 atmospheres.

The absolute conjugate temperature $T$ is thence inferred from the gas equation

(8) $R = \rho V/T = \rho V \omega/273$,

which, with $\rho = 2440$, $\omega = 5$, $\omega_0 = 1$, $\omega = 700$, makes $T = 4758$, a temperature of $448°$ C. or $810°$ F.

**PRESSURE IN A CLOSED VESSEL OBSERVED AND CALCULATED**

![Fig. 9.](image)

In the heading of the 6-in. range table we find the description of the charge.

Charge: weight 13 lb 4 oz.; gravimetric density 55-01/0-504; nature, cordite, size 30.

So that $P = 13-25$, the G. D. = 0-504, the upper figure 55-01 denotes the specific volume of the charge measured in cubic inches per lb, filling the chamber in a state of gas, the product of the two numbers 55-01 and 0-504 being 27-73; and the chamber capacity considered complete at this stage $P$, and in the subsequent expansion, as inferred from the expansion of the charge should prevent the maximum pressure from exceeding a safe limit, as shown by the maximum ordinate of the pressure curve CPD in fig. 3.

If the shot were fixed at 16 tons per sq. in., corresponding to G. D. 0-2; the powder-gas will now occupy a volume $b = 3C = 1852$ cub. in., corresponding to an advance of the shot $t = 2-15 = 3-225$ ft.

Assuming an average pressure of 8 tons per sq. in., the shot will have acquired energy $8 \times 10 \times 3-225 = 730$ foot-tons, and a velocity about $v = 1020$ l/s, so that the time over the 3-225 ft. at an average velocity 510 l/s is about 0-0065 sec.

Comparing this time with the experimental value of the time occupied by the cordite in burning, a start is made for a fresh estimate and a closer approximation.

Assuming, however, that the agreement is close enough for practical requirement, the combustion of the cordite may be considered complete at this stage $P$, and in the subsequent expansion it is assumed that the gas obeys an adiabatic law in which the pressure varies inversely as some $m^6$ power of the volume.

The work done in expanding to infinity from $\rho$ tons per sq. in.
at volume $b$ cub. in. is then $\frac{p_b}{m-1}$ inch-tones, or to any volume $B$ cub. in. is

$$\frac{p_b}{m-1} [1 - \left( \frac{m}{B} \right)^{m-1}]$$

It is found experimentally that $m = 1.2$ is a good average value to take for cordite; so now supposing the combustion of the charge of cordite to be complete in 1.00 sec., when $p = 16$ tons per sq. in., $b = 1825$ cub. in., and that the gas expands adiabatically up to the muzzle, where

$$B = \frac{216 + 25.8}{b^{2/5}}$$

we find the work realized by expansion is 2826 foot-tons, sufficient to increase the velocity from 1020 to 2390 f/s at the muzzle.

The muzzle velocity is about 12% greater than the 2150 f/s of the range table, so on these considerations we may suppose about 10% of work is lost by friction in the bore: this is expressed by saying that the factor of effect is $f = 0.9$.

The experimental determination of the time of burning under the influence of the varying pressure and density, and the size of the grain, is thus of great practical importance, as it is possible to estimate close limits to the maximum pressure that will be reached in the bore of a gun, and to design the chamber so that the C.D. of the charge may be suitable for the weight and acceleration of the shot. Empirical formulas based on practical experience are employed for an approximation to the result.

A great change has come over interior ballistics in recent years, as the old black gunpowder has been abandoned in artillery after holding the field for six hundred years. It is replaced by modern explosives such as those indicated on fig. 4, capable of giving off a very much larger volume of gas at a greater temperature and pressure, more than threefold as seen on fig. 8, so that the charge may be reduced in proportion, and possessing the military advantage of being nearly smokeless. (See Explosives).

The explosive cordite is adopted in the British service; it derives its name from its appearance as cord in short lengths, the composition being squeezed in a viscous state through the hole in a die, and the cordite is designated in size by the number of hundredths of an inch in the diameter of the hole. Thus the cordite, size 30, of the range table has been squeezed through a hole 0.30 in. diameter.

The thermophysical properties of the constituents of an explosive will assign an upper limit to the volume, temperature and pressure of the gas produced by the combustion; but much experiment is required in addition. Sir Andrew Noble has published some of his results in the Phil. Trans., 1905–1906 and following years.

**BALLOON**

A globular bag of varnished silk or other material impermeable to air, which, when inflated with gas lighter than common air, can be used in aeronautics, or, according to its size, &c., for any purpose for which its ability to rise and float in the atmosphere adapts such a mechanism. “Balloon” in this sense was first used in 1783 in connexion with the invention of the brothers Montgolfier, but the word was in earlier use (derived from Ital. ballone, a large ball) as meaning an actual ball or ball-game, a primitive explosive bomb or firework, a form of chemical retort or receiver, and an ornamental globe in architecture; and from the appearance and shape of an air balloon the word is applied by analogy to other things, such as a “balloon skirt” in dress, “balloon training” in horticulture. (See AERONAUTICS, and FLIGHT AND FLYING.)

**BALLOT**

From Ital. ballo, dim. of balla, a ball, the modern method of secret-voting employed in political, legislative and judicial assemblies, and also in the proceedings of private clubs and corporations. The name comes from the use of a little ball dropped according to choice into the right receptacle; but nowadays it is used for any system of secret-voting, even though no such ball is employed. In ancient Athens, the voters, in giving their verdict, generally used balls of stone (petra) or of metal (spoudæ). Those pierced in the centre, or black in colour, signified condemnation; those unpierced, or white, signified acquittal. The boxes were variously arranged; but generally a brass box received both classes of votes, and a wooden box received the unused balls. In the assembly, cases of privilege, such as ostracism, the naturalization of foreigners or the release of state-debtors, were decided by secret-voting. The petition, or voting by words on olive-leaves, practised at Syracuse, may also be mentioned. At Rome the ballot was introduced to the comitia by the Lex Gabinia (139 B.C.) relates to the election of magistrates, the Lex Cassia (137 B.C.) to juridice popular, and the Lex Paporia (131 B.C.) to the enactment and repeal of laws. The wooden tabellae, placed in the eista or wicker box, were marked U. R. (sui rogas) and A. (antiquus) in the case of a proposed law; L. (libero) and D. (damnō) in the case of a public trial; in the case of an election, puncta were made opposite the names or initials of the candidates. Tabellae were also used by the Roman judges, who expressed their verdict or judgment by the letters A. (absolu), C. (condemno), and N. L. (non liquet). In modern times voting by ballot is usually by some form of writing, but the use of the ball still persists (especially in clubs), and a “black ball” is the regular term for a hostile vote.

**Great Britain.**—In Great Britain the ballot was suggested for use in parliament by a political tract of the time of Charles II. It was actually used by the Scots parliament of 1662 in proceeding on the Bill of Rights, a measure proposed by Middleton to secure the ostracism of Lauderdale and other political opponents who were by secret-vote declared incapable of public office. The plan followed was this: each member of parliament wrote, in a discreet box, a piece of paper with the name of any suspected persons; the billets were put in a bag held by the registrar; the bag was then sealed, and was afterwards opened and its contents ascertained in the exchequer chamber, where the billets were immediately burned and the names of the ostracised concealed on oath. The Bill of Rights was repudiated by the king, and the ballot was not again heard of till 1705, when Fletcher of Saltonstall, in his measure for a provincial government of Scotland by annual parliaments in the event of Queen Anna’s death, proposed secret-voting to protect members from court influence. The gradual emancipation of the British parliament from the power of the crown, and the adoption of a strictly representative system of election, not only destroyed whatever reason may once have existed for the ballot in deliberative voting, but rendered it essential that such voting should be open. It was in the agitation for parliamentary reform at the beginning of the 19th century that the demand for the ballot in parliamentary elections was first seriously made. The Benthamites advocated the system in 1817. At the so-called Peterloo Massacre (1819) several banners were inscribed with the ballot. O’Connell introduced a bill on the subject in 1830; and the original draft of Lord John Russell’s Reform Bill, probably on the suggestion of Lords Durham and Duncannon, provided for its introduction. Later on the historian Grote became its chief supporter in the House of Commons; and from 1835 to 1839, in spite of the ridicule cast by Sydney Smith on the “mouse-trap,” and on Grote’s “dagger-box, in which you stab the card of your favourite candidate with a dagger,” the minority for the ballot increased from 105 to 217. In 1838 the ballot was the fourth point of the People’s Charter. In the same year the abolition of the land qualification introduced rich commercial candidates to the constituencies. Lord Melbourne’s cabinet declared the question open. The cause, upheld by Macaulay, Ward, Hume (in his resolutions, 1848) and Berkeley, was strengthened by the report of Lord Hartington’s Select Committee.

1 For a description of Grote’s card-frame, in which the card was punctured through the hole, and was thus never in the voter’s hands, see Spectator, 18th February 1837.
BALLOT

(15th March 1870), to the effect that corruption, treating and intimidation by priests and landlords took place to a large extent at both parliamentary and municipal elections in England and Ireland; and that the ballot, if adopted, would probably not only promote tranquillity at elections, but protect voters from undue influence, and introduce greater freedom and purity in voting, provided secrecy was made inviolable except in cases where a voter was found guilty of bribery, or where an invalid vote had been given.

Meanwhile in Australia the ballot had been introduced by the Constitution Act of South Australia (1856), and in other colonies at the same date. In South Australia (Electoral Act of 1858) the returning-officer put his initials on the voting-card, which the voter was directed, under pain of nullity, to fold so that the officer might not see the vote which was indicated by a cross. In Victoria, under the Electoral Act of 1865, the officer added to his initials a number corresponding to the voter's number on the register. In Tasmania the chief peculiarity was that (as in South Australia) the card was not put directly by the voter into the box, but handed to the officer, who put it there (this being thought a security against double-voting or voting with a non-official card, and also against the voter carrying away his card). In 1869, at Manchester and Stafford in England, test-ballots were taken on the Australian system, but with the additional feature that the names of all the candidates, printed in different colours (for the benefit of illiterate voters), and the voter being directed to score out the names of those he did not support, and then to place the card (covered by an official envelope) in the box. It was found at Manchester that the voting was considerably more rapid, and therefore less expensive, than under the old system; that only 80 cards out of 11,475 were rejected as informal; and that the representatives of candidates being present to check false statements of identity, and the public outside being debarred from receiving information what voters had voted, the ballot rather decreased the risk of personation. At Manchester the cards were not numbered consecutively, as in Victoria, so that (assuming the officials to be free from corruption) no scrutiny might have been detected by whom particular votes were given. At Stafford the returning-officer stamped each card before giving it to the voter, the die of the stamp having been finished only on the morning of the election. By this means the possibility was excluded of what was known as "the Dodger" by which a corrupt voter gave to the returning-officer, or placed in the box, a blank non-official ticket, and carried out from the booth his own card, which a corrupt officer marked for his candidate, and gave so-marked to corrupt voter No. 2 (before he entered the booth) on condition that he also would bring out his official card, and so on ad libitum; the agent thus obtaining a security for his bribe, unless the corrupt voter chose to disfranchise himself by making further marks on the card. At the close of 1870 the ballot was employed in the election of members for the London School Board under the Education Act of that year.

In 1872 W. E. Forster's Ballot Act introduced the ballot in all parliamentary and municipal elections, except parliamentary elections for universities; and the code of procedure prescribed by the act was adopted by the Scottish Education Board in the first School Board election (1873) under the Education (Scotland) Act 1872. The Ballot Act not only abolished public nominations of candidates, but dealt with the offence of personation and the expenses of elections.

As practised in the United Kingdom, a white paper is used on which the names of the candidates are printed in alphabetical order, the voter filling up with a X the blank on the right-hand side of the official card, the box, before being given out, is marked by the presiding-officer on both sides with an official stamp, which is kept secret, and cannot be used for a second election within seven years. The paper is marked on the back with the same number as the counterfoil of the paper which remains with the officer. This counterfoil is also marked with the voter's number on the register, so that the vote may be identified on a scrutiny; and a mark on the register shows that the voter has received a ballot-paper. The voter folds up the paper so as to conceal his mark, but to show the stamp to the officer, and deposits it in the box, which is locked and sealed, and so constructed that papers cannot be withdrawn without unlocking it. Papers inadvertently spoiled by the voters may be exchanged, the officer preserving separately the spoiled papers. If a voter is incapacitated from blindness, or other physical cause, or makes before the officer a declaration of inability to read, or when the poll is on a Saturday declares himself a Jew, the officer causes the paper to be marked as the voter directs, and keeps a record of the transaction. A voter who claims to vote after another has voted in respect of the same qualification, obtains a (green) paper which is not placed in the box, but preserved apart as a "tendered" paper. He must, however, declare his identity and that he has not already voted. The presiding-officer at the close of the poll has to account to the returning-officer for the papers entrusted to him, the number being made up by—(1) papers in the box, (2) spoiled papers, (3) unused papers and (4) tendered papers. During the voting (for which schoolrooms and other public rooms are available, and for which a separate compartment must be provided for every 150 electors entitled to vote at a station) agents of candidates are allowed to be present in the polling-station, but they, as well as the officials, are sworn to secrecy, and are not to be shown in which box (if any) the votes are being placed for whom, and they are prohibited from interfering with the voter, inducing him to show his vote, or attempting to ascertain the number on the back of the paper. These agents are also present with the returning-officer when he counts the papers and the votes, rejecting those papers—(1) which want the official mark on the back; (2) on which votes are given for more candidates than the voter is entitled to vote for; (3) on which anything except the number on the back is marked or written by which the voter can be identified; (4) which are unmarked, or so marked that it is uncertain for whom the vote is given. The counted and rejected papers, and also the "tendered" papers, counterfoils and marked register (which have not been opened), are, in parliamentary elections, transmitted by the returning-officer to the clerk of the crown in chancery in England, or the sheriff-clerk in Scotland, who destroys them at the end of one year, unless otherwise directed by an order of the House of Commons, or of some court having jurisdiction in election petitions. Such petitions either simply dispute the accuracy of the return on the ground of misconduct, or wrongful rejection or wrongful admission of papers, in which case the court examines the marked and rejected papers; or make allegations of corruption, &c. on which it may be necessary to refer to the marked counterfoils and ascertain how bribed voters have voted. Since the elections of 1874 much discontent has been expressed, because judges have rejected papers with trifling (perhaps accidental) marks other than the X upon them, and because elections have been lost through the failure of the officer to stamp the papers. For this purpose the use has been suggested of a perforating instead of an embossing stamp, while a dark-ground paper with white voting-spaces would make misplaced votes impossible.

The Ballot Act introduced several new offences, such as forging of papers or fraudulently defacing or destroying a paper or the official mark; supplying a paper without due authority; fraudulently putting into the box a non-official paper; fraudulently taking a paper out of the station without due authority; destroying, taking, opening or otherwise interfering with a box or packet of papers then in use for election purposes. These offences and attempts to commit them are punishable by fine and by imprisonment for two years, or without hard labour. In other cases the term of imprisonment is six months.

The ballot was long criticized as leading to universal hypocrisy and deception; and Sydney Smith spoke of "voters, in dominoes, going to the poll in sedan-chairs with closely-drawn curtains." The observed effect of a secret ballot has been, however, gradually to exterminate undue influence. The alarm of the "confessional" seems to be unfounded, as a Catholic penitent is not bound to
confess his vote, and if he did so, it would be a crime in the
conserver to divulge it.

Continental Europe.—The ballot is largely employed in
European countries. In France, where from 1840 to 1845 the
ballot, or scrutin, had been used for deliberative voting in
the chamber of deputies, its use in elections to the Corps Législatif
was carefully regulated at the beginning of the Second Empire
by the Organic Decree of the 2nd of February 1852. Under this
law the voting was supervised by a bureau consisting of the
deputy returning-officer (called president of the section), four
unpaid assessors selected from the constituency and a secretary.
Each voter presents a polling-card, with his designation, date of
birth and signature (to secure identity), which he had previously
got at the Mairie. This the president mutinates, and the vote
is then recorded by a “bulletin,” which is not official, but is
generally printed with a candidate’s name, and given to the
voter by an agent outside, the only conditions being that the
bulletin shall be “sur papier blanc, sans signes extérieurs, et
préparé en dehors de l’assembly.” The total number of votes
given (there being only one member in each electoral district)
is checked by reference to “la feuille d’appel” to include the
voters,” the law still supposes, that each voter is publicly
called to vote. If the voter, when challenged, cannot sign
his polling-card, he may call a witness to sign for him.
The following classes of bulletins are rejected:—“illisibles, blancs,
ne contenant pas une désignation suffisante; sur lesquels les
votants se sont fait connaître; contenant le nom d’une personne
n’ayant pas prêté le serment prescrit” (i.e. of a person
not nominated).

Only the votes pronounced bad by the bureau
in presence of representative scrutineers are preserved, in
case these should be called for during the “Session pour vérification
de l’ouvrage.” Practically the French ballot did not afford
privacy, for you might observe what bulletin the voter took from
the agent, and follow him up the queue into the polling-place;
but the determined voter might conceal his vote even from the
undue influence of government by scratching out the printed
matter and writing his vote. This was always a good vote
and scrutiny of good votes was impossible. The ballot is still
used in the elections to the National Assembly, but in the Assembly
itself only in special cases, as e.g. in the election of a “rapporteur.”

Under the Ancien Régime, the councils généraux (departmental councils) are elected by ballot.

In Piedmont the ballot formed part of the free constitutional
government introduced by Charles Albert in March 1848; it was
extended to Italy in 1861. Voting for the Italian chamber of
depputies takes place under the law of 20th November 1859,
and in public halls (not booths), to which admission is gained by
showing a certificate of inscription, issued by the mayor to each
qualified voter. A stamped blue official paper, with a membrorum
of the law printed on the back (bolletino spiegato), is then
issued to the voter; on this he writes the name of a candidate
there being equal electoral colleges) or, in certain exceptional
cases, gets a confidential friend to do so, and hands the paper
folded-up to the president of the bureau, who puts it in the box
(armo), and who afterwards presides at the public “squitinio
del suffragi.” Greece is the only European country in which
the ball-ballot is used. The voting takes place in the churches,
each candidate has a box on which his name is inscribed, one
half (white) being also marked “yes,” the other half (black)
“no.” The voter, his citizenship or right to vote in the eparchy
being verified, receives one ball or leaden bullet for each candidate
from a wooden bowl, which a clerk carries from box to box. The
voter stretches his arm down a funnel, and drops the ball into
the “yes” or “no” division. The vote is secret, but there is
apparently no check on “yes” votes being given for all the
candidates, and the ball or bullet is imitable.

The earlier history of the ballot in Hungary is remarkable.
Before 1848 secret voting was unknown there. The electoral
law of that year left the regulation of parliamentary elections
by the county and town councils, very few of which adopted the
ballot. The mode of voting was perhaps the most primitive
on record. Each candidate had a large box with his name
superscribed and painted in a distinguishing colour. On
entering the room alone the voter received a rod from 4 to 6 feet
in length (to prevent concealment of non-official rods on
the voter’s person), which he placed in the box through a slit in the
lid. By the electoral law of 1874 the ballot in parliamentary
elections in Hungary was abolished, but was made obligatory
in the elections of town and county councils, the voting being
for several persons at once.

In Prussia, Stein, by his Städtedirekt, or municipal
corporation act of 1808, introduced the ballot in the election of
the municipal assembly (Städtedirektversammlung). Under
the German constitution of 1867, and the new constitution of
the 1st of January 1871, the elections of the Reichstag were
to be conducted by universal suffrage under the ballot in con-
formity with the electoral law of the 31st of May 1869.

America.—At the first elections in America voting was viva
voice; but several of the colonies early provided for the use of
written or printed ballots. By 1775 ballots were used in the New
England states, in Pennsylvania, Delaware, North Carolina and
South Carolina; they were introduced in New Jersey in 1776,
and in New York in 1786, so that, at the time the constitution
of the United States was adopted, voting prevails at public
elections only in Maryland, Virginia, and Georgia, and in the
new states which later entered the Union, only Illinois, Kentucky,
Missouri and Arkansas did not have a ballot system when they
became states.

During the first half of the 19th century, Maryland, Georgia, Arkansas (1846) and Illinois (1848) adopted the
ballot. In Missouri ballot-voting was introduced to some
localities in 1845, but not until 1863 was it generally adopted in
that state. Virginia did not provide for voting by ballot until
1869, and in Kentucky viva voce voting continued until 1819,
but while the use of ballots was thus required in voting, and
most of the states had laws prescribing the form of ballots and
providing for the count of the vote, there was no provision
making it the duty of any one to print and distribute the ballots
at the polling-places on election day. In the primitive town
meetings ballots had been written by the voters, or, if printed,
were furnished by the candidates. With the development of
elections, the task of preparing and distributing ballots fell
to political committees for the various parties. The ballot-
tickets were thus prepared for party-lists of candidates, and it
was not until 1880 that a mixed ballot, or a ballot with ballots
for all the candidates arranged alphabetically for each office,
the voters to vote by marking the name of each candidate for
whom they wished to vote. At the presidential election of 1888
it was freely alleged that large sums of money had been raised on
an unprecedented scale for the purchase of votes, and this
situation in some cases developed into a movement for the
introduction of secret ballots in the United States. A number of
laws were passed in the 1880s, and in 1889 the Uniform
Ballot Law was passed in a number of states, including
Massachusetts, New York, and Illinois. These laws required
the use of printed ballots, and in some cases provided for
the counting and certification of votes by a bipartisan board of
electors. The Uniform Ballot Law was not uniformly
adopted, and in some states secret ballots remained in use.

The movement for secret voting continued into the 20th
century, with the introduction of the use of secret ballot
in presidential elections in the United States in 1908. The
use of secret ballots continues today in the United States,
with variations in the laws governing the use of ballots,
including the use of punch cards, electronic voting machines,
and mail-in ballots in some states.
mark. Michigan and Missouri also adopted the party-group system. The other states followed the Massachusetts law providing for a blanket ballot with the candidates arranged by offices.

The new ballot system had its first practical demonstration at the Massachusetts election of 1839, and its success led to its rapid adoption in many other states. In 1890 ballot laws were passed in seven states: Vermont, Mississippi, Wyoming and Washington provided for the Massachusetts plan, although Vermont afterwards adopted the system of party-groups, which Maryland used from the first. The New York and New Jersey laws of 1890, however, only provided for official ballots for each party, and allowed ballots obtained outside of the polling-booths to be used. In 1891 seventeen additional states and two territories adopted the Australian ballot system. All of these provided for a blanket ballot; but while the Massachusetts arrangement was adopted in Arkansas, Nebraska, New Hampshire, North and South Dakota, Kentucky, Texas and Oregon, the system of party groups was followed in Colorado, Delaware, Illinois, Maine, Ohio, Pennsylvania and West Virginia. California had the Massachusetts arrangement of names, but added on the ballot a list of party names, by marking one of which a voter would cast his vote for all of the candidates of that party. Pennsylvania placed all the candidates not in a party group in alphabetical order.

Iowa adopted the Australian ballot system in 1892; Alabama and Kansas in 1893; Virginia in 1894; Florida in 1895; and Louisiana and Utah in 1896. In 1895, too, New York adopted the blanket ballot in place of separate party ballots, but arranged the names of candidates in party columns. The only state to abandon the blanket ballot after once adopting it was Missouri, which in 1897 returned to the system of separate ballots, with no provision for booths where the ballot might be marked in secret. (See the article "Present Status of the Ballot Laws," by Arthur Ludington in Amer Pol. Science Rev. for May 1900.)

Owing to the large number of official choices at one time in American elections, the form and appearance of the ballot used is very different from that in Great Britain. At the quadrennial presidential election in New York state, for example, the officers to be voted for by each electorate are thirty-six presidential electors, one congressman, state governor, lieutenant-governor and five other state officers; a member for each house of the state legislature, several judges, a sheriff, county clerk and other county officers. The column with the list of the candidates of each party for all of these offices is 2 to 3 ft. in length; and as there are often eight to ten party-tickets in the field, the ballot-paper is no smaller. Each voter receives one of these "blank" ballots on entering the polling-place, and retires to a booth to mark either a party column or the individual candidates in different columns for whom he wishes to vote. Where, as in Massachusetts, the names of candidates are arranged by offices instead of in party lists, every voter must mark the name of each individual candidate for whom he wishes to vote. Connecticut, New Jersey, Missouri, North and South Carolina, Georgia and New Mexico use the system of separate party ballots. (See also Voting, Voting Machines, Election, Representation.)

BALLOU, HOSEA (1771-1852), American Universalist clergyman, was born in Richmond, New Hampshire, on the 30th of April 1771. He was a son of Maturin Ballou, a Baptist minister, who was self-educated, early devoted himself to the ministry, became a convert to Universalism in 1789, and in 1794 became a pastor of a congregation at Damariscotta, Massachusetts. He preached at Barnard, Vermont, and the surrounding towns in 1801-1807; at Portsmouth, New Hampshire, in 1807-1815; at Salem, Massachusetts, in 1815-1817; and as pastor of the Second Universalist Church in Boston from December 1817 until death there on the 7th of June 1832. He founded and edited The Universalist Magazine (1819; later called The Trumpet) and The Universalist Expositor (1831; later The Universalist Quarterly Review); wrote about 10,000 sermons, many hymns, essays and polemical theological works; and is best known for Notes on the Parables (1804), A Treatise on Atonement (1805) and Examination of the Doctrine of a Future Retribution (1834); in these, especially the second, he showed himself the principal American expositor of Universalism. His great contribution to his Church was the body of denominational literature he left. From the theology of John Murray, who like Ballou has been called "the father of American Universalism," he differed in that he divested Universalism of every trace of Calvinism and opposed legalism and trinitarian views.

Consult the biography by Thomas Whittemore (4 vols., Boston, 1854-1855) and that by Oscar F. Safford (Boston, 1889) and J. C. Adams, Hosea Ballou and the Gospel Renaissance (Boston, 1904).

His grand-nephew, HOSEA BALLOU (1796-1861), born in Halifax, Vermont, on the 18th of October 1796, preached to Universalists in Stafford, Connecticut (1815-1821); and in Massachusetts, in Roxbury (1821-1838) and in Medford (1838-1893); and in 1853 was elected first president of Tufts College at Medford, serving in that office until shortly before his death, which took place at Somerville, Massachusetts, on the 27th of May 1861. He was the first (1847) to urge the necessity of a Universalist denominational college, and this did much towards the establishment of Tufts. He was associated with the elder Heman Ballou in editing The Universalist Quarterly Review; edited an edition of Simondi's History of the Crusades (1853); and wrote the Ancient History of Universalism, down to A.D. 553 (1849; 2nd ed., 1842).

HENRY MERRILL BALLOU (1802-1893), son of the first Heman, was a pioneer in American illustrated journalism, edited Gleason's Pictorial and Ballou's Monthly and many collections of quotations, and in 1872 became editor-in-chief of the Boston Daily Globe, of which he was one of the founders. He wrote a life of his father (1860), and a History of Cuba (1854).

BALLSTON SPA, a village and the county-seat of Saratoga county, New York, U.S.A., about 7 m. S. of Saratoga Springs. Pop. (1890) 3527; (1901) 3923; (1910 U.S. Census) 4188. It is served by the Delaware & Hudson railway, and is connected with Saratoga Springs, Albany, and Schenectady by electric lines. There are several manufacturing establishments, among which are one of the largest manufactories of paper-bags in the United States and a large tannery. It is, however, a popular summer resort that Ballston Spa is best known. Many fine chalybeate and other springs rising through solid rock from a depth of about 65 ft. furnish a highly effervescing water of considerable medicinal and commercial value. The village has the Ballston Spa public library, the Saratoga county law library and the Saratoga county court house. Ballston Spa, which was named in honour of the Rev. Elisha Ball, an early settler of the place, was settled about 1787 by the grandfather of Stephen A. Douglas, and was incorporated in 1858.

See E. F. Prose, Centennial Hist. of Ballston Spa, 1898.

BALLYCASTLE, a seaport and watering-place on the north coast of Co. Antrim, Ireland, in the north parliamentary division, situated on a bay of the same name opposite Rathlin Island. Pop. (1901) 1481. It is connected with the Northern Counties (Midland) railway at Ballymoney by the Ballycastle light railway. The town consists of two divisions, about a quarter of a mile apart and connected by a fine avenue. Towards the close of the 18th century Mr. Hugh Boyd, obtaining the estate, devoted himself to the extension and improvement of the town, establishing manufactures, endowing charities and building churches; and succeeded in producing a temporary vitality. Upwards of £15,000, including a large government grant, is said to have been expended upon the pier and harbour; but the violence of the sea overthrew the one and the other became filled with sand. To the east of the town are the remains of Bonamargy Abbey, the burial-place of many of the Maclean family. The Carey brook, by the side of which the abbey stands, was formerly called the Meara; and on its water according to tradition dwelt the fair children Lir, changed to swans by their step-mother until St. Columba released them from enchantment. (See P. W. Joyce, Old Celtic Romances.)

With this well-known romance is connected the wide-spread belief in Ireland of ill-fortune following the killing of a swan. Coal-seams, formerly extensively worked, and from an unknown
period of antiquity, appear in the cliffs towards Fair Head, and the fisheries are important. The coast-scenery and the view from the hill of Knockladey are notable.

**BALLYMENA**, a town of Co. Antrim, Ireland, in the mid parliamentary division, on the Braid, an affluent of the Maine, 2 m. above their junction. Pop. of urban district (1901) 10,886. It is 33 m. N.N.W. of Belfast on the Northern Counties (Midland) railway. Branch lines run to Larne and to Parkmore on the east coast. It owes its prosperity chiefly to its linen trade, introduced in 1733, which gives employment to the greater part of the inhabitants. Brown linen is a specialty. Iron ore is raised in the neighbourhood. Antiquities in the neighbourhood are few and the present buildings of Ballymena Castle and Galgorm Castle are modern. Gracehill, however, a Moravian settlement, was founded in 1746.

**BALLYMONEY**, a market town of Co. Antrim, Ireland, in the north parliamentary division, 53 m. N.N.W. from Belfast by the Northern Counties (Midland) railway. Pop. of urban district (1901) 2952. The Ballycastle railway joins the main line here. The trade of the town is prosperous, brewing, distilling and tanning being carried on, besides the linen manufacture common to the whole county. Soap, candles and tobacco are also manufactured, and to a less extent, local sugar for local agricultural trade. Near the neighbouring village of Dervock (4 m. N.) is a cottage shown by an inscription to have been the home of the ancestors of William McKinley, president of the United States.

**BALLYMOTE**, a market town of Co. Sligo, Ireland, in the south parliamentary division, 14 m. S. of Sligo by the Midland Great Western railway. Pop. (1901) 997. It is a centre for some agricultural trade and has carriage-building works. There are remains of a strong castle, built by the powerful earl of Ulster, Richard de Burgh, in 1300, and the scene of hostilities in 1641 and 1652. Ruins are also seen of a Franciscan foundation attributed to the 13th century; it was a celebrated seat of learning and an extant memorial of the work of its monks is the Book of Ballymote (c. 1391) in the possession of the Royal Irish Academy, a miscellaneous collection in prose and verse of historical, genealogical and romantic writings. There are also, near the town, ruins of a house of the Knights of St John (1303).

**BALLYSHANNON**, a seaport and market-town of Co. Donegal, Ireland, in the south parliamentary division, at the mouth of the Erne on the Bundoran branch of the Great Northern railway. The town is skirted by a bridge of twelve arches, which connects the town with the suburb of The Port. Below the bridge the river forms a beautiful cascade, 150 yds. wide, with a fall at low water of 16 ft. Here is the salmon leap, where the fish are trapped in large numbers, but also assisted to mount the fall by salmon-ladders. The fisheries are of great value, and there is an export trade to England in salmon, which are despatched in ice. The harbour is a small exposed creek of Donegal Bay, and is only accessible to small vessels owing to a bar. Previous to the Union Ballyshannon returned two members to the Irish parliament and it was incorporated by James I. There are slight remains of a castle of the O'Donnells, earls of Tyrconnell, where the English, on attempting to besiege it, were defeated and lost heavily in their retreat across the river, in 1597. There are numerous raths or encampments in the vicinity and other remains. Coolmore, 3 m. N.W., is a bathing-resort.

**BALM*, a fragrant herb, *Melissa officinalis*, of the Deadnettle order (*Labiatae*) with opposite, ovate, crenulated leaves, which are very pubescent, and small white or rose-scented flowers. It is a native of central and southern Europe, it is grown in gardens and has become naturalized in the south of England and grows apparently wild as a garden escape in North America. The name is from the Greek μήλη, the plant being visited by bees. Bastard Balm is an allied plant, *Melitis Melissa phyllum*, a southern European species, found in the south and south-west of England.

**BALSACEDA, JOSÉ MANUEL** (1838-1891), president of the republic of Chile, was born in Santiago in 1838. His parents were wealthy, and in his early days he was chiefly concerned in industrial and agricultural enterprise. In 1865 he was one of the representatives of the Chilean government at the general South American congress at Lima, and after his return obtained great distinction as an orator on the national assembly. After discharging some diplomatic missions abroad, he became successively minister of foreign affairs and of the interior under the presidency of Señor Santa María, and in the latter capacity carried compulsory civil marriage and several other laws highly obnoxious to the clergy. In 1886 he was elected president; but, in spite of his great capacity, his imperious temper little fitted him for the post. He was soon irreconcilably at variance with the majority of the national representatives, and on the 1st of January 1891 he sought to terminate an intolerable situation by refusing to convolve the assembly and ordering the continued collection of the taxes on his own authority. This led to the Chilean Civil War of 1891, which ended in the overthrow of Balmaceda, who committed suicide on the 18th of September, the anniversary of his elevation to the presidency.

**BALMAIN**, a town of Cumberland county, N.S.W., Australia, on the western shore of Darling Harbour, Port Jackson, 2 m. by water from Sydney and suburban to it. Pop. (1901) 30,881. It is the home of great numbers of the working classes of New South Wales, and the largest factories and most important docks are situated here. There are scores of glass and stone works, shipbuilding yards and a coconut-oil factory in connexion with the soap-manufacture at Port Sunlight, England, are among the chief industrial establishments. Balmain became a municipality in 1860.

**BALMERINO, JAMES ELPHINSTONE, 1st Baron (c. 1553–1612)**, Scottish politician, was the third son of Robert, 3rd Lord Balmerino (d. 1620). Rising to power under James VI. he became a judge and a royal secretary; he accompanied the king to London in 1603 and was made Lord Balmerino, in 1604. In 1605 he became president of the court of session, but his ardour for the Roman Catholic religion brought about his overthrow. In 1599 on the king's behalf, but without the king's knowledge, he had sent a letter to Clement VIII. in which he addressed the pope in very cordial terms. A copy of this letter having been seen by Elizabeth, the English queen asked James for an explanation, whereupon both the king and the secretary declared it was a forgery. There the matter rested until 1608, when the existence of the letter was again referred to during negotiations between James and Cardinal Bellarmine. Interrogated afresh Balmerino admitted that he had written the compromising letter, that he had surreptitiously obtained the king's signature, and that afterwards he had added the full titles of the pope. In March 1609 he was tried, attainted and sentenced to death, but after a brief imprisonment he was released and he died at Balmerino in July 1612.

Balmerino's elder son John (d. 1649) was permitted to take his father's title in 1613. In 1634 he was imprisoned for his opposition to Charles I. in Scotland, and by a bare majority of the jury he was found guilty of "leasing-making" and was sentenced to death. But popular sympathy was strongly in his favour; the poet Drummond of Hawthorned and others interceded for him, and after much hesitation Charles pardoned him. Balmerino, however, did not desist from his opposition to the king. A chief among the Covenanters and a trusted counsellor of the marquess of Argyll, he presided over the celebrated parliament which met in Edinburgh in August 1641, and was one of the Scottish commissioners who visited England in 1644. He died in February 1649 and was succeeded as 3rd lord by his eldest son John. The title was in the female line through his cousin James the title of Lord Coupur. John's son John, 4th Lord Balmerino (1652–1736), was a lawyer of some repute and, although a sturdy opponent of the Union, was a Scottish representative peer in 1710 and 1713. John's son Arthur (1688–1746) who became 6th Lord Balmerino on the death of his half-brother John in January 1746, is famous as a Jacobite. He joined the partisans of James Edward, the Old Pretender, after the battle of Sheriffmuir in November 1715, and then lived for some time in exile, returning to Scotland in 1733 when his father had
secured him a pardon. He was one of the first to join Charles Edward in 1745; he marched with the Jacobites to Derby, fought at Falkirk and was captured at Culloden. Tried for treason in Westminster Hall he was found guilty, and was beheaded on the 11th of August 1746, behaving both at his trial and at his execution with great constancy and courage. On his death without issue his titles became extinct.

**Balmès, Jaime Luciano** (1810–1848), Spanish ecclesiastic, eminent as a political writer and a philosopher, was born at Vich in Catalonia, on the 28th of August 1810, and died there on the 9th of July 1848. Having attacked the regent Espartero and been exiled he founded and edited on his return the *El Pensamiento de la Nación*, a Catholic and Conservative weekly; but his fame rests principally on *El Protestantismo comparado con el Catolicismo en sus relaciones con la Civilización Europea* (3 vols., 1842–1844, 6th edition, 1879; Eng. trans. London, 1849), an able defence of Catholicism on the ground that it represents the spirit of obedience or order, as opposed to Protestantism, the spirit of revolt or anarchy. From the historical standpoint it is of little value. The best of his philosophical works, which are clear expositions of the scholastic system of thought, are the *Filosofía Filosófica* (4 vols., 1840, Eng. trans. by H. F. Brown, New York, 1856), and the *Curso de Filosofía Elemental* (4 vols., 1847), which he translated into Latin for use in seminaries.

**Balmoral Castle** (Gaelic, “the majestic dwelling”), a private residence of the Scotch sovereign, in the parish of Crathie and Braemar, Aberdeenshire, Scotland, on the right bank of the Dee (here spanned by a fine suspension bridge), 9 m. W. of Ballater, and at a height of 900 ft. above the sea. The property formerly belonged to the Farquharsons of Inverney, from whom it was acquired by Sir Robert Gordon, whose trustees disposed of the lease in 1848 to the prince consort, by whom the whole estate was purchased in 1852 and bequeathed to Queen Victoria. The castle is built of granite in the Scotch baronial style, with an eastern tower 100 ft. high commanding a superb view—Ballochbuie and Braemar to the W., Glen Gairn to the N., Lochnagar and the mountains of Dalmor to the E., and Craig Cowan (1319 ft.), a hill 1 m. to the south, have been erected memorial cairns to Queen Victoria, the prince consort, Princess Alice and other members of the royal family of Great Britain. The parish church of Crathie (1903), replacing the Kirk of 1806, is 1½ m. to the W., and about 2 m. farther west stands Aberdarg Castle, another Highland royal palace, an ancient building to which modern additions have been made, inhabited by King Edward VII. when prince of Wales, and after his accession to the throne used as a shooting-lodge.

**Balnaves, Henry** (1512–1579), Scottish politician and reformer, born at Kirkcaldy about 1512, was educated at St Andrews and on the continent, where he adopted Protestant views. Returning to Scotland, he continued his legal studies and in 1538 was appointed a lord of session. He married about the same time Christian Schives, and in 1539 was granted the estate of Halhill in Fife, after which he is generally named. Before 1540 he was sworn of James V’s. privy council, and was known as one of the party in favour of the English alliance and of an ecclesiastical reformation. He is also described as treasurer to James (Letters and Papers, 1543, i. 64), but the regent Arran appointed him secretary in the new government of the infant Queen Mary (January 1543). He promoted the act permitting the reading of the Scriptures in the vulgar tongue, and was one of the commissioners appointed to arrange a marriage treaty between the little queen and the future Edward VI. In London he was not considered so compliant as some of the other commissioners, and was not made privy to all the engagements taken by his colleagues (ib. i. 834). But Beton “loved him worst of all,” and, when Arran went over to the priestly party, Balnaves was, in November 1543, deprived of his offices and imprisoned in Blackness Castle.

Thence he was released by the arrival of Hertford’s fleet in the following May, and from this time he became a paid agent of the English cause in Scotland. He took no part in the murder of Beton, but was one of the most active defenders of the castle of St Andrews. He received £100 from Henry VIII. in December 1546, was granted an annuity of £125 by Protector Somerset in 1547 and was made English paymaster of the forces in St Andrews. When that castle surrendered to the French in July Balnaves was taken prisoner to Rouen. Somerset made vain efforts to procure his release and continued his pension. He made himself useful by giving information to the English government, and even Mary Tudor sent him £50 as reward in June 1554. Balnaves also busied himself in writing what Knox calls “a comfortable treatise of justification,” which was found in MS. with a preface by Knox, among the reformer’s papers, and was published at Edinburgh in 1584 under the title *The Confession of Faith*.

In 1557 Balnaves was permitted to return to Scotland and regain his property; probably it was thought that Mary Tudor’s burnings would have cooled the ardour of his English affections, and that in the war threatening between two Catholic countries, Balnaves would prove his worth. The accession of Queen Elizabeth changed the situation, and Mary of Guise had meantime been seeking him of “practices out of England” (Salisbury MSS. i. 155). He took, in fact, an active part in the rising of 1559 and was commissioned by the Congregation to solicit the help of the English government through Sir Ralph Sadleir at Berwick. He was also selected one of the Scots representatives to negotiate with the duke of Norfolk in February 1560. In 1563 he was restored to his office as lord of session, and was one of those appointed by the General Assembly to revise the *Book of Discipline*. He was one of Bothwell’s judges for the murder of Darnley in 1567, and in 1568 he accompanied Moray to the York inquiry into Queen Mary’s guilt. He resigned his judicial office in 1574, and died in 1579 at Edinburgh. He has been claimed as a Scots bard on the strength of one ballad, “G allandis all, I cry and call,” which is printed in Allan Ramsay’s *Elegrean* (2 vols. 1724–1727).

(A. F. P.)

**Balneotherapeutics** (Lat. *balnus*, a bath, and *Gr. θεραπεύειν*, to treat medically). The medical treatment of disease by internal and external use of mineral waters is quite distinct from “hydrotherapy,” or the therapeutic uses of pure water. But the term “balneotherapeutics” has gradually come to be applied to everything relating to spa treatment, including the drinking of waters and the use of hot baths and natural vapour baths, as well as of the various kinds of mud and sand used for hot applications. The principal constituents found in mineral waters are sodium, magnesium, calcium and iron, in combination with the acids to form chlorides, sulphates, sulphides and carbonates. Other substances occasionally present in sufficient quantity to exert a therapeutic influence are arsenic, lithium, potassium, manganese, bromine, iodine, &c. The chlorides in solution are oxygen, nitrogen, carbonic acid and sulphated hydrogen. Argon and helium occur in some of the “simple thermal” and “thermal sulphur waters.” There are few doctors who would deny the great value of special bathing and drinking cures in certain morbid conditions. In the employment of the various mineral waters, many of the spas adopt special means by which they increase or modify their influence, e.g. the so-called “aromatic” or “medicated” baths, in which substances are mixed to exert a special influence on the skin and peripheral nerves. Of these the “pine-needle” bath has the greatest repute; it is made by adding a decoction of the needles or young shoots of firs and pines. Fir wood oil (a mixture of etherial oils) or the tincture of an alcoholic extract acts equally well. The volatile ethereal constituents are supposed to penetrate the skin and to stimulate the cutaneous
circulation and peripheral nerves, being eliminated later by the ordinary channels. Similar effects follow the addition to the bath of aromatic herbs, such as camomile, thyme, &c. For a full-sized bath 1½ to 2 lb of herbs is tied in a muslin bag and infused in a gallon of boiling water; the juices are then expressed and the infusion added to the bath. Astringent baths are prepared in a similar way from decoctions of oak bark, walnut leaves, &c. In many spas on the European continent baths are prepared from peat or mud mixed with hot mineral water. Mineral peat consists of decomposing vegetable soil that has been so long in the neighbourhood of the medicinal spring that it has undergone peculiar and variable chemical changes. This is mixed with the hot mineral water until the bath has the desired consistency, the effect on the patient being in almost direct proportion to the density. These baths vary greatly in composition. Mud baths are chiefly prepared from muddy deposits found in the neighbourhood of the springs, as at St Amand. They act like a large poultice applied to the surface of the body, and in addition to the influence of the temperature, they exert a considerable mechanical effect. The pulse is accelerated some 6 to 12 beats a minute, the respiration number rises, and the patient is thrown into a profound perspiration. They have very great value in gouty and rheumatic conditions and in some of the special troubles of women.

There are certain conditions in which mineral water treatment is distinctly contra-indicated. Advanced cardiac disease and cardiac cases with failure of compensation must pre-eminently be treated at home, not at a spa. Advanced arterio-sclerosis, any form of serious organic visceral disease, advanced cirrhosis, pulmonary tuberculosis with a tendency to haemoptysis, much elevation of temperature or emaciation, are all entirely unsuited for this form of treatment. Serious organic nervous diseases, great nervous depression and old cases of paralysis are all contra-indicated. Any trouble, however suited in itself for spa treatment, must be considered inapplicable if complicated with phthisis or emaciation.

In advising balneotherapeutic treatment in any case, all the conditions and habits of the patient—pecunary, physical and psychic—must be considered, as the spa must be fitted to the patient, not the patient to the spa. Besides the particular disease, the idiosyncrasy of the patient must be considered, the same morbid condition in different people requiring very different treatment. Retarded convalescence is a condition often treated at the spas, although hygienic surroundings, both mental and physical, are usually all that is necessary to ensure complete recovery. After rheumatic fever, however, if the joints remain painful and the heart is dilated, the thermal gaseous saline water of Naunheim, augmented by Schott’s resistance movements, will often appear to work wonders. Chronic rheumatism, where there is much exudation round a joint or incipient stiffness of a joint, may be relieved by hot thermal treatment, especially when combined with various forms of massage and exercises. Simple thermal waters, hot sulphur springs and hot muriated waters are all successful in different cases. Chronic muscular rheumatism can also be benefited in a similar manner. Diseases of the nervous system are on the whole treated by these means with small success. Mental diseases other than very mild cases of depression should be considered inapplicable. Neuroathetoses are sometimes treated at chalybeate or thermal muriated saline spas; but such treatment is entirely secondary to the general management of the case. Neuralgic affections and the later stages of neuritis, especially when dependent on gout or rheumatism, are often relieved or cured. Abdominal obesity (abdominal plethora), a feature of obesity, glycousuria, &c., are extremely well fitted for this form of treatment. The alkaline sulphated waters, the bitter waters and the common salt waters can all be prescribed, and after a short course can be supplemented with various forms of active and passive exercises. Diseases of the respiratory organs are far more suited for climatic treatment than for treatment by baths. Anaemia can usually be better or equally well treated at home, or by seaside residence or a sea voyage, though many physicians prescribe chloride of sodium waters, followed by a course of iron waters at some suitably situated spa. In the anaemia dependent on malarial infection, the muriated or alkaline sulphated waters at spas of considerable elevation and combined with iron and arsenic are often very beneficial. Gravel and stone, if of the uric acid variety, can be treated with the alkaline waters, but the case must be under constant observation lest the urine become too alkaline and a deposition of phosphates take place on the already formed uric acid stone. Gout is so variable both in cause and effect that much discrimination is required in its treatment. Where the patient is of “full habit,” with portal stagnation, the sulphated alkaline or mild bitter waters are indicated, especially those of Carlsbad and Marienbad; but the use of these strong waters must be followed by a long rest under strict hygienic conditions. Where this is impossible, a milder course must be advised, as at Homburg, Kissingen, Harrogate, Wiesbaden, Baden-Baden, &c. For very delicate patients, and where time is limited, the simple thermal waters are preferable.

For radiant heat and light baths and electric baths of all kinds, see ELECTROTHERAPEUTICS; and for compressed air baths, AEROATHERAPEUTICS. (See also BATHS, THERAPEUTICS, and the articles on diseases.)

BALQUHIDDER (Gaelic, “the farm in the back-lying country”), a village and parish of Perthshire, Scotland, Pop. of parish (1901) 605. The village lies 2 m. W. of the station of the same name on the Caledonian railway from Callander to Oban, and 272 m. N.W. of Stirling. It is situated at the end of Loch Voil, a lake at the foot of the Braes of Balquhidder. The Maclaurins acquired the district as early as the 9th century and occupied it for several hundred years until ousted by the Macgregors, a neighbouring clan, who had repeatedly raided their lands, and in 1538 slew the chief and many of his followers. Balquhidder was the scene of some of the exploits of Rob Roy, who died there in 1754. His grave in the old kirkyard is marked by a stone ornamented with rude carving, executed probably by his own hands before his time. Another ancient stone is said traditionally to cover the grave of Angus, the Columbian missionary, who was the first to carry on Christian work in this part of the Highlands.

BALRAMPUR, a town of British India near the river Rapti, 28 m. from Gonda, in the Gonda district of the United Provinces. Pop. (1901) 16,723. It gives its name to one of the largest taluksdari estates in the province. The raja, Sir Drigbijai Singh K.C.S.I., was conspicuously loyal during the Mutiny, and was rewarded with accessions of territory and hereditary privileges. His death in 1882 gave rise to prolonged litigation and the estate was thrown into chancery. The income is estimated at £120,000, paying a revenue of £46,000. Numerous schools and hospitals are supported. Balrampur contains a large palace, a handsome modern temple and an Anglo-Vernacular school.

BALSAM (from Gr. βάλσαμος, through Lat. balsamum, contracted by popular use to O. Fr. bāme, mod. Fr. bāme; Eng. balm), a term properly limited to such resins or oleo-resins as contain benzoic acid or cinnamic acid or both. These balsams which conform to this definition make up a distinct class, allied to each other by their composition, properties and uses. Those found in commerce are the balsam of Peru, balsam of Tolu, liquid storax and liquidambar. Balsam of Peru is the produce of a lofty leguminous tree, Myroxylon Pereirae, growing within a limited area in San Salvador, Central America and introduced into Ceylon. It is a thick, viscid oleo-resin of a deep brown or black colour and a fragrant balsamic odour. It is used in perfumery. Though contained in the pharmacopeias it has no special medicinal virtues. Balsam of Tolu is produced from Myroxylon toluiferum. It is of a brown colour, thicker than Peru balsam, and attains a considerable degree of solidity on keeping. It also is a product of equatorial America, but is found over a much wider area than is the balsam of Peru. It is used in perfumery and as a constituent in cough syrups and lozenges. Liquid storax or storax preparatus, is a balsam yielded by Liquidambar orientalis, a native of Asia Minor. It is a soft resinous substance, with a pleasing balsamic odour, especially after it
has been kept for some time. It is used in medicine as an external application in some parasitic skin diseases, and internally as an expectorant. An analogous substance is derived from Liquidambar Allingia in Java. Liquidambar balsam is derived from Liquidambar stryaciflua, a tree found in the United States and Mexico. It contains cinamnic acid, but not benzoic acid.

Of so-called balsams, entirely destitute of cinamnic and benzoic constituents, the following are found in commerce:—Mecca balsam or Balm of Gilead, from Commiphora opobalsamum, a tree growing in Arabia and Abyssinia, supposed to be the balm of Scripture and the βαλασμος of Theophrastus. When fresh it is a viscous fluid, with a penetrating odour, but it solidifies with age. It was regarded with the utmost esteem among the nations of antiquity and to the present day it is peculiarly prized among the people of the East. For balsam of copaiba see Copaiba.

Under the name of wood oil, or Gurjun balsam, an oleo-resin is procured in India and the Eastern Archipelago from several species of Dipeirocrinus, chiefly D. turbinatus, which has the odour and properties of copaiba and has been used for various purposes. Wood oil is also used as a varnish in India and forms an excuse for the name. The balsam resin of the Canada balsam or Canada turpentine is the oleo-resin yielded by Abies balsamea, a tree that grows in Canada and the northern parts of the United States. It is a very transparent substance, somewhat fluid when first run, but thickening considerably with age, possessed of a delicate yellow colour and a mild terebinthous odour. It contains 24% of essential oil, 60% of resin soluble in alcohol, and 16% of resin soluble only in ether. Its chief uses are for mounting preparations for the microscope and as a cement for glass in optical work.

The garden balsam is an annual plant, Impatiens balsamina, and the balsam apple is the fruit of Momordica balsamina, nat. order Cucurbitaceae.

BALSAM, HUGH DE (d. 1260), English churchman, appears first as sub-prior of the monastery of Ely. On the death of William of Kilkenny in 1256 the monks elected him bishop of Ely, to the annoyance of Henry III. who had handed over the temporalities of the see to John de Waleran. The election was confirmed by the pope in 1257 and Hugh set to work to repair the damage done by the prior. In 1260 the bishop obtained a charter allowing him to replace the secular brethren residing in his hospital at St John at Cambridge by “studious scholars”; a second charter four years later entirely differentiated these scholars from the brethren of the hospital, and for them Hugh de Balsam founded and endowed the college of Peterhouse.

BALTA, a town in the Russian government of Podolia, between the Dniester and the Bug, 131 m. by rail N.N.W. of Odessa. It carries on a large trade in cattle, horses and grain, and has two annual fairs, held at Whitsuntide and in June. A variety of industries, such as tallow-melting, soap-boiling, tile-making and brewing, are carried on. The Jews form a very considerable part of the population, which in 1867 numbered 4,528, and in 1897, 23,353. Balta was in great part destroyed by the Russians in 1780.

BALTARD, LOUIS PIERRE (1764-1840), French architect and engraver, was born in Paris on the 9th of July 1764. He was originally a landscape painter, but in his travels through Italy he was so much struck with the beauty of the Italian buildings, that he changed his profession and devoted himself to architecture. In his new occupation he achieved great success, and was selected to prepare the plans for some of the largest public edifices in Paris. His reputation, however, is chiefly based on his great skill in engraving. Among the best known of his plates are the drawings of Paris (Paris et ses monuments, 2 vols. fol., 1803), the engravings for Denon’s Egypte, the illustrations of Napoleon’s wars (La Colonie de la grande armée), and those contained in the series entitled the Grand prix de l’architecture, which for some time he carried on alone. He also gained distinction as an engraver of portraits. Baltard died in Paris on the 22nd of January 1846.

Two of his children were also architects. Of these the more important was Victor Baltard (1805-1874), who was born in Paris on the 19th of June 1805. In 1803 he gained the prix de Rome at the Ecole des beaux-arts for designing a military school. He was largely instrumental in introducing a regular scheme of fresco decoration by modern artists in the churches of Paris, to take the place of the heterogeneous collections of pictures of all kinds with which their walls had been promiscuously decorated. He built many additions to existing churches, and also the church of St Augustin, in which he united the structural values of stone and steel. His most popular achievement was, however, the building of the central market in Paris. Victor Baltard also built the slaughter houses and the cattle market of La Villette. He died in Paris on the 13th of January 1874, after a life of great activity in his profession.

BALTIC SEA (Scand. and Ger. Ostsee; Russ. Балтийское Море), a sea extending between 54° and 66° N. lat., and 15° and 30° E. long., surrounded by the territories of Sweden, Russia, Germany and Denmark. Its greatest length is about 960 m.; greatest breadth about 400 m.; and length of coast-line, 3900 m.; the central axis runs approximately from south-west to north-east, and the Baltic is separated from the North Sea by the winding channel between the south of Scandinavia and the Cumbrian peninsula. This channel is usually included in the Baltic. The part of it west of a line joining the Skaw with Christiania fjord receives the name of Skagerrak; the part east of this line is called the Kattegat. At its southern end the Kattegat is blocked by the Danish islands, and it communicates with the Baltic proper by narrow channels called the Sound, the Great Belt and the Little Belt. The real physical boundary between the North Sea and the Baltic is formed by the plateau on which the islands Zealand, Fünen and Lolland are situated, and its prolongation from the islands Falster and Møen to the coasts of Mecklenburg and Rügen.

East of this plateau the Baltic proper forms a series of hollows or troughs. The first, or Bornholm deep, lies east of the Island of Bornholm, and is separated from the next, or Gotland deep, by the Middelbank. Beyond the Middelbank the Danziger Tiefe, an isolated depression, lies to the south-east, while to the north-east the Gotland basin, the largest and deepest of all, extends from Gotland to the Gulf of Finland. Along the Swedish coast a deep channel runs northwards from the Sound of the Sound of Öland; this is entirely cut off to the south and east by a bank which sweeps eastward and northward from near Karlshamn, and on which the island of Gotland stands, but it communicates at its northern end with the Gotland deep, and near the junction opposite Landsort is the deepest hole in the Baltic (430 metres = 130 fathoms).

An unbroken ridge, extending from Stockholm to Hangö in Finland, separates the Baltic basin proper from the depression between Sweden and the Åland Isles, to which the name Åland Haf has been given. North of the Åland Haf a ridge defines the southern edge of another depression, the Bothnian Sea, which in turn is separated from the most northerly division, the Gulf of Bothnia, by a ridge across the narrow Quarken or Kvarken Strait. The Gotland deep may be said to extend directly into the Gulf of Finland, an arm of the Baltic, running eastwards for about 250 m., and separating Finland from Estonia. Between Esthonia and Courland is the Gulf of Riga, a shallow inlet of roughly circular form, about 100 m. in diameter, and nowhere more than 27 fathoms deep.

According to recent computations the total area of the Baltic, including the Skagerrak and Kattegat, is 166,307 sq. m., and its volume 6007 cub. m., giving a mean depth of 36 fathoms, which is markedly less than that of any other arm of the sea of similar area.

In the deeper hollows in the south part of the Baltic the bottom consists almost invariably of either soft brown or grey mud or hard clay, while on the shallow banks and near the low coasts fine sand, of white, yellow or brown colour with small pebbles, is usually found.
BALTIC SEA

At the time of the last great subsidence, in glacial times, an arm of the sea extended across Sweden, submerging a great part of the littoral up to the Gulf of Bothnia, and including the present lakes Vener, Hjelmara, and Müla. During this late glacial period the Baltic was greatly reduced in area, and even the Baltic to become sufficiently salt for oysters to flourish. The subsequent upheaval restricted direct communication with the open sea to the Danish channels, and the Baltic waters became fresher; this depression of the Baltic was due to a number of fresh-water crustaceans, and even seals, became acclimatized. It has been suggested that the presence of the remains of these animals indicates a communication to the north with the Arctic Ocean; but in view of the low salinity of the water at this epoch shows a distinct change in the condition of the Baltic; and for this reason the Baltic to become sufficiently salt for oysters and does not form Cardium edule and Littorina littorea. At this time the Gulf of Bothnia must have suffered greater depression than the Baltic proper, for at the deposits of that epoch show a thickness of 25 to 30 metres (82 ft.) in the neighbourhood of Gotland. After this period of subsidence the process of elevation set in which gave the Baltic its present form and physical condition, and appears to be still in progress. Dr. R. Sieges has transferred the Baltic, or at least, the elevation for portions of Sweden and Finland; these indicate that the movement is now almost nil along the axial lines of the Baltic and the Gulf of Finland, but increases in amplitude northwards to the Gulf of Bothnia, and thus they of the front line of the Northern part of the Baltic against the Gulf of Bothnia. At Stockholm the rate of elevation is approximately 0.047 metre (=1.54 ft.) in a century.

The coast of the Baltic is rocky only in the island-studded region at the head of the Baltic basin proper—a submerged lake district—and the littoral generally is a typical morainic land, the work of the last great Baltic glacier. The southern margin of the Baltic is of peculiar interest. From Schleswig eastward to Livland, a considerable part of the coast is of morainic nature or Fährsten, the result of encroachment of the sea caused by subsidence. East of Lübeck, as far as the mouth of the Oder, these give place to Bodden, ramified openings studded with islands; the structure here composed of sand and clays, is believed to be of Danish origin, and is distinguished from both Denmark and Pomerania by an isthmus which was severed by tectonic movements. Beyond the Oder the coast-line is unbroken as far as the Gulf of Danzig. It is then cut into by the estuaries of the Vistula, the Elbe, and Neva, which have fertile plains, and the coast is rimmed by a continuous line of dunes, which cut off the two great lagoons of the Frisches Haff and Kursches Haff by sandspits or Nehrungen.

The average area of the Baltic is relatively large. According to the measurements of Sir J. Murray it extends to 461,450 sq. sea m. (=611,700 sq. English m.) The largest river-basin included in it is that of the Neva in the east, and next in size come the Vistula and Elbe; together these three drain a large area of the Baltic. This is distinct from the drainage of the Baltic, which is drained by the lagoons of the Baltic, and the coast, which form the drainage-system of Sweden and western Finland, are a remarkable feature.

Levellings from Swinemünde show that the mean level of the surface of the Baltic at that point is 26.7 metres (=830 ft.) below the surface of the North Sea at Amsterdam, and 0.066 metres (=216 ft.) below its level at Ostend. A line of levels from Swinemünde through Eger to the Adriatic showed the mean level of the Baltic to be 0.490 metres above that of the Adriatic Sea. The mean level of the surface of the Baltic rises about 0.5 metres (1.6 ft.) from the coast of Holstein to Memel, probably as a result of the prevailing westerly winds; this motion is reversed in the summer with the change of the movement of the waves of the Baltic are usually short and irregular, often dangerous to navigation. Destructive waves, probably caused by distant earthquakes, called Seiche is the term. Destructive waves, probably caused by distant earthquakes, called Seiche is the term.

The range of the tides is about one foot at Copenhagen; within the Baltic proper ordinary tides are scarcely perceptible. There is, however, a distinctly marked annual rise and fall due to melting and freezing of the ice; the freeze-up occurs in the spring (0.57 ft.), at Trave, and 3-9 cm. (0.46 ft.) at Swinemünde, the maximum occurring at the end of the summer rainy period in August.

The circulation of water in the Baltic proper must be considered apart from the circulation in the channels connecting it with the North Sea; and in this relation the plateau connecting the islands Falster and Møen with the coast of Mecklenburg and Rügen must be taken as the dividing line. In the great basins and hollows from Rügen to the Gulf of Bothnia and Finland the upper layers of water, from 30 to 70 metres (10 to 38 fathoms) in thickness, have almost the same salinity throughout. In these waters a vertical circulation is kept up by convection currents. Beneath these layers are masses of saltier water, through which a thermal wave of small amplitude is slowly propagated to the bottom by conduction. These strata are practically stagnant, deficient in oxygen and surcharged with organic acid. Their salinity is due to distillates of sea water and must therefore have passed over the plateau between Falster and Mecklenburg, but their horizontal extension is checked by the ridges separating the deep hollows in the Baltic from each other. The inflowing Baltic is a surface current, because it originates from a redundancy of fresh water.

The circulation in the channels connecting the Baltic proper with the North Sea is of a complex character. It is necessary in the first place to distinguish clearly between outflowing and inflowing waters; in practice this is easily done, as the outflowing water always contains less than 30 parts pro mille of salt, and the inflowing water more than 32 pro mille. The Baltic receives much more water by inflow than it loses by outflow, and on the other hand, only a small surplus must be got rid of by an outflowing current which may be named the "Baltic Stream." The following general laws may be laid down with regard to this:

1. That the Baltic Stream must be a surface current, because it originates from a redundancy of fresh water.

2. That, on account of the earth's rotation, the main part of the Baltic Stream must keep close to the coast of the Scandinavian peninsula.

3. That it must be a periodic stream, because the discharge of the rivers into the Baltic varies with the season of the year.

In spring and summer, and to a smaller extent in autumn, the Baltic is sufficiently abundant by inflow to safely maintain the outflow. But in winter the sources of the Baltic current are for the most part dried up by the freezing of the land water.

All the waters which enter the Skagerrak or Kattegat as undercurrents are actually of oceanic origin. They may be divided according to their origin and salinity as follows:

(a) Ocean water of 35 pro mille salinity or more.

(b) North Sea water, the predominant water in the North Sea area, of 32 to 34 pro mille.

(c) Bank water, 32 to 34 pro mille, which forms a broad edging of the coasts along the Baltic and North Sea.

The deepest water stratum in the Skagerrak is certainly of oceanic origin; it has been found to suffer changes of long period, and it is probably not always composed of water derived from the same part or the same depth of the North Atlantic; this water, is, as a rule, saltier than 35.5 pro mille, and has an elevated salinity, does not appear at the surface in the Skagerrak except as a strip along the coast of Jutland, but it is always found as an undercurrent overlying the oceanic water. It enters into all the deep-water channels of the Kattegat. The principal time of inflow of North Sea water is during spring and summer.

The bank-water of 32 to 34 pro mille salinity is found all along the coast of Jutland and Sweden. It is found in the south-east of the Baltic, and in the Kattegat. It therefore enters the Skagerrak either from the North Sea or from the north along the coast of Norway. It is probable that indeed an inflow of this water occurs from both directions—in August and September from the south, and in the late autumn and early spring (October) from the north, when the distribution of the waters is reversed. The bank-waters in different parts of the coast are too complex to be briefly explained; their relations to the times of occurrence of various fisheries of the region present many remarkable features, which have been investigated in recent years by the Swedish Commission.

On the west and south coasts of Sweden, and in the Skagerrak south-east of Norway, navigation is interfered with by ice only in a few places, and then the ice is usually drifting, compact sea-ice being very rare. Between Stockholm and Visby navigation usually ceases at the end of December and begins again about the 10th of April. During very severe winters the Aland Sea is covered with thick ice, but in ordinary winters the sea is only partly covered with ice, and is covered with ice every winter along the coasts, but rarely, if ever, in its central part. Navigation is interrupted by drifting ice from about the middle of November to the beginning of May, though the worst and most dangerous is believed to be between the 1st March and 1st April, which is called the "ice breaker." The northern part of the Gulf of Bothnia is frozen over in winter. In the Gulf of Finland the sea is usually frozen over, but navigation is rendered possible throughout the winter by the use of ice-breakers.

See references to different parts of the subject in the standard books on Geography and History. Among works on geography may be mentioned: A. Credner, Die Entstehung der Ostsee (Leipzig, 1895); G. de Geer, Om Skandinaviens midsförändringar under quartärperioden (Stockholm, 1888); R. Sieges, Seenenschwankungen und Strandveränderungen in Schwednien (Berlin, 1893); O. Petersson, "Review of Swedish Hydrographic Research," Scottish Geographical Magazine (1894); N. Ekelholm, Om klimatet ändringar i geologisk och historisk tid (Umeå, Stockholm, 1899); Publications of the International Council for the Study of the Sea (Copenhagen, since 1902).
BALTIMORE, GEORGE CALVERT, 1ST BARON (c. 1580–1632), English statesman, son of Leonard Calvert, and Alice, daughter of John Crossland of Crossland, was born at Kipling in Yorkshire and educated at Trinity College, Oxford. After travelling on the continent, he entered the public service as secretary to Robert Cecil, afterwards earl of Salisbury. In 1606 he was appointed clerk of the crown in Connaught and Clare, in 1608 a clerk of the council, and was returned to parliament for Bosseiney in 1609. He assisted James I. in his discourse against Vorstius, the Arminian theological professor of Leiden, and in 1613 took charge of the Spanish and Italian correspondence. The same year he was sent on a mission to Ireland to investigate grievances. For these services he was rewarded by knighthood in 1617, followed by a secretarieship of state in 1619 and a pension of £200 a year in 1620. He represented successively Yorkshire (1621) and Oxford University (1624) in the House of Commons, where it fell to him in his official capacity to communicate the king's policy and to obtain supplies. He was distrusted by the parliament, and was in favour of the unpopular alliance with Spain and the Spanish marriage. Shortly after the formation of the scheme he declared himself a Roman Catholic, and on the 12th of February 1625 threw up his office, when he was created Baron Baltimore of Baltimore and received a grant of large estates in Ireland. Henceforth he was seen less in the City of London and his attention was directed to the colonial enterprise, with which his name was always associated. He had established a small settlement in Newfoundland in 1621, for which under the name of Avalon he procured a charter in 1625, and which he himself visited in 1627. In consequence of disputes and the unsuitable nature of the climate he sailed thence for Virginia, but was forbidden to settle there unless he took the oaths of allegiance and supremacy. He returned home, and died on the 13th of April 1632 before a new concession was secured, the charter of Maryland passing the great seal on the 20th of June 1632 in favour of his son Cecilius, second Lord Baltimore, who founded the colony. Baltimore married Anne, daughter of George Myyne of Hurlingford, Hertfordshire, by whom he had six sons and five daughters. He wrote Carmen funebre in D. Hen. Untonam (1596); The Answer to Tom Tell-Troth... (1642) is also attributed to him, and Wood mentions Baltimore as having composed “something concerning Maryland.” His letters are to be found in various publications, including Stradford's Letters, Clarendon State Papers and the Calendars of State Papers.

Biog., with references there given; Wood's Athenae Oxonienses (Bliss) ii. 522; Doyle's, The English in America; Discourse on the Life and Character of Sir G. Calvert by J. P. Kennedy (1843), with the Review and the same; London Magazine, June 1768; "Sir G. Calvert," by L. W. WHILM (Maryland Hist. Soc., 1844); The Nation, vol. 70, p. 95; American Historical Review, vol. 5, p. 577.

BALTIMORE, a city and seaport, and the metropolis of Maryland, U.S.A., the 7th city in the population in the United States. It is at the head of tide-water on the Patapsco river and its middle and north-west branches where they form an estuary 12 m. from the entrance of their waters into Chesapeake Bay, in lat. 39° 17' N. and long. 76° 37' W., about 172 m. by water from the Atlantic Ocean, 40 m. by rail N.W. from Washington, 26 m. N. by W. from Annapolis, 97 m. S.W. from Philadelphia and 184 m. from New York. Pop. (1800) 434,439; (1820) 508,037 of whom 70,258 were negroes, and 68,606 foreign-born (of these 32,308 were natives of Germany, 10,403 of Russia, 9,609 of Ireland, 28,414 of England, 18,848 of Poland, 23,294 of Italy, 1,426 of Germany (exclusive) 558,856, served by the Baltimore & Ohio, the Philadelphia, Baltimore & Washington (the Pennsylvania system), the Baltimore & Annapolis Short Line, the Baltimore, Chesapeake & Atlantic; the Northern Central; the Western Maryland and the Maryland & Pennsylvania railways; and by steamship lines running directly to all the more important ports on the Atlantic coast of the United States, to ports in the West Indies and Brazil, to London, Liverpool, Southampton, Bristol, Leith, Glasgow, Dublin, Belfast, Havre, Antwerp, Rotterdam, Bremen, Hamburg and other European ports.

The city extends nearly 64 m. from E. to W., and except on the W. side a little more than 5 m. from N. to S., covering an area of about 32 sq. m. The ground on which it is built is for the most part gently rolling; originally some portions were swampy and others were marked by precipitous heights, but the swamps have been drained and filled and the heights rounded off. Jones's Falls, a small stream shut in between granite walls several feet in height, crosses the N. boundary line a short distance W. of its middle, flows S.E. to the S.E. corner of the main business quarter, and there meets the north-west branch of the Patapsco, in which lies the harbour, defended at its entrance by the historic Fort McHenry, built at the S.E. extremity of Locust Point, an irregular peninsula extending S.E., on which are grain-elevators and a number of wharves, including those of the Baltimore & Ohio railway.

That part of the city which lies E. of Jones's Falls is known as East Baltimore, and is in turn nominally divided into Fell's Point to the S. and E., now a shipbuilding and manufacturing quarter, and Old Town to the N. and W. In the Old Town still remain a few specimens of eighteenth century architecture, including several old-fashioned post-houses, which used to furnish entertainment for travellers starting for the Middle West by way of the old Cumberland Road beginning at Fort Cumberland and from Cambridge to Fort Mchenry or the turnpike. The more inviting portion of the modern city lies on the western side of Jones's Falls, and the principal residential districts are in the northern half of the city. A little S. from the centre of the city, Baltimore Street, running E. and W., and Charles Street, running N. and S., intersect; from this point buildings on these two streets are numbered N., S., E. and W., while buildings on other streets are numbered N. and S. from Baltimore Street and E. and W. from Charles Street. Baltimore Street is the chief business thoroughfare; S. of it as well as a little to the N. is the wholesale, financial and shipping district; while West Lexington Street, a short distance to the N., and North Howard and North Eutaw Streets, between Fayette and Franklin Streets, have numerous department and other retail stores. In North Gay Street also, which runs N.E. through East Baltimore, there are many small but busy retail shops. North Charles Street, running through the district in which the more wealthy citizens live, is itself lined with many of the most substantial and imposing residences in the city. Mount Vernon Place and Washington Place intersecting near the centre of the town, Eutaw Place farther N.W., and Broadway running N. and S. through the middle of East Baltimore, are good examples of wide streets, having squares in the middle, adorned with lawns, flower-beds and fountains.

The buildings of the principal business quarter have been erected since 1804, when a fire which broke out on Sunday the 7th of February destroyed all the old ones within an area of 150 acres. Within a year after the fire, however, 225 places of business were again occupied and 170 more were building. A city ordinance prohibited the erection of any building more than 185 ft. in height, and prescribed a uniform height for those in the same neighbourhood; a large portion of the new buildings are of either three or four stories, but a few tall ones range from ten to sixteen. The principal materials of which they are built are limestone, granite, marble and bricks, and terra-cotta of various colours.

The city hall, the post-office and the court-house, standing in a row, and each occupying a separate block along E. Fayette Street, in almost the exact centre of the city, are three of Baltimore's most imposing buildings, crowning them narrowly escaped destruction by the great fire. The city hall, completed in 1875, in the Renaissance style, consists of a centre structure of four storeys surmounted by an iron dome 260 ft. high, and two connecting wings of three storeys surmounted by a mansard roof; the entire outer facing is of white Maryland marble. The post-office, completed in 1890, is built of Maine granite. The court-house, completed in 1890, is of white marble, with mural paintings by La Farge, E. H. Blashfield and C. V. Turner. Two of the principal library buildings—the Peabody and the Enoch Pratt—
are faced with white marble. Among the churches may be
mentioned the Roman Catholic cathedral, supported by a dome
120 ft. high—Baltimore being the seat of a Roman Catholic
archbishopric, the highest in rank in the United States; the First
Presbyterian church (decorated Gothic), with a spire 390 ft.
high; the Grace Episcopal church—Baltimore being the seat of a
Protestant Episcopal bishopric; the First Methodist Episcopal
church; and the synagogues of the Baltimore Hebrew Congrega-
tion and the Oheb Shalom Congregation. Other notable build-
ings are the custom-house, the Masonic Temple, the Maryland
Clubhouse, the Mount Royal station of the Baltimore & Ohio railway,
and the buildings of the Johns Hopkins hospital. There are
several good bridges across Jones's Falls.

On an elevated site at the intersection of Washington Place—
a continuation of N. Charles Street—with Mount Vernon Place
stands a white marble monument in honour of George Washington,
the eldest of the monuments in his honour in the United States.
The corner-stone was laid in 1815 and the monument was
completed in 1829. The base is 50 ft. sq., and 24 ft. high; on the
tower (as a Doric column, 25 ft. in diameter at the base and
130 ft. high, which is surmounted by a statue of Washington 16 ft.
A winding stairway in the interior leads to a parapet at the
top. In the square by which the monument is surrounded
are also statues of George Peabody by W. W. Story (a replica
of the one in London), Roger Brooke Taney by W. H. Rinehart,
and John Eager Howard by Emmanuel Frémiet; and bronze
pieces representing Peace, War, Force and Order, and a figure
of a lion by Antoine L. Barye. The Henry Walters collection
of paintings, mostly by modern French artists, and of Chinese
and Japanese bronzes, ivory carvings, enamels, porcelain and
paintings is housed in the Walters Art Gallery at the S. end of
Washington Place; at the south-east corner of the square is the
Peabody Institute with its conservatory of music and
collection of rare books, of American paintings, and of casts,
including the Rinehart collection of the works of William
H. Rinehart who was a native of Maryland. In Monument
Square near the post-office and the court-house is the
white marble Battle Monument, erected in 1815 to the memory
of those who had fallen in defence of the city in the previous year;
it is 52 ft. high, the column being in the form of a bundle of
Roman fasces, upon the bands of which are inscribed the names
of those whom it commemorates; and the whole is surmounted
by a female figure, the emblematical genius of the city. To this
monument and the one in honour of Washington, Baltimore
owes the name "The Monumental City," frequently applied to
it. A small monument erected to the memory of Edgar Allan Poe
stands in the Westminster Presbyterian churchyard, where he
is buried; there is another monument to his memory in Druid
Hill Park. In Greenmount Cemetery in the north central part
of the city are the graves of Junius Brutus Booth, Mme Elizabeth
Patterson Bonaparte (1785–1879), the wife of Jerome Bonaparte,
Johns Hopkins, John McDonogh and Sidney Lanier.

In 1908 there were in the city under the jurisdiction of the
department of public parks and squares 13 parks of 10 acres
or more, 15 parks of 5 to 10 acres, and 52 parks of
2188 acres and of squares 80–53 acres. Chief among the parks
is Druid Hill Park in the N.W. containing 672-78 acres and
famous for its natural beauty. Clifton Park, of 312-26 acres,
2 m. E. of Druid Hill and formerly a part of the Johns
Hopkins estate, passed into the possession of the city in 1895.
Patterson Park in the extreme S.E., of 125-70 acres, is a favourite
resort for the inhabitants of East Baltimore.

Education.—Baltimore ranks high as an educational centre.
Johns Hopkins University (q.v.) is a leading institution of the
United States for graduate study. The Peabody Institute,
found in 1859 by George Peabody, who was for some years
a resident of Baltimore, is an important factor in the promotion
of science, literature and the fine arts. Goucher College (Meth-
odist, 1888) for women, is one of the best institutions of
the kind in southern United States. The older of the two state
normal schools, opened in 1857, is located here. Morgan
College (Methodist), opened in 1876, offers the advantages of a
college education to the coloured young people. Loyola College,
found in 1872, and various other institutions are for the
training of the Catholics.

The McDonogh farm school, about 12 m. N.W., with a farm
of 835 acres, a printing-office, and carpenter and machine shops
prepares poor boys to enter any college in the country. The
institution owes its origin to a bequest left by John McDonogh.
Among the professional schools are the university of Maryland
and Baltimore University—each of which offers courses in law,
medicine and dentistry—the Baltimore Medical College, the
College of Physicians and Surgeons, the Woman's Medical
College, the Baltimore College of Dental Surgery, the Maryland
College of Pharmacy (since 1904 part of the university of Mary-
land), the Baltimore Law School, St Joseph's Seminary and
St Mary's Seminary, which, established by the Society of St
Sulpice in 1791, is said to be the oldest Catholic theological
seminary in the United States. The city also has a Polytechnic
Institute, as well as high schools for white and for coloured
pupils. The principal libraries are those of Johns Hopkins
University, Peabody Institute, Maryland Historical Society,
and the Bar Association; and the Enoch Pratt, the New Mercantile,
and Maryland Diocesan (Protestant Episcopal).

The charitable institutions of Baltimore are numerous.
Several such institutions supported wholly or in part by the
state of Maryland (q.v.) are located here, and besides these
there are scores of others. A representative list includes:—
the Charity Organization Society, the primary object of which is
to organize the work of the others; the Baltimore Association
for the Improvement of the Condition of the Poor, which seeks
to discourage indiscriminate alms-giving; the Bay View asylum
or city poorhouse; the Children's Aid Society; the Thomas
Wilson Fuel-Saving Society, for furnishing coal at low rates;
the Woman's Industrial Exchange, for assisting women in need
to support themselves; Johns Hopkins hospital, noted for the
excellence of its equipment especially for heating and ventilating;
Saint Joseph's general hospital; hospital for the women of
Maryland of Baltimore city; nursery and child's hospital;
Baltimore eye, ear and throat charity hospital; Maryland
hospital for the insane; the Sheppard asylum, intended espe-
cially for the cure of the insane; the Sheppard and Enoch
Pratt hospital; the Baltimore orphan asylum; Saint Vincent's
infant asylum; the Thomas Wilson sanatorium for children,
intended for children under three years of age, who are suffering
from disease, during the warm summer months; the Free
Summer Excursion Society, for affording a change of air to the
indigent sick; home for the incurables; homes for the aged;
homes for friendless children; institutions for the blind; and
institutions for the deaf and dumb.

Water for the city taken from Jones's Falls and Gunpowder
river a few miles N. of the city limits, is brought through tunnels,
and is stored in eight reservoirs having an aggregate capacity of
2275 million gallons. The whole system is owned by the munici-
pality and can furnish about 300 million gallons daily. After the
first $60,000,000 was appropriated for a new sewage system
the city voted $1,000,000 in 1872. In 1875, the state
and legislature empowered the city to borrow $1,350,000 to establish a municipal lighting plant,
but in 1909 private concerns still supplied the streets with light.

Commerce.—The harbour, which consists of three parts, is
excellent. Its entrance at Fort McHenry is a channel 600 ft.
wide, with a minimum draft (1907) of 31 ft. of water.

The depth is continued with an increased width for a mile and
a quarter to near Fells' Point, where the width is contracted
one-fourth of a mile with a depth of 16 ft. Above this entrance
it widens into an ellipse a mile long, half a mile broad and
15 ft. deep. The third or inner harbour has a depth of 14 ft. and
pene-
trates far into the city. Vessels of the largest class can lie at the
Locust Point wharves and Canton, and vessels of 4000 tons can
use the inner harbour W. of the mouth of Jones's Falls.
By 1905
$5,000,000 had been appropriated since the great fire for new
docks. In 1908 the city ranked fourth among the Atlantic ports
of the United States in the amount of its exports ($92,113,496),
and fourth in the amount of its imports ($25,722,043).
That Baltimore has grown rapidly as a manufacturing city since 1880 is seen from the fact that in that year there were but 3683 manufacturing establishments, with a total annual product valued at $78,417,304, as compared with 6730 establishments (of which 2274 were under the factory system) in 1900 producing commodities valued at $161,249,280 ($135,107,626 under the factory system); in 1905 there were 2163 establishments under the factory system with a total annual product valued at $151,546,680, an increase of 12.2% in the five years. The city ranked eighth among the manufacturing centres of the United States, as regards the value of products, in the three successive censuses of 1880, 1890 and 1900. In 1905 it was ninth. Baltimore is noted particularly as the most important centre in the United States of the canning and preserving industry. The output in 1905 ($8,981,541) of the city's establishments for the canning and preserving of fruits and vegetables was 7.7% of that of the whole United States; in 1900 it had been 15% of the country's total. What seems to have been the first oyster-canning establishment in America was built in Baltimore (by a Thomas Kensett in 1820), and oyster-canning as a distinct industry on a permanent footing was begun here in 1830. The term "cove oysters," now applied to canned oysters everywhere, was originally applied to the oysters found in the coves on the W. side of the Chesapeake Bay, above the mouth of the Potomac. Up to 1880, after which year oyster canneries began to be built in the southern states, especially in Mississippi, Baltimore was the centre of the oyster-canning industry. Baltimore is also a well-known centre for the manufacture of clothing, in which in 1905 ($22,684,656) it ranked fourth among the cities of the United States; for cigar and cigarette-making (1905, $4,360,360); for the manufacture of foundry and machinery shop products (1905, $6,572,092), of tinware (1905, $5,705,980), of shirts (1905, $5,710,783), of cotton-duck (the output of sail-duck being about three-fourths of the total for the United States), bricks (about 150,000,000 annually), and fertilizers; it also manufactures furniture, malt liquors, and confectionery, and many other commodities in smaller amounts. The markets, especially the Lexington market, are noted for the abundance and great variety of their produce. The proximity of coal-mines, the abundance and variety of food supplies furnished by the state, the great quantity and variety of the city's manufactured goods, the excellent shipping facilities, and the consequent low cost of living, are prominent features of the physical life of the city.

Government.—Although the charter under which Baltimore is governed came into effect as late as 1858, it is only the second one for the city, the first one having been in force for 101 years. The mayor is now elected for a term of four years; he must be at least twenty-five years of age and must have property in the city to the value of $1000 or more. He shall have paid taxes for two years preceding his election. Great responsibility is centred upon him by giving him power to appoint the heads of departments and sub-departments, subject to the approval of the second branch of the council, and permitting him to remove at pleasure for six months after an appointment; in appointing a board or commission, however, he is required to choose the members from more than one political party. He has five days in which to veto an ordinance, and an affirmative vote of three-fourths of the members of each branch of the council is required to pass an ordinance over his veto. The council, constituting the legislative department, consists of two branches. The first branch is composed of one member from each ward, elected for a term of four years; the second branch of two members from each of four districts, and a president elected by the city at large, all for a term of four years; a property qualification is prescribed for members of each branch. All municipal officers are elected in May in order to separate municipal from state and national elections. No street franchise can be granted for a longer term than twenty-five years, and the right to regulate the exercise of each or every franchise is reserved to the mayor and council. A board of estimate, composed of the mayor, the city solicitor, the comptroller, the president of the second branch of the city council, and the president of the board of public improvements, has control over appropriations, the council having power to decrease the amount of any item but not to enlarge it. To create the idea of any branch except that of the mayor, the mayor and council must first obtain the consent of both the state legislature and the city electorate. The department of education is intrusted to an unalarmed board of nine commissioners, appointed by the mayor with the approval of the second branch of the council for a term of six years, three retiring every two years. This board appoints a superintendent, six or more assistant superintendents, and the teachers of the high schools and the Polytechnic Institute, also the other teachers, but only according to the superintendent's recommendation on the basis of merit.

History.—Baltimore was named in honour of the Lords Baltimore, the founders of the province of Maryland, but no settlement was made here until nearly 100 years after the planting of the colony; meanwhile at least two other townsites, on which it was hoped permanent towns might be established, had received the same name, but nothing came of either. Finally, however, while the provincial legislature was still engaged in the practice of directing places to be laid out for towns, where, as events proved there was nothing to give these towns more than a mere paper existence, that body in 1720 directed seven commissioners to purchase 60 acres of land on the N. side of the Patapsco and lay it out in sixty equal lots as the town of Baltimore. Three years later, at the instance of the same body, Jones-Town (Old Town) was laid out on the opposite side of Jones's Falls, and in 1745 these two towns were consolidated. About the same time the resources of the interior, for which Baltimore was to become a trade centre, were being rapidly developed by the Germans. Prior to 1753, in which year there were only twenty-five houses with two hundred inhabitants, the growth of the city had indeed been slow; but only a year or two later wheat loaded in its harbour was for the first time shipped to Scotland; during the war between the French and the English at this time some of the unfortunate Acadians found new homes here; in 1767 Baltimore was made the county seat; by the beginning of the War of Independence its population had grown to 6755; and in 1780 it was made a port of entry. The city early became an important shipping centre; during both the War of Independence and the War of 1812 many privates were sent out from it, and in the interval between these wars, the ship-owners of Baltimore had their share in the world's carrying trade, the "Baltimore clippers" becoming famous. In 1797 Baltimore received its first charter, having been governed until then from Annapolis and through commissions with very limited powers; at the surrender of the Fells' Point settlement, founded about 1730 by William Fell, a ship carpenter, was annexed. During the War of Independence, the Continental Congress, frightened from Philadelphia in 1776, sat for several weeks in a hall in W. Baltimore Street near Liberty Street; during the same war also fortifications were first erected on the site of the present Fort M'Henry. This fort effectively protected the city in 1814 when attacked by the British, and it was during that attack that Francis Scott Key, detained on one of the British attacking vessels, composed the "Star Spangled Banner." In 1860 all three of the candidates opposed to Lincoln—Douglas, Breckinridge and Bell—were nominated here, and here in 1864 President Lincoln was nominated for a second term. The city has been the meeting-place of other important conventions, and is sometimes called "The Convention City." At the outbreak of the Civil War on the 10th of April 1861, the Sixth Massachusetts regiment, while passing through Baltimore, was attacked by a mob and several men were killed on both sides; in the following month the city was subjected to military rule and so continued until the close of the war. From 1856 to 1860 Baltimore was under the control of the American or Know-Nothing party, and suffered greatly from election riots and other disorders, until as a remedy the control of the police system was taken from the mayor and council and exercised by the state government. Soon after the Civil War a Democratic "machine" got firm control of the city.
and although a struggle to overthrow the machine was begun in earnest in 1875 by a coalition of the reform element of the Democratic party with the Republicans, the struggle continued till 1880 that the coalition won its first decisive victory at the polls. Even then the efforts of the Republican mayor were at first thwarted by the council, which passed an ordinance over his veto, taking from him the power of appointment and vesting it in themselves; the Maryland court of appeals, however, soon decided that the council had exceeded its powers, and an important outcome of the reform movement was the new charter of 1898. Annexations of suburban territory in 1888 and 1890 greatly increased the area of the city.

BALzar, thomas (c. 1650–1663), German violinist, was born at Liibeck. He visited England in 1656 and made a great impression on Evelyn and Anthony Wood. In 1661 he was appointed leader of the king's famous band of twenty-four violins, but his intemperate habits cut short his career within two years. Like his violin-playing had ever been heard in England before, and in all probability the instrumental music of Henry Purcell owes much to its influence.

BA-Luba, a Bantu negroid race with several subdivisions; one of the most important and cultivated peoples of Central Africa. They are distributed over eight degrees of longitude between Lakes Tanganyika, Mweru and Bangweulu in the east, and the Kasai in the west. In the east, where they are found in the greatest racial purity, they founded the states of Katanga, Urea and Uguha; in the west they have intermingled to some extent with the Ba-Kete aborigines, whom they have partially dispossessed, dividing them into two portions, one to the north, the other to the south. To the western Ba-Luba the name Ba-Shilange has been given. With the Ba-Luba are connected the founders of the great Lunda empire—now divided between Belgian Congo and Angola—ruled by a monarch entitled Muuta Yanvo (Jamvo). The westward movement of the Ba-Luba took place in comparatively recent times, the end of the 18th century or the beginning of the 19th. Shortly afterwards a chief named Kwalaleye subjugated a large state. There followed in 1780 a remarkable politico-religious revolution, the result of which was the establishment of a cult of hemp-smoking, connected with a secret society termed Bena Riama; the members of this abandoned their old fetish worship and adopted a form of communism of which the central idea was the blood-brotherhood of all the members. Towards the east hemp-smoking becomes less common.

The Ba-Luba practise circumcision and scar-tattooing is common; tooth-filing is very frequent in the east, though in the west it is comparatively rare; the fashion of dressing the hair is very varied and often extremely fantastic. Their houses, which are built by the women, are rectangular; on the Lulus, however, pile-houses, square in shape, are found. They are an agricultural people, but work in the fields is relegated to the women and slaves; the men are admirable craftsmen and are renowned for their wood-carving, cloth-weaving and iron-work. In the west, bows and arrows are the chief weapons, in the east spears principally are used. The old form of religion still obtains in the most remote parts, but the communicism movement mentioned, and charms of all sorts, as well as carved faunoid and morphic figures, are extremely common. The Ba-Luba are a fine race physically and seem very prosperous, though in the extreme west considerable deterioration, physical, moral and cultural, has taken place.

Baluchistan, a country within the borders of British India which, like Afghanistan, derives its name from its dominant race of inhabitants. It extends from the Gomal river to the Arabian Sea, and from the borders of Persia and Afghanistan to those of the Punjab and Sind. It is divided into two major divisions, British Baluchistan, which is a portion of British India under the chief commissioner, and the foreign territories under the administration or supervision of the same officer as agent to the governor-general. The former portion, with an area of 2403 sq. m., consists principally of tracts ceded to the British government by Afghanistan under the treaty of Gandamak (1879), and formally declared to be part of British India in 1887. The second class comprises three subdivisions, namely areas directly administered, native states and tribal areas. The directly-administered districts include areas acquired in various ways. Some portions are held on lease from the khan of Kalat; while others are tribal areas in which it has been decided for various reasons that revenue shall be taken. They include the whole of the Zhob and Chagai political agencies, the eastern portion of the Quetta tahsil and other tracts, among which may be mentioned the Bolan Pass, comprising 18401 sq. m. in all. The whole of the northern boundary, with the north-eastern corner and the railway which traverses Baluchistan through Quetta up to New Chaman on the Afghan-Baluch frontier, is therefore in one form or other under direct British control. The remainder of the territory (79382 sq. m.) belongs to the native states of Kalat (including Makran and Kharan) and Las Bela. Tribal areas, in the possession of the Marri and Bugti tribes, are 1748 sq. m.

Baluchistan as a whole is a sparsely populated tract covering a larger area than any Indian province save Burma, Madras and Bengal. Three hundred miles of its mountain walls facing the Indus are south of the railway from the Indus to Quetta, and about 250 north of it. The railway with the passes and plains about it, and the dominant hills which surround Quetta, divide Baluchistan into two distinct parts. North of the railway line, hedged in between Afghanistan and the plains of the Indus, stretch the long ridges of rough but picturesque highlands, which embrace the central ranges of the Suliman system (the prehistoric home of the Pathan highlander), where vegetation is often sparse, and the climate clear and bracing and subject to no great extremes of temperature. The average breadth of this northern Pathan district is 150 m., but it narrows to less than 100 m. on the line of the Gomal, and expands to more than 200 m. on the line of the railway. Here all the main drainage either runs northwards to the Gomal, passing through the uplands that lie west of the Suliman Range; or it gathers locally in narrow lateral valleys at the back of these mountains and then bursts directly eastwards on the plains of the Indus by the shortest transverse route. South of the railway lies a square block of territory, measuring roughly 300 m. by 300, primarily the home of the Brahui and the Baluch; but within that block are included almost every conceivable phase of climate and representatives of half the great races of Asia. Here, throughout the elevated highlands of the Kalat plateau which are called Jalawan, the drainage gathers into channels which cut deep gorges in the hills, and passes eastwards into the plains of Sind. Beyond and south of the hydrographical area of the Jalawan highlands the rivers and streams of the hills either run in long straight lines to the Arabian Sea, north of Karachi, or, curving gradually westwards, they disappear in the inland swamps which form so prominent a feature in this part of south-west Asia. A narrow width of the coast districts collects its waters for discharge into the Arabian Sea direct. This section includes Makran. Baluchistan thus becomes naturally divided into two districts, north and south, by an intervening space which contains the Sind-Pishin railway. This intervening space comprises the region of the Ganges which, having burst its channel in the mountains, and, above it, the central uplands which figure on the map as "British Baluchistan"—where lies Quetta. All Baluchistan has now been surveyed. From the great Indo-Ganges series of triangles bases have been selected at intervals which have supported minor chains of triangulation reaching into the heart of the country. These again have been connected by links of more or less regularity, so that, if the Baluchistan triangulation lacks the rigid accuracy of a"
class" system, it at least supports good topography on geographical scales.

From Domandhi, at the junction of the Gomal and Kundar rivers, the boundless Baluchistan and Afghanistan follows the river valleys of the Gomal and Kundar, which, after leaving the indus valley, then leaves the river and diverges northwards, so as to include a section of the plain country stretching away towards lake Ab-i-Istada, before returning to the skirts of the hills. After a little time, the roads give place to a more open country, namely to the Chadma, or Chadma Range, passing over the northern spur of the Toba plateau (the base of the Anam (Kokaj) Range, and winds through the open plains west of the Kokaj. Here, however, the boundary does not follow the river. It confines the western edge of the Toba plateau (8,000 ft. high and 15 miles wide), the little river at the foot of this range. It then descends to the plains, returns again to the hills 40 m. south of Chaman, and thenceforward is defined by hill ranges southwards to Nushki. The eastern boundary of this northern section of the Baluchistan plateau is formed by the remnants of the Patans (Wazirs, Afridis, &c.) who live north of it. It is true that the Indian government interferes with as little as possible the internal jurisdiction of the tribal chiefs amongst the Patans of the Sullivan system as they do with that of the northern chiefs; but the occupation of a line of posts on the Zendar highway, which runs along the range almost from end to end on the west, places the doors of communication with Afghanistan in British hands, and gives command of their hills. It is thus maintained that peace and security exist on the southern frontier to a degree that does not exist in the north.

The central range of the Sullum hills is the dominant feature in the geography of northern Baluchistan. The central line or axis of the range lies a little east of the median of 70° E., and it is geologically composed of one or more great folds of the Cretaceous series. Towards the northern extremity of the range occurs a group of peaks, which together form an oblong block or "massif" amongst the most remarkable objects in the Sullum system (the whole of which is formed of the Crandatean and sea-level), bounded on its eastern and western edges by high, rugged, and steep parallel ridges. The western range culminates on the north in the peak of Kaisargagh (11,300 ft.), and in the eastern in a block or detached mass of sandstone and limestone near the mouth of the Ghulane, or "Gat" on the north, and of the Dhan in the south. These two channels carry the rush of mountain streams from the southern slopes of the massif right across the axis of the mountains and through the valleys to the plain below. The eastern ridge is that of the Indus. The plateau is covered with a fairly thick growth of the chilghosa or "edible" pine, and a sprinkling of juniper, on the higher slopes. It was ascended and surveyed for the first time in 1883.

Kaisargagh, the westernmost, and the Karda Range, the easternmost, which are all mentioned in the gazetteer, contain all the stages of geological evolution: the sandstone, the conglomerate, the limestone, the granite, the sandstone, the conglomerate, the limestone, the granite. The Karda Range is the only range in the system which practically embraces the whole width of northern Baluchistan. Westwards, looking towards Afghanistan, line upon line of broken jagged ridges and ranges, folds in the Cretaceous series overlaid by coarse sandstones and shales, follow each other in order, preserving their approximate parallelism until they touch the borders of Baluchistan. Immediately on the west of the Kaisargagh there towers the Shingar Mountain, a geological repetition of the Kaisargagh ridge, black with pines towards the summit and crowned by a great slab of rock; from which the river of the same name was said to have invited his Indian tribe to gaze upon for the last time, as they rested on the crags of the southern buttress of the Takht—where his shrine exists to this day. To that shrine thousands of Baluch pilgrims every year make a pious pilgrimage, in spite of its dangerous approach. All this country, so far, is independent Baluchistan within the jurisdiction of the Baluchistan Agency, with the exception of certain clans of the Shalor in the western part of the range. The easternmost of these, the Vihowa, who are under the North-West Frontier Province administration.

The climate of the Sullum range is, on the whole, dry and healthy, though the mountains are usually covered with snow during the winter months. The summer months are hot and dry, except on the mountain tops. The winter months are cool and dry, except on the mountain tops.

The central range of the Sullum hills is the dominant feature in the geography of northern Baluchistan. The central line or axis of the range lies a little east of the median of 70° E., and it is geologically composed of one or more great folds of the Cretaceous series. Immediately on the west of the Kaisargagh there towers the Shingar Mountain, a geological repetition of the Kaisargagh ridge, black with pines towards the summit and crowned by a great slab of rock; from which the river of the same name was said to have invited his Indian tribe to gaze upon for the last time, as they rested on the crags of the southern buttress of the Takht—where his shrine exists to this day. To that shrine thousands of Baluch pilgrims every year make a pious pilgrimage, in spite of its dangerous approach. All this country, so far, is independent Baluchistan within the jurisdiction of the Baluchistan Agency, with the exception of certain clans of the Shalor in the western part of the range. The easternmost of these, the Vihowa, who are under the North-West Frontier Province administration.
distance from Quetta. No part of Baluchistan is beyond the reach of the political officer, but there are many parts where he is not seen. The climate of British Baluchistan is dry and bracing—even exhilarating—but the extremes of temperature lead to the development of fever in very severe forms. On the whole it is favourable to European existence.

South-west of the dividing railway lies the great block of Southern Baluchistan. Within this area the drainage generally trends south-west to north-east, or towards the coast. The Lora swamps of Lora and Mashkel. The Hab river, which forms the boundary west of Karachi; the Purali (the ancient Arabus), which drains the low-lying flats of Las Bela; the Hingol (the ancient Tombo) of the Dush, which drain Makran, all form continuous streams, draining into the Arabian Sea and forming important arteries in the network of internal communication. An exception to the general rule is found in the Mulla, which carries the floods of the Kalat highlands into the Gandava basin and forms one of the easternmost of the line of high watercourses. In the cantonment of Kandahar. The fortress of Kalat is situated about midway between the sources of the Bolan and the Mulla, near a small tributary of the Lora (the river of Fishin and Quetta), about 6800 ft. above sea-level, can the westernmost part of this elevated plain in the very middle of the (See Kalat). To the north are the long sweeping lines of the Sarawan ridges, enclosing narrow fertile valleys, and passing away to the south-west to the edge of the Kharan desert. East and south are the rugged and broken hills of the Malwa; is the northern part of the Mulla, which forms a long break in the plateau. From these ridges, they run from valley to valley with easy grades. Kalat is the "hub" or centre, from which radiate the Bolan, the Mulla and the southern Lora affluents; but the Lora drains also the Purali and the Hingol south to the city of Quetta, and southwards into the desert to lose themselves in the desert and swamps to the west of Nushki, on the road to Seistan. Sixty miles south of Kalat, and beyond the Mulla sources, commences another remarkable hydrographic system, of the desert and the south-west basin of the Arabian Sea. To the west lies the basin desert, with intermittent river channels enclosed and often lost in sand-waves ere they reach the Mashkel swamps on the far borders of Persia. To the south-west are the long sweeping valleys of the Rakshan and Panijar, which, cutting north-eastward, divide the larger forest belt of the Makran. Directly south are the beginnings of the meridional arteries, the Hab, the Purali and the Hingol, which end in the Arabian Sea, leaving a space of mountainous seaboard (Makran) south of the Panijar and the surrounding Lora (watered at all) by the long lateral Kej river and several smaller mountain streams. Thus southern Baluchistan comprises four hydrographical sections. First is the long extension from Kalat, southwards and south-westwards of the Makran mountains, the Mulla rises, in the desert of Sind, the foot of which forms the Indian frontier. This is the land of the Brahui, and the flat wall of its frontier limestone barrier is one of the most remarkable features in the configuration of Persia. Directly south of the Brahui wall is the desert of Makran, the sea near Karachi the Hab river is the boundary of Sind, and here, across the enclosing desolation of outcropping ridges and intervening sand, a road may be found into Makran. But from the point of view of inspection of the region, it is most interesting the bed of sand which a road does not break occurs (save one) in 150 m. of solid rock wall, rising thousands of feet straight from the sandy plain. The one break, or gorge, which allows the Kow waters to pass, only forms a local intrenchment of the great extent of the desert, and the west of this mountain wilderness, stretching upwards from the sea in a wedge form between the Brahui highlands and the group of towering peaks which enclose the Hingol river and abut on the sea at Malan, are the alluvial flats and the sand hills of the Purali, foror the little known region of the Lora Bel of the Birgand of the Behar. In this hot and thirsty corner of Baluchistan, ruled by the Jam or Chram, there is a fairly wide stretch of cultivation, nourished by the alluvial detritus of the Purali and well irrigated. In a little garden to the south of the Hab and Purali, to the south of Beluchistan, and to the north of Beluchistan, is the capital of Sir Robert Sandeman, who spent the best part of an energetic and active life in the making of Baluchistan.

The boundary between Baluchistan and Afghanistan, starting from the north of Nushki, between the lines of Chagai to Baluchistan, and from this point to the boundary of Kabul, has been passed for a line of desert route between Nushki and Seistan, which is open in all ordinary seasons, to the south, and this route has been very developed, posts or semi have been established at intervals and wells have been dug. There is already a promisingAbad traffic, along it the railway has been extended from Quetta to Nushki.

**Geology.**—The mountain ranges of Baluchistan consist chiefly of Cretaceous and Tertiary beds, which are thrown into a series of folds running approximately parallel to the mountain ridges. The folds are part of an extensive system arranged as if in a festoon hanging towards the Peshawar and Mount Ararat. However, in the outer folds looped up at Sibi so as to form the subsidiary festoon of the Sulaiman and Bugti Hills. Outside the folds lie the horizontal deposits of the Makran coast, and within them lies the stony desert of Makran. The Hammer, which is the stony desert between the mountain ridges the beds are said to be but little disturbed.

Besides the Cretaceous and Tertiary beds, Jurassic rocks are known to take a considerable part in the formation of the hills of British Baluchistan. Triassic beds lie along the south side of the upper Zeb, and Fusa limestone has also been found there. With the exception of the later Tertiary beds the deposits are mostly marine. But in the upper Cretaceous and lower Tertiary, especially in north-western Baluchistan, there is an extensive development of volcanic tuffs and conglomerates, which on the whole are barren of fauna. These volcanic rocks occur in the Kalat, and the Sabgah ranges, and are important in the formation of the Deccan Traps of India. Great masses of syenite and diorite were intruded during the Tertiary period, and within the curve of the folded belt a line of recent volcanic cones stretches from Hingol (1904), E. Vredenburg, "A Geological Sketch of the Baluchistan Desert, and part of Eastern Persia," *Mem. Geol. Surv. India*, vol. xxxi, pt. 2, p. 315 (1883).

**Race.**—Within the Baluchistan half of the desert are to be found scattered tribes of nomads, called Rekis (or desert people), the Mohamadani being the most numerous. They are probably of Arab origin. This central desert is the Kir, Kej, Katch or Kas Kaian of Arabic medieval geography and a part of the ancient Kakani kingdom; the prefix Kej or Katch always denoting low-level flats or valleys, in contradistinction to mountains or hills. The Mohamadani nomads occupy the central mountain region, to the south of which lie the Masakhel and Khanar deserts inhabited by a people of quite different origin, who possess something approaching to historical records. These are the Naushirwanis, a purely Persian race, who have passed into Baluchistan within historic times, although the exact date is uncertain. The Naushirwanis appear to be identical with the Tahuki or Tukhani who are found in Perso Baluchistan. (A place Taqoo is mentioned by Nearcux, by Strabo and by Ptolomy.) They are a fine many race of people, in many respects superior to their modern compatriots, and the region of the Khanar desert and Masakhel, and the fish-eating population of the Baluchistan desert, is inhabited by a people of quite different origin, who possess something approaching to historical records. Equally scattered through the whole country, and almost everywhere recognizable, is the population of the Baluchistan desert, and the Kakani or Tukhani, which is sometimes represented by a locally dominant tribe, but more frequently by the agricultural slave and bondman of the general community. Such are the Daschwar and the Durzas (Herod. i. 129), who extend all through Makran, and, as slaves, are called Nakhis. The Turks have naturally left their mark strongly impressed on the ethnography of Baluchistan. All tribes claim to be of Arab origin and of Karkash extraction. As the Turks occupied all the southern Baluchistan and Seistan from a very early date, and finally spread through the Sind valley, where they remained till the 12th century, their genealogical records have become much obscured and it is probable that there is not
now a pure Arab in the country. It is as builders or engineers that they have established their most permanent records, Makran being full of the relics of their irrigation works and communications. The times when the climatic conditions of Baluchistan must have been very different from what they are now. Lower Sind also contains a great wealth of architectural remains, which may be found to the west of the Indus as well as in the delta. One particular tribe (the Kalmats), who left their name on the Makran coast and subsequently dominated Bela and Sind, west of the Indus, for a considerable period, exhibit great power of artistic design in their sepulchral monuments. The Dravidian races (Brahuis), who are chiefly represented by the Kambaranis and Mongals or Mongals (the latter are doubtless of Tartar origin), spread through southern Baluchistan as well as the eastern hills, and are scattered irregularly through the mountain tracts south of Kharan. The ancient Orteae mentioned by Arrian are probably represented by the tribe of Hot, who, as original masters of the soil, are exempt from taxation. The name Brahui is (according to Bellew) but a corruption of Ba-rohi (or "hillmen") in a language derived from Sanskrit which would represent the same term by Parva-ka. So that the Pahadous (Herod. iii. 92) may be recognized as surviving in the Brahui, and in the name (Parkan) of a mountain-bred stream which is a tributary of the Hingol. Amongst the kinds of sheep reference is made by Sir Lindsay to a tribe very early writers are the Bolodi, who give their name to the Bolda valley, a tributary of the Kej. The Bolodi were once the ruling race of southern Baluchistan, which was originally called Boledistan, and it seems possible that this may be the real origin of the much-disputed name of the country generally. Bola was an Assyrian term for Bael or Bel, the god of the Phoenicians and Druids. The Bolodi ruling family were in 1906 represented by but one living member, a lady, who was a government pensioner. The fast-diminishing Sajdis (Sajitiae) and Saka (Sacae) are others of the more ancient races of Baluchistan easily recognizable in classical geography. Most recent of all are the Gitchkis. The Gitchkis derive from a Rajput adventurer who flourished in the early part of the 17th century. They are now the dominant race in Panjgor and Kej, from whence they ousted the Bolodi. For three generations they remained Hindus; since then there has arisen amongst them a strange new sect called Zikari, with exceedingly loose notions of morality. The sect, however, appears to be fast merging into orthodox Mahomedanism. The indigenous civilization of that of the Gadaras. According to Tate the Gadaras are now represented by Sidi half-castes—those Makrani "boys" who are so well known in the mercantile marine as stokers and firemen. It seems unlikely that this modern admixture of Asiatic and African blood represents the "Asiatic Ethiopian" of Herodotus, which was more probably a direct connexion of the Himyaritic Arab builders of "bands" and revetments which spread eastwards from Arabia. Bellows finds in the Gadara the Garuda (eagles) of Sanskrit, who were ever in opposition to the Naga (snakes) of Scythic origin. Southern Baluchistan affords a most interesting field for the ethnographer. It has never yet been thoroughly explored in the interests of ethnographical science. The Baluch character is influenced by its environment as much as by its origin, so that it is impossible to select any one section of the general community as affording a satisfactory sample of popular Baluch idiosyncrasies. They are not a homogeneous race. Peoples of Arab extraction intermixed with people of Dravidian and Persian stock are all found together by the name of Baluch. The Makrani, Bael, and Bolodi tribes, who occupy the most southerly buttresses of the Suliman Mountains, are Rind Baluchis, almost certainly of Arab extraction. They came to Sind either with the Arab conquerors or after them, and remained there mixed up with the original Hindu inhabitants. The Arab type of Baluch extends through the whole country at intervals, and includes all the finest and best of Baluch humanity. Taking the Rind Baluch as the type opposed to the Afiridi Pathan, the Baluch is easier to deal with and to control than the Pathan owing to his tribal organization and his freedom from bigoted fanaticism or blind allegiance to his chief. The Baluch is less turbulent, less treacherous, less bloodthirsty and less fanatical than the Pathan. His idea of the man of worth and win, than that of his neighbour to the north, though generations have given him too a bold and manly bearing. It would be difficult to match the stately dignity and imposing presence of a Baluch chief of the Marri or Bugti clans. His Semitic features are those of the Bedouin and he carries himself as straight and as lofty as any Arab gentleman. Frank and open in his manners, fairly truthful, faithful to his word, temperate and enduring, and looking upon courage as the highest virtue, the true Baluch of the Derajat is a pleasant man to have dealings with. As a revenue payer he is not so satisfactory, his want of industry and the pride which looks upon manual labour as degrading making him but a poor husbandman. He is an expert rider; horse-racing is his national amusement, and the Baluch breed of horses is celebrated throughout northern India. Like the Pathan he is a bandit by tradition and descent and makes a first-rate fighting man, but he rarely enlists in the Indian army. He is nominally a Mahommedan, but is neglectful of the practices of his religion. The relations of the modern Baluch with the government of India were entirely transformed by the life work of Sir Robert Saleman, (q.v.).

The geographical position of Great Britain in Baluchistan is a very important factor in the problem of maintaining order and good administration in the country. The ever-restless Pathan tribes of the Suliman hills are held in check by the occupation of the Zhob valley; whilst the central domain position at Quetta safeguards the peace and security of Kalat, and of the wildest of the Baluch hills occupied by the Marris and Bugtis, no less than it bars the way to an advance upon India by way of Kandahar. Nominally all the provinces and districts of Baluchistan, with the exception of the ceded territory which we call British Baluchistan, are under the khan of Kalat, and all chiefs acknowledge him as their suzerain. But it may be doubted if this suzerainty was ever complete, or could be maintained at all but for the assistance of the British government. The Baluch is still essentially a robber and a raider (a trait which is common to all tribes), and the history of Baluchistan is nothing but a story of successful robberies, of lawless rapine and bloodshed, for which plunder and devastation were accounted a worthy and honourable return. Educated men are made conscious of the climatic condition of the country—changes which are some of those so recent as to be noted by surgeons who have found the remains of forests in districts now entirely desiccated. Possibly the ordinary processes of denudation and erosion, acting on those recent deposits which were left behind during the retreat of the ice ages, have been involved in a reformation which is resulting in a relative rise of the ground, over the crests of antiliinal folds, within historic record. "Proof that this compression is still going on was given on 20th December 1892, when a severe earthquake from the sea (the largest yet on the coast) thar appears to be an old line of fault, west of the Kawa Amran range, where an adjustment took place indicated by a shortening of some 21 ft., on the railway line which crossed the fault." Not only should the evidences of active volcanic activity accorded to the mud volcanoes of the coast be overlooked. It is probably to climatic changes (whatever their origin may have been), rather than to the effects of tribal disturbances, that the Arab's disappearance from the field of trade and agriculture, as well as that of the white men who settled along the coast during the 16th and 17th centuries is to be attributed.
Baluchistan language belongs to the Iranian branch of the Aryan sub-family of the Indo-European family. It is divided into two main dialects which are so different that speakers of the one are almost unintelligible to speakers of the other. These two dialects are separated by the belt of Brahui and Sindhi speakers who occupy the Saeen and Jhalawan hills, and Las Bela. Owing probably to the fact that Makran was for many generations under the rule of the Persian kings, the Baluchi spoken on the west of the province, which included Makran, was largely integrated with Persian words and expressions than the Eastern dialect. In the latter the words in use for common objects and acts are nearly all pure Baluchi, the remainder of the language being borrowed from Persian, Sindhi and Panjabi. There is no indigenous literature, but many specimens of poetry exist in which heroes and events are commemorated, and a good many of these have been collected from time to time. The philological classification of the Brahui dialect has been much disputed, but the latest enquiries, conducted by Mr. Bertram, have resulted in its placing it among the Dravidian languages. It is remarkable to find in Baluchistan a Dravidian tongue, surrounded on all sides by Aryan languages, and with the next nearest branch of the same family located so far away as the Good hills of central India. Brahui has a literature of its own, and such knowledge as we possess of it is due to European scholars, such as Bellon, Trump and Caldwell. Numerically the Brahuis are the strongest race in Baluchistan. They number nearly 200,000, and their number is growing yearly at the rate of 74,000. They are to be found in the largest numbers in Zhob, Quetta, Fishin and Thal-Chatiali, but there are a few of them in Kalat and Chagai also. The most important Baluch tribes are the Marris, the Bughis, the Baluchis, the Makranis, the Khptis, the Batis, the Baluchis of the tribal system, and partly to the levelling effect of Islam, nothing similar to the Brahmanical system of social precedent is to be found in Baluchistan.

History—Of the early history of this portion of the Asiatic continent little or nothing is known. The poverty and natural strength of the country, combined with the ferocious habits of the natives, seem to have equally repelled the friendly visits of Inquisitive strangers and the hostile incursions of invading armies. The first distinct account which we have is from Arrian, who, with his usual brevity and severe accuracy, narrates the march of Alexander through this region, which he calls the country of the Oreilae and Gadoris. 1 He gives a very accurate account of this forlorn tract, its general aridity and the necessity of collecting water by digging, in the beds of torrents; describes the food of the inhabitants as dates and fish; and adverts to the occasional occurrence of fertile spots, the abundance of aromatic and thorny shrubs and fragrant plants, and the violence of the monsoon in the western part of Makran. He notices also the impossibility of supporting a large army, and the consequent destruction of the greater part of the men and beasts which accompanied the expedition of Alexander. In the 8th century this country was traversed by an army of the Caliphate. The precise period at which the Brahuis gained the mastery cannot be accurately ascertained; but it was probably about two and a half centuries ago. The last raj of the Hindu dynasty found himself compelled to call for the assistance of the mountain shepherds, with their leader, Kambir, in order to check the encroachments of a horde of depredators, headed by an Afghan chief, who infested the country and even threatened to attack the seat of government. Kambir successfully performed the service required of him; and, after thevk years quelled the robbers against whom he had been called in, and finding himself at the head of the only military tribe in the country, he formally deposed the rajah and assumed the government.

The history of the country after the accession of Kambir is as obscure as during the Hindu dynasty. It would appear, however, that the sceptre was quietly transmitted to Abdulla Khan, the fourth in descent from Kambir, who, being an intrepid and ambitious soldier, turned his thoughts towards the conquest of Kach Gandava, then held by petty chief under the authority of the nawabs of Sind. 2

After various success, the Kambarans at length possessed themselves of the sovereignty of a considerable portion of that

1 See V. A. Smith, Early Hist. of India (ed. 1906), p. 103 seq.

2 After various success, the Kambarans at length possessed themselves of the sovereignty of a considerable portion of that

fruitful plain, including the chief town, Gandava. It was during this contest that the famous Nadir Shah advanced from Persia to the invasion of Hindustan; and while at Kandahar he despatched several detachments into Baluchistan and established his supremacy in that province. Abdulla Khan, however, was continued in the government of the country by Nadir's orders; but he was soon after killed in a battle with the forces of the nawabs of Sind. He was succeeded by his eldest son, Haji Mahommed Khan, who abandoned himself to the most tyrannical and licentious way of life and alienated his subjects by oppressive taxation. In these circumstances Nasir Khan, the second son of Abdulla Khan, who had accompanied the victorious Nadir to Delhi, and acquired the favour and confidence of that monarch, returned to Kalat and was hailed by the whole population as their delver. Finding that expostulation had no effect upon his brother, he one day entered his apartment and stabbed him to the heart. As soon as the tyrant was dead, Nasir Khan mounted the musnad amidst the universal joy of his subjects; and immediately transmitted a report of the events which had taken place to Nadir Shah, who was then encamped near Kandahar. The shah received the intelligence with satisfaction, and despatched a firman, by return of the post, appointing Nasir Khan beglar begi (prince of princes) of all Baluchistan. This event was the beginning of the independent rule of the tribe.

Nasir Khan proved an active, political and warlike prince. He took great pains to re-establish the internal government of all the provinces in his dominions, and improved and fortified the city of Kalat. On the death of Nadir Shah in 1747, he acknowledged the title of the king of Kabul, Ahmad Shah (Durani). In 1758 he declared himself entirely independent; upon which Ahmad Shah despatched a force against him under one of his ministers. The khan, however, raised an army and totally routed the Afghan army. On receiving intelligence of this discomfiture, the king himself marched with strong reinforcements, and a pitched battle was fought in which Nasir Khan was worsted. He retired in good order to Kalat, whither he was followed by the victor, who invested the place with his whole army. The khan made a vigorous defence; and, after the royal troops had been foiled in their attempts to take the city by storm or surprise, a negotiation was proposed by the victor which terminated in a treaty of peace. By the treaty it was stipulated that the king was to receive the cousin of Nasir Khan in marriage; and that the khan was to pay no tribute, but only, when called upon, to furnish troops to assist the armies, for which he was to receive an allowance in cash equal to half their pay. The khan frequently distinguished himself in the subsequent wars of Kabul; and, as a reward for his services, the king bestowed upon him several districts in perpetual and entire sovereignty. Having succeeded in quelling a dangerous rebellion headed by his cousin Behram Khan, this able prince at length died in extreme old age in the month of June 1795, leaving three sons and five daughters. He was succeeded by his eldest son, Mahmud Khan, then a boy of about fourteen years. During the reign of this prince, who has been described as a very humane and indolent man, the country was distracted by sanguinary broils; the governors of several provinces and districts withdrew their allegiance; and the dominions of the khan gradually diminished till they now comprehend only a small portion of the provinces formerly subject to Nasir Khan. In 1839, when the British army advanced through the Bolan Pass towards Afghanistan, the conduct of Mehrab Khan, the ruler of Baluchistan, was considered so treacherous and dangerous as to require " the exaction of retribution from that chieftain," and "the execution of such arrangements as would establish future security in that quarter." General Willshire was accordingly detached from the army of the Indus with 10,50 men to assault Kalat. A gate was knocked in by the field-pieces, and the town and citadel were stormed in a few minutes. Above 400 Baluches were slain, among them Mehrab Khan himself; and 2,000 prisoners were taken. Subsequent inquiries have, however, proved that the treachery towards the British was not
on the part of Mehrab Khan, but on that of his vizier, Mohammad Husain Khan. As chief of the main chiefs, with whom he was in league, and at whose instigation the British convoys were plundered in their passage through Kach Gandava and in the Bolan Pass. The treacherous vizier, however, made our two credulous political officers believe that Mehrab Khan was to blame; his object being to bring his master to ruin and to obtain for himself all power in the state, knowing that Mehrab's successor was only a child. How far he succeeded in his object history has shown. In the following year Kalat changed hands, the governor established by the British, together with a feeble garrison, being overpowered. At the close of the same year it was reoccupied by the British under General Nott. In 1841 Nasir Khan II., the youthful son of the slain Mehrab Khan, was recognized by the British, who soon after evacuated the country.

From the conquest of Sind by the British troops under the command of General Sir Charles Napier in 1843 up to 1854 no diplomatic intercourse occurred worthy of note between the British and Baluch states. In the latter year, however, under the governor-generalship of the marquis of Dalhousie, General John Jacob, C.B., at the time political superintendent and commander on the Sind frontier, was deputed to arrange and conclude a treaty between the Kalat state, then under the chiefship of Nasir Khan and the British government. This treaty was executed on the 14th of May 1854 and was to the following effect:-

"That the former offensive and defensive treaty, concluded in 1841 by Major Outram between the British government and Nasir Khan II., chief of Kalat, was to be annulled.

"That Nasir Khan II., his heirs and successors, bound themselves to oppose to the utmost all the enemies of the British government, and in all cases to act in subordinate co-operation with that government, and to enter into no negotiations with other states without its consent.

"That should it be deemed necessary to station British troops in any part of the territory of Kalat, they shall occupy such positions as may be thought advisable by the British authorities.

"That the Baluch chief was to prevent all plundering on the part of his subjects within or in the neighbourhood of British territory.

"That he was further to protect all merchants passing through his territory, and only to exact from them a transit duty, fixed by the British government, in consideration of a faithful performance of these duties, he was to receive from the British government an annual subsidy of Rs.50,000 (£5000).

The provisions of the above treaty were most loyally performed by Nasir Khan up to the time of his death in 1856. He was succeeded by his brother, Mir Khodadad Khan, when a youth of twelve years of age, who, however, did not obtain his position before he had put down by force a rebellion on the part of his turbulent chiefs, who had first elected him, but, not receiving what they considered an adequate reward from his treasury, sought to depose him in favour of his cousin Sher dil Khan. In the latter part of 1857, the Indian rebellion being at its height and the city of Delhi still in the hands of the rebel, a British officer (Major Henry Green) was deputed, on the part of the British government, to reside as political agent with the Khan at Kalat and to assist him by his advice in maintaining control over his turbulent tribes. This duty was successfully performed until 1863, when, during the temporary absence of Major Malcolm Green, the then political agent, Khodadad Khan was, at the instigation of some of his principal chiefs, attacked while out riding by his cousin, Sher dil Khan, and severely wounded. Khodadad fled in safety to a residence close to the British border, and Sher dil Khan was elected and proclaimed Khan. His rule was, however, a short one, for early in 1864, when proceeding to Kalat, he was murdered in the Gandava Pass; and Khodadad was again elected chief by the very men who had only the previous year caused his overthrow, and who had lately been accomplices to the murder of his cousin. After the above events Khodadad maintained his precarious position with great difficulty, succeeding, however, to govern his unruly subjects without material assistance from the British government, which they were not disposed to give, his country gradually fell into the greatest anarchy; and, consequently, some of the provisions of the treaty of 1854 having been broken, diplomatic relations were discontinued with the Kalat state after the end of 1874.

After this the chiefs of Las and Wad, the Marris and Bugis, Koj and Makran all threw off their allegiance, and anarchy became so widespread that the British government again interfered. The treaty of 1854 was renewed in 1876 by Lord Lytton (under Sandeman's advice), and the khan received substantial aid from the government in the form of an annual subsidy of a lakh of rupees, instead of the Rs. 50,000 previously assigned to him. The treaty of 1854 was a treaty of alliance offensive and defensive. The treaty of 1876 renewed these terms, but utterly changed the policy of non-intervention which was maintained by the former, by the recognition of the sirdars as well as the khan, and by the appointment of the British government as referee in cases of dispute between them. British troops were to be located in the khan's country; Quetta was founded; telegraphs and railways were projected; roads were made; and the reign of law and order established. The nebulous claims of Afghanistan to Sibi and Pishin were disposed of by the treaty of Gandamak in the spring of 1879, and the final consolidation of the existing form of Kalat administration was effected by Sandeman's expedition to Kharan in 1883, and the reconciliation of Azad Khan, the great Naushirwani chief, with the khan of Kalat. British Baluchistan was incorporated with British India by the resolution of 1st November 1887, and divided into two districts—Quetta-Pishin and Thal Chotiali—to be administered by a deputy-commissioner and a regular staff.

In 1890 and 1891 were carried out that series of political-military expeditions which resulted in the occupation of the Zhob valley, the foundation of the central cantonment of Fort Sandeman, and the extension of a line of outposts which, commencing at Quetta, may be said to rest on Wana north of the Gomal. The effect of these expeditions, and of this extension of military occupation, has been to reduce the independent Pathan tribes of the Sullman mountains to effective order, and to put a stop to border raiding on the Indus plains south of the Gomal. In 1893 serious differences arose between the khan of Kalat and Sir James Browne, who succeeded Sir Robert Sandeman as agent to the governor-general in Baluchistan, arising out of Mir Khodadad Khan's outrageous conduct in the management of his own court, and the treatment of his officials. Finally, the khan was deposed, and his son Mir Mahmud Khan succeeded in November 1893. Since then the most important change in Baluch administration has been the perpetual lease and transfer of management to British agency of the Nushki district and Niblat, with all rights, jurisdiction and administrative power, in lieu of a perpetual rent of Rs.9,000 per annum. This was effected in July 1899. This secures the direct control of the great highway to Seistan which has been opened to khafila and railway traffic.

The revenues of the khan of Kalat consist partly of subsidies and partly of agricultural revenue, the total value being about Rs.50,000 per annum. Since 1858 he has received Rs.25,000 as governor's rent for the Quetta district, besides Rs.30,000 in lieu of transit duties in the Boian; this has been increased lately by Rs.9,000 as already stated. In 1899 the total imports of Kalat were valued at Rs.70,000, and the exports at Rs.50,000.

**BALUCHISTAN**, a province of Persia consisting of the western part of Baluchistan (q.v.) in a wider sense. Persian Baluchistan has an area of about 60,000 sq. m., and lying along the northern shore of the Arabian Sea, is bounded E. by British and
independent Baluchistan, N. by Seistan and the central Persian desert, and W. by Kerman. The country has little water and only a small part of it is under cultivation, the remainder being composed of arid, waterless plains, deserts—some stony, others with moving sands—barren hills and mountains. The principal rivers are the Mashkidi and that of Bampur which flow away from the sea and are lost in depressions called hamuns. The rivers which flow into the sea are unimportant and dry during the greater part of the year. Persian Baluchistan forms an administrative division of the province of Kerman and is subdivided into the following twenty districts:—(1) Bampur; (2) Serhad; (3) Dizek; (4) Jalk; (5) Sib; (6) Irafshan; (7) Magas; (8) Serbaz; (9) Lashar; (10) Champ; (11) Fannuj; (12) Bazman; (13) Aptar; (14) Damain; (15) Aprandagan; (16) Astfeh; (17) Surjum; (18) Meskutan; (19) Pushnet; (20) Makran, the country of the Ichthyophagi, with the subdistricts Kaskard, Geh, Bint, Dashi, Kucheh and Bahu. The total population of Baluchistan is under 200,000. The province was practically independent until the occupation of Bampur by Persian troops in 1849, and over some of the extreme eastern districts Persian supremacy was not recognized until 1872.

BALUZE—BALUZE

(1593-1718), French scholar, was born at Tulle on the 24th of November 1630. He was educated at his native city and at an early age won minor orders. As secretary to Pierre de Marca, archbishop of Toulouse, he won the appreciation of that learned prelate to such a degree that at his death Marca left him all his papers. Thus it came about that Baluze produced the first complete edition of Marca’s treatise De libertatis Ecclesiæ Gallicaneæ (1633), and brought out his Marca hispanica (1688 f.). About 1667 Baluze entered Colbert’s service, and until 1700 was in charge of the invaluable library belonging to that minister and to his son the marquis de Seignelai. He enriched it prodigiously (see the history of the Colbertine library in the Cabinet des Manuscrits by M. Léopold Delisle, vol. i.), and Colbert rewarded him by obtaining various benefices for him, and the post of king’s almoner (1679). Subsequently Baluze was appointed professor of Canon law at the Collège de France on the 31st of December 1689, and directed that great institution from 1707 to 1710.

The works which place him in the first rank of the scholars of his time are the Capitularia Regum Franchorum (1674; new edition enlarged and corrected in 1780); the Nova Collectio Conciliorum (1721-1727); the Miscellanea (7 vols., 1678-1715; new edition revised by M. Jean-Thirion in 1764); the Letters of Pope Innocent III. (1682); and, finally, the Vie de Popes XIV., 1705-1739 (1693). But he was unfortunate enough to take up the history of Auvergne just at the time when the cardinal de Bouillon, inheritor of the rights, and above all of the ambitious pretensions of the La Tour family, was endeavouring to prove the descent of that house in the direct line from the ancient hereditary counts of Auvergne of the 9th century.

As authentic documents in support of these pretensions could not be found, false ones were fabricated. The production of spurious genealogies had already begun in the Histoire de la maison d’Auvergne published by Christophe Justel in 1645, and Chorier, the historian of Dauphiny, had included in the second volume of his history (1672) a forged deed which connected the La Tours of Dauphiny with the La Tours of Auvergne. Next a regular manufactory of forged documents was organized by a certain Jean de Bar, an intimate companion of the cardinal. These forgeries were skillful enough, for they succeeded in duping the most industrious scholar, Dom Jean Mabillon, the founder of Diplomatics, Dom Thirion, Roman scholar, who, himself, called as experts, made a unanimously favourable report on the 23rd of July 1695. But cardinal de Bouillon had many enemies, and a war of pamphlets began. In March 1698 Baluze in reply wrote a Letter which proved nothing. Two years later, in 1700, Jean de Bar and his accomplices were arrested, and after a long and searching inquiry were declared guilty in 1704. Baluze, nevertheless, was obstinate in his opinion. He was convinced that the incriminated documents were genuine and proposed to do Justel’s work anew. Encouraged and financially supported by the cardinal de Bouillon, he first produced a Table généalogique in 1705, and then in 1707 a Histoire généalogique de la maison d’Auvergne, with “Proofs,” among which, unfortunately, we find all the deeds which had been pronounced spurious. In the following year he was suddenly engulfed in the disgrace which overtook his ingrying patron: deprived of his appointments, pensions and benefices, he was exiled far from Paris. None the less he continued his work, and in 1710 published a history of his native town, Histoire de laudèves libri tres. Before his death he succeeded in returning to Paris, where he died unconvinced of his errors on the 28th of July 1718. Was he dupe or accomplice? The study of his correspondence with the cardinal gives the impression that he was the victim of clever cheats.

The history of the forgeries committed in the interests of the house of Bouillon forms a curious and instructive episode in the history of French scholars in the time of Louis XIV. It is to be found in the Manuel de diplomatique by A. Giry; and above all in a note to the Oeuvres de Saint-Simon by M. de Boisilé (vol. iv. pp. 533-585). The bibliography of Baluze’s researches has been made by M. René Fage (1882, 1884) and his Life told by M. Emile Fage (1890). To these must we add an amusing book by G. Clement-Simon, La Gaité de Baluze; documents biographiques et littéraires.
(1888). Balzac's will has been published by M. Léopold Delisle (Bibliothèque de l'École de Charles, 1872); his papers are now in the Bibliothèque Nationale in Paris, and in the Bibliothèque de l'Arvalen (Revue historique, t. xcviii. p. 309). See also the article by Arthur du Boisblain in the Revue des questions historiques for October 1908 (C. B.)

BALZAC, HONORÉ DE (1799-1850), French novelist, was born at Tours on the 20th of May 1819. His father, Bernard François, never called himself de Balzac and Honoré only assumed the particle after 1830. But the father had equally little right to the name of Balzac at all, for his birth-certificate has been recently discovered. The true name was "Balas," and this in various forms ("Balsa," "Balas") has been traced for more than a century before the novelist's birth as that of a family of day-labourers or very small peasant proprietors in the parish of Canezac, department of the Tarn. It is probable that the novelist himself was not aware of this, and his father appears to have practised some mystification as to his own professional career. In after the Revolution, however, he actually attained positions of some importance in the commissions and hospital departments of the army, and he married in 1788 Anne Charlotte Laure Sallambier, who was a beauty, an heiress, and a woman of considerable faculty. She survived her son; the father died in 1829. There were two sisters (the elder, Laure, afterwards Madame Survile, was her brother's favourite and later his biographer), and a younger brother, Henri, of whom we hear little and that little not very favourable.

Honoré was put out to nurse till he was four years old, and in 1806, when he was seven, was sent to the collège (grammar school) of Vendôme, where he remained till April 1813 as a strict boarder without any holidays. From this he passed as a day-boy to the collège of Tours. His father's official work was transferred to Pans the year after, and Balzac came under the teaching of a royalist private schoolmaster, M. Lepitre, and others. He left school altogether in 1816, being then between seventeen and eighteen. His experiences at Vendôme served as base for much of Louis Lambert, and he seems to have been frequently in disgrace. Later, his teachers appear to have found him remark- able neither for good nor for evil. He was indeed never a scholar; but he must have read a good deal, and as he certainly had no time for it later, much of this reading must have been done early.

The profession which Balzac's father chose for him was the law; and he not only passed through the schools thereof, and duly obtained his licence, but had three years' practical experience in the offices of a notary and a solicitor (avoué), for the latter of whom, M. Guillaume-Merville, he seems to have had a sincere respect. But though no man of letters has ever had, in some ways, such a fancy for business, no man of business could ever come out of such a born man of letters. And when in 1820 (the licence having been obtained and M. Balzac, senior, having had some losses) the father wished the son to become a practising lawyer in one or another branch, Honoré revolted. His family had left Paris, and they tried to make him into a solicitor by establishing him in a garret with a very small allowance. Here he began to write tragedies, corresponded (in letters which have fortunately been preserved) with his sister Laure, and, most important of all, attempted something in prose fiction. The tragedy Cromwell was actually completed and read to friends, but not to others; many more, the manuscript exists in the hands of M. Spolberles de Lovenjoul, the great authority on Balzac's life and bibli- ography; but it has never been published. The novels, Coupres and Stella, proved abortive, but were only the first of many attempts at his true way until he found it. Drama he never abandoned; but for him it was always an error.

The garret-period from 1820 to 1822 was succeeded by another of equal length at home, but before it had finished (1821) he found his way into print with the first of the singular productions which (and that not entirely or finally) have taken a sort of outside place in his works under the title of Oeuvres de jeunesse. The incunabula of Balzac were Les Deux Héros, ou Des Deux Familles bretonnes, and Charles Poirot, ou Mon Cousin de la main gauche. They were followed next year by six others:—L'Héritière de Birague; Jean Louis, ou La Fille trouvée; Clotilde de Lusignan, ou Le Bouf Juif; Le Centenaire, ou Les Deux Beringhale; Le Vicare des Ardennes; Le Tartare, ou Le Retour de l'Éréd. And these again followed up in 1832 by three more:—La Dernière Fée, ou La Nouvelle Lampe merveilleuse; Michel et Christine et la suite; L'Anonyme, ou Ni père ni mère. In 1834 came Arnette et le criminel, a continuation of the Vicare; in 1835, Wann-Chloé, which afterwards took the least extravagant title of Jane la pâle. These novels, which filled some two score volumes originally, were published under divers pseudonyms ("Lord R'hooine," an anagram of "Honoré," "Horace de Saint Aubin," &c.), and in actual collaboration with two or three other writers. But though there is not yet in them anything more than the faintest dawn of the true Balzac, though no one of them is good as a whole, and very few parts deserve that word except with much qualification, they deserve far more study than they have usually received, and it is difficult to apprehend the true Balzac until they have been studied. They ceased for a time, not because of the author's conviction of their badness (though he entertained no serious delusions on this subject), nor because they failed of a certain success in actual money return, but because he had taken to the undertakings of the most despised of all his dabblings in business—this time as a publisher to some extent and still more as a printer and type-founder. Not very much was known about his experiences in this way (except their general failure, and the result in hampering him with a load of debt directly for some ten years and indirectly for the whole of his life) till in 1903 MM. Hontiaux and Vicaire published the results of their inquiries into the actual accounts of the concern.

There seems to have been no reason why it should not have succeeded, and there has been claimed for it first, that it provided Balzac with a great amount of actual detail which he utilized directly in the novels, and secondly, that it gave him at whatever cost a still more valuable experience of practical life— the experience which has so often been wanting to men of letters. Anyhow, from 1825 to 1828, the future author of the Comédie humaine was a publisher, printer and type-founder; and in the last year he had to abscond, or something like it, under pressure of debts which were never fully settled till 1838, and then by a further obligation of ninety thousand francs, chiefly furnished by his mother and never repaid to her.

It was Balzac's habit throughout his life to relieve the double pressure of debt and of work by frequent excursions into the country and abroad. On this occasion he fled to Brittany with an introduction to a M. and Mme. de Pommeure, who received him hospitably in their château near Fougeres. Here he obtained some of the direct material, and most of the scenery and atmosphere, for what he himself recognized as his first serious attempt in novel-writing, Les Chouans, or, as it was first called, Le Dernier Chouan. This book (obviously written in direct following of Scott, of whom Balzac was a lifelong admirer) has been very variously judged those who lay most stress on his realism thinking little of it, while those who maintain that he was always a romantic "with a difference" place it higher. It has at any rate brilliant colouring, some very vivid scenes, and almost more passion as well as "curtain" at its ending than any other of his books. Though not without a touch of melodrama it differs utterly from the confused and tedious imitations of Mrs Radcliffe, M. G. Lewis and C. R. Maturin which fill most of the Oeuvres de jeunesse. At the same time Balzac was engaged on a very different work, the analytic-satirical sketches which compose the Physiologie du mariage, and which illustrate his other and non-romantic side, again with some crudity, but again also with a vast advance on his earlier productions. Both were published in the year 1830, from which his real literary career unquestionably starts. It had exactly twenty-one years to run.

The history of these twenty-one years, though (in consequence mainly of the diligence and luck as a collector of the above- named M. de Lovenjoul) the materials for it are large and constantly accumulating, has never been arranged in a really standard biography, and there seems to be an increasing habit of concentrating the attention on parts of it. It divides itself under three heads mainly, the history of Balzac's business affairs, that
of his loves and friendships and that of his actual work. The first has some small resemblance to Scott's similar experiences, though in Balzac's case there was no great crash but a lifelong pressure; on the whole, his debts were brought upon him by a long course not so much of extravagance in actual expenditure (though there was something of this) as of financial irregularities of almost every description—anticipations of earnings, costly methods of production (he practically wrote his novels on a succession of printed reissues), speculations, travel, and lastly the collection of curiosities. As regards the second, although his fashion of life made him by turns a hermit and a vagrant, he was on good terms with most of the famous men of letters of his day from Hugo downwards, and seems never to have quarrelled with any man, except with some of his editors and publishers, by his own fault. Balzac was indeed, in no belittling sense of the word, one of the most good-natured of men of genius. But his friendships with the other sex are of much more importance, and not in the least matters of mere gossip. His sister Laure, as has been said, and a school-friend of hers, Mme Zulma Carraud, played important and not questionless parts as his correspondents. But at least three ladies, all of a rank higher than his own, figure as his Etranger: an extent to which it is hardly extravagant to say that Balzac would not have been Balzac without them. These are Madame de Berny, a lady connected with the court of the ancien régime, much older than himself and the mother of nine children, to whom he was introduced in 1821, who became to him La dilecta, who was the original of Mme de Morteau in Le Lyce dans la vallée, and who seems to have exercised an excellent influence on him in matters of taste till her death in 1836; the marquise de Castries, who took him up for a time and dropped him, and who has been supposed to have been his model for his less impeccable ladies of fashion; and lastly, the Polish-Russian countess Evelina Hanska, who after addressing, as l'Etrangère, a letter to him as early as 1832, became his idol, rarely seen but constantly corresponded with, for the last eighteen years, and his wife for the last few months of his life. Some of his letters to her have long been known, but the bulk of them constituted the greatest recent addition to our knowledge of him as given in the two volumes of Lettres à l'Etrangère. Of hers we have practically none and it is exceedingly hard to form any clear idea of her, but his devotion is absolutely beyond question.

Business, friendship and love, however, much more other things, were in Balzac's case always connected with and on the whole quite secondary to work. He would even sometimes resist the commands by which at long intervals Mme Hanska would summon him to see her, and abstract the greater part of his actual visits to her in order to serve this still more absorbing mistress. He had, as we have seen, worked pretty hard, even before 1829, and his work had partly taken forms not yet mentioned—political pamphlets and miscellaneous articles which are now accessible in the Édition définitive of his works, and hardly one of which is irrelevant to a just conception of him. Nor did he by any means abandon these by-works after 1829; indeed, he at one time started and almost entirely wrote, a periodical called the Revue positive, which was more than an excuse for the production of some dramas and plays, and many more things, though the few which reached the public saw again promptly. Balzac's dramas, as they appear in his works, consist of Vautrin, Les Ressources de Quinola, Pamela Giraud (arranged for the stage by others), La Marthe and Mercadet le fossoyeur, the last of which has, since his death, been not unsuccessful. But on the whole he did devote himself to his true vocation, with a furious energy beside which even Scott's, except in his sadder and later days, becomes leisurely. Balzac generally wrote (dining early and lightly, and sleeping for some hours immediately after dinner) from midnight till any hour in the following day—stretches of sixteen hours being not unknown, and the process being often continued for days and weeks. Besides his habit of correcting a small printed original into a long novel on the proofs, he was always altering and reshaping his work, even before, in 1824, he carried out the idea of building it all into one huge structure—the Comédie humaine with its subdivisions of Scènes de la vie parisienne, Études philosophiques, &c. Much pains have been spent upon this title and Balzac's intentions in selecting it. But the "Human Comedy," as a description for mere studies of life as his, will explain itself at once or else can never be explained.

Of its constituents, however, some account must be given, and this can be best done through an exact and complete list of the whole work by years, with such abbreviated notes on the chief constituents as may lead up to a general critical summary. Of the two capital works of 1829, we have spoken. 1830, the epoch year, saw part (it was not fully published till the next) of Le Peau de chagrin, one of the crudest, but according to some estimates, one of the greatest of the works, full of romantic extravagance and surplasage, but with an engrossing central idea—the Nemesis of accomplished desire—powerfully worked out; La Maison du chat qui pêle, a triumph of observation and nature, together with a crowd of things less in bulk but sometimes of the first excellence—El Verdugo, Étude de femme, La Pois du ménage, Le Bal des seaux, Le Vendetta, Gassonck, The Double Famine, Le Deux Rêves, Adieu, L'Elisir de longue vie, Sarrazin, Une Passion dans le désert and Un Episode sous la Terreur. In 1831, Le Peau de chagrin appeared complete, accompanied by Le Régisseur, Le Lys, Le Chef-d'œuvre inconnu (a masterpiece fortunately not unrecognized), Jésus Christ en Flandres and Maitre Cornélius. 1832 gave Madame Firmaison, Le Message, Le Colonel Chaberi and Le Curé de Tours (two stories of contrasted but extraordinary excellence), La Bourse, La Femme abandonnée, Louis Lambert (autobiographical and philosophic), Le Grenadiere and Les Morana (a great favourite with the author). In 1833 appeared Ferragus, chef des dévautors, the first part of L'Histoire des treize (a collection in the more extravagant romantic manner, very popular at the time, and since a favourite with some, but few, good judges), Le Médecin de compagne (another pet of the author's, and a kind of intended document of his ability to support the cause of virtue, but, despite certain great things, especially a wonderful "legend of Napoleon," a little heavy as a whole), which Matthew Arnold pronounced, "as the universally admitted masterpiece of Eugène Grandet, and L'Illustre Gauziart (very amusing). 1833 also saw the beginning of a remarkable and never finished work—at his usual scope but exceedingly powerful in parts—the Contes drolatiques, a series of tales of Old France in Old (or at least Rabelaisian) French, which were to have been a hundred in number but never got beyond the third batch of ten. They often borrow the licence of their 15th and 16th century models; but in La Sucche and others there is undoubtedly genius and not a little art. 1834 continued the Treize with La Duchesse de Langeais and added La Recherche de l'absolu (one of Balzac's great studies of monomania, and thought by some to be the greatest, though others prefer Le Chef-d'œuvre inconnu), La Femme de trente ans (the chief example of the author's caprice for re-handling, and very differently judged as a whole), with yet another of the acknowledged triumphs, Le Père Goriot. On the whole, this year's work, though not the author's largest, is perhaps his most unique. Next year (1835) followed Mémoine réconcilié (a tribute to the great influence of Balzac only, when this time in France), Un Drame au bord de la mer, the brilliant, if questionable, conclusion of Les Treize, La Fille aux yeux d'or, Le Contrat de mariage and Sérafphina. This last, a Swedeborgian rhapsody of beauty in parts, has divided critics almost more than anything else of his writer's, some seeing in it (with excuse) nothing but the short description given above in three words, the others (with justice) reckoning it his greatest triumph of style and his nearest attempt to reach poetry through prose. 1836 furnished La Messe de l'athée, Intercidia, Facino Cane, Le Lys dans la vallée (already referred to and of a somewhat sickly sweetness), L'Enfant maudit, La Vielle Fille and Le Secret des Ruggieri (connected with the earlier Les deux Rêves under the general title, Sur Cathérine de Médicis, and said to have been turned out by Balzac in a single night, which is hardly possible). In 1837 were published Les Deux Poètes, destined to form part of Illusions perdues, Les Employés, Gambard and another capital work, Histoire de la grandeur et de la décadence
de César Birotteau, where Balzac’s own unlucky experiences in trade are made thoroughly matter of art. 1838 was less fruitful, contributing only Le Cabinet des antiquites, which had made an earlier partial appearance, La Maison Nucingen and Une Fille d’Ève. But 1839 made amends with the second part of Illusions perdues, Un Grand Homme de province à Paris (one of Balzac’s minor diploma-pieces), Le Curé de village (a very considerable thing), and two smaller stories, Les Secrets de la princesse de Cadignan and Massimilla Doni. Pierrlette, Z. Marcas, Un Prince de la Bohème and Pierre Grassou followed in 1840, and in 1841 Une Ténébreuse Affaire (one of his most remarkable works—up of the minor facts of actual history), Le Martyr Calviniste (the conclusion of Sur Cathédrale de Médicis), Ursule Miroet (an admirable story), La Fausse Maîtresse and Mémories de deux jeunes maries, on which again there have been very different opinions. 1842 supplied Albert Sazarus (autobiographical largely), Un Début dans la vie, the very variously named and oftenreed Raboulleuse (which, since Taine’s exaltation of it, has often been taken as a Balzacian quintessence), and Autre Étude de femme, yet another rehandling of earlier work. In 1843 came the introduction of the completed Sur Cathédrale de Médicis Honorable et La Muse du département (almost as completely new, and a reconstructed work), Le Croule des Femmes (one of the admirable series entitled to the collected Splendeurs et misères des courtisanes), and a further instalment of Illusions perdues, Les Souffrances d’un inventeur. Three out of the four next years were astonishingly fruitful. 1844 gave Modeste Mignon (a book with a place to itself, and said to be founded on a story actually written by Madame Hanska), Gaudissart II., A combien l’amour revient aux vieillards (a second part of the Splendeurs), Beautir (one of the most powerful if not of the most agreeable), and the first and very promising part of Les Paysans. Only Un Homme d’affaires came out in 1845, but this was made up in 1846 by Les Comédien sans le savoir. In 1847, another part of the Splendeurs, Où mènent les mauvais chemins. With the third part of Les Parents pauvres, La Cousine Bette (sometimes considered the topmost achievement of Balzac’s genius), and the final form of a work first issued fifteen years earlier and often retouched, Petites misères de la vie conjugal (1847 was even richer, with Le Cousin Pons (the second part of the Parisiennes, and again a masterpiece), the conclusion of the Splendeurs, Le Dernier Incarnation de Vautrin, L’Envers de l’histoire contemporaine (which had been on and off the stocks for five years), and the unfinished Dépôt d’Arcis. This was the last scene of the comedy that appeared in the life of its author. The conclusion of the Dépôt d’Arcis, published in 1853, and those of Les Paysans and Les Petits Bourgeois which appeared, the first in this year, the second wholly in 1855, are believed or known to be by Balzac’s friend, Charles Rabou (1803-1871).

This immense and varied total stands to its author in a somewhat different relation from that of any other work to any other writer. It has been well said that the whole of Balzac’s production was always in his head together; and this is the main justification for his syllabus of it as “Comedy.” Some part never came out of his head into print; we have numerous titles of work (sometimes spoken of in his letters as more or less finished) of which no trace remains, or only fragmentary MS. skits. One apparently considerable book, La Bataille, which was to be devoted to the battle of Essling, and for which he actually visited the ground, is frequently referred to as in progress from the time of his early letters to Madame Hanska onwards; but it has never been found. Another result of this relation was the constant altering, re-shaping, re-connecting of the different parts. That if Balzac had lived as long as Hugo, and had preserved his faculties as well, he could never have finished the Comédie, is of course obvious: the life of Methuselah, with the powers of Shakespeare, would not suffice for that. But that he never would—even if by some impossibility he could—is almost equally certain. Whether there is any mark of decline in his latest work has been disputed, but there could hardly have been farther advance, and the character of the whole, not easy to define, is much less hard to comprehend, if prejudice be kept out of the way. That character was put early, but finally, by Victor Hugo in his funeral discourse on Balzac, whose work he declared, with unusual terseness, among other phrases of more or less gorgeous rhetoric, to be “observation and imagination.” It may be doubted whether all the volumes written on Balzac (a reasoned catalogue of the best of which will be found below) have ever said more than three words, or have ever said it more truly if the due stress be laid upon the “and.” On the other side, most of the mistakes about him have arisen from laying undue stress on one of the two qualities, or from considering them separately rather than as inextricably mixed and blended. It is this blending which gives him his unique position. He is an observer of the most exact, the most minute, the most elaborate; but he suffuses this observation with so strange and constant an imaginative quality that he is, to some careful and experienced critics, never quite “real”—or almost always something more than real. He seems accustomed to create in a fashion which is not so much of the actual world as of some other, possible but not actual—no matter whether he deals with money or with love, with Paris or with the provinces, with old times or with new. A further proof of this almost supernatural faculty is the fact that though Balzac has virtuous characters, he sees his highest work in them “black” and that, whether he actually prefers the delineation of fortune, failure, or not, he produces as a rule in the readers the sensation familiarly described as “uncomfortable.” His morality has been fiercely attacked and valiantly defended, but it is absolutely certain that he wrote with no immoral intention, and with no indifference to morality. In the same way there has been much discussion of his style, which seldom achieves beauty, and sometimes falls short of correctness, but which still more seldom lacks force and adequacy to his own purpose. On the whole, to write with the shorthand necessary here, it is idle to claim for Balzac an absolute supremacy in the novel, while it may be questioned whether any single book of his, or any scene of a book, or even any single character or situation, is among the very greatest books, scenes, characters, situations in literature. But no novelist has created on the same scale, with the same range; none has such a cosmos of his own, pervaded with a sense of the originality and power of its creator.

Balzac’s life during the next twenty years of strenuous production has, as regards the production itself, been delineated in one of its outward events, its distractions or avocations—where there is from that almost weekly process of “raising the wind,” of setting old debts by contracting new ones, which seems to have taken up no small part of it—must now be dealt with. Besides constant visits to the Margonne family at Saché in Touraine, and to the Carrauds at Frapesle in Berry, he travelled frequently in France. He went in 1833 to Neuchâtel for his first meeting with Madame Hanska, to Geneva later for his second, and to Vienna in 1835 for his third. He took at least two flights to Italy, in more or less curious circumstances. In 1838, he went on a journey to Sardina to make his fortune by melting the silver out of the slag-heaps of Roman mines,—a project, it seems, actually feasible and actually accomplished, but in which he was anticipated. The year before, tired of Paris apartments, he had bought ground at Ville d’Avray, and there constructed, certainly at great, though perhaps exaggerated expense, his villa of Les Jardins, which figures largely in the Balzacian legend. His rash and complicated literary and financial arrangements (it must be added with disregard of them when the whim took him, brought him into frequent legal difficulties, the most serious of which was a law-suit with the Revue de Paris in 1836. In 1831, and again in 1834, he had thought of standing for election as Deputy, and in the latter year he actually did so both at Cambrai and Angoulême; but it is not certain that he received any votes. He also more than once took steps to become a candidate for the Academy, but retired on several occasions before the voting, and when at last, in 1849, he actually stood, he only obtained two votes.

As early as the Geneva meeting of 1835, Madame Hanska had formally promised to marry Balzac in the case of her husband’s
Balzac—Bamberg

observed par excellence. In English, translations of separate books are innumerable; of the whole, besides that mentioned above, but containing a few things there omitted, an American version by Miss Worneley and others may be mentioned. The most elaborate monumental edition in English is certainly the Riemenschneider's Balzac (1887), with a useful bibliography up to the time. The recent additions to our knowledge are utilized in Miss Mary F. Sandars' Balzac (1904), a rather popular, but full and readable summary, and in W. H. Helm's Aspects of Balzac (1905), which is critical as well as anecdotical. The present writer, besides the critical and biographical essays referred to above, prefixed a shorter one to a translation of Lettres de Malherbe in 1899. C. S.

Balzac, Jean Louis Guizot de (1791-1854), French author, was born at Angoulême in 1791. At the age of eight he travelled in Holland with Théophile de Viau, with whom he later exchanged bitter recriminations. He was early befriended by the duc d'Épernon and his son Louis, Cardinal de la Valette, who took him to Rome. His letters written to his acquaintances and to many who held a high position at the French court gained for him a great reputation. Compliments were showered upon him, he became an habitué of the Hôtel de Rambouillet, and his head appears to have been turned a little by his success. Richelieu was lavish of praise and promises, but never offered Balzac the preferment he expected. In 1824 a collection of his Lettres was published, and was received with great favour. From the château of Balzac, whither he had retired, he continued to correspond with Jean Chapelain, Valentin Conrat and others. In 1825 he was elected to the Academy. He died at Angoulême on the 10th of February 1854. His fame rests chiefly upon the Lettres, a second collection of which appeared in 1837. A third, Les nouvelles lettres was published in the next year. His letters, though empty and affected in matter, show a real mastery of style, introducing a new clearness and precision into French prose and encouraging the development of the language on national lines by emphasizing its most idiomatic elements. Balzac has thus the credit of executing in French prose a reform parallel to Malherbe's in verse. In 1831 he published an eulogy of Louis XIII. entitled Le Prince; in 1852 the Socrate chrétien, the best of his longer works; Aristippe ou de la Cour in 1858, and several dissertations on style.

His Oeuvres were collected (2 vols.) in 1865 by Valentine Conrat. There are numerous English translations from Balzac, dating from the 17th century.

Bamberg, a town and archiepiscopal see of Germany, in the kingdom of Bavaria. Pop. (1883) 31,521; (1905) 45,708. It lies on an open plain on the river Regnitz, 2 m. above its junction with the Main, and 39 m. north of Nuremberg by railway. The upper town is built on seven hills, each crowned by a church, while the lower, still partially surrounded by walls and ditches, is divided by the river and Ludwigskaal into three districts. The cathedral is a noble late Romanesque building with four imposing towers. It was founded in 1004 by the emperor Henry II., finished in 1012, afterwards partially burnt, and rebuilt in the 13th century. Of its many works of art may be mentioned the magnificent marble tomb of the founder and his wife, the empress Constance, carved by Tilman Riemenschneider between 1490 and 1513, and an equestrian statue of the emperor Conrad III. Other noteworthy churches are the Jakobskirche, an 11th-century Romanesque basilica; the Michaelskirche, a Romanesque church of the 8th century (1320-1387), which has now been restored to its original pure Gothic style. The Michaelskirche, 12th-century Romanesque (restored), on the Michaelsberg, was formerly the church of a Benedictine monastery secularized in 1803, which now contains...
the Bürgerspital, or alms-house, and the museum and municipal art collections. Of the bridges connecting the sections of the lower town the most interesting is the Obere Brücke, completed in 1435. Halfway across this, on an artificial island, is the Rathaus (rebuilt 1744-1756). The royal lyceum, formerly a Jesuit college, contains notable collections and the royal library of over 300,000 volumes. The picturesque Old Palace (Alte Residenz) was built in 1591 on the site of an old residence of the counts of Babenberg. The New Palace (1668-1704) was formerly occupied by the prince-bishops, and from 1864 to 1867 by the deposed King Otto of Greece. Noteworthy among the monuments of the town is the Maximilian fountain (1880), with statues of Maximilian I. of Bavaria, the emperor Henry II. and his wife, Conrad III. and St. Otto, bishop of Bamberg. At a short distance from the town is the Altenburg (1266 ft.), a castle occupied from 1251 onwards by the bishops of Bamberg. It was destroyed in 1553 by Albert, margrave of Brandenburg, but has been partly restored. The schools include the lyceum for philosophy and Catholic theology (a survival of the university suppressed in 1803), a seminary, two gymnasia, a Realschule, and several technical schools, including one for porcelain-painting. The industries of the town include cotton spinning and weaving, silk spinning, the manufacture of tobacco, ropes, metal-ware, furniture, &c. The market gardens of the neighbourhood are famous, and there is a considerable shipping trade by the river and the Ludwigkanal.

Bamberg, first mentioned in 902, grew up by the castle (Babenburch) which gave its name to the Babenberg family (q.v.). On their extinction it passed to the Saxon house, and in 1007 the emperor Henry II. founded the see. From the middle of the 13th century onwards the bishops were princes of the Empire. The see was secularized in 1802 and in 1803 assigned to Bavaria.

A brief history of the bishopric is given in the Catholic Encyclopedia (London and New York, 1909), with bibliography. For general and special works on the town Ulyse Chevalier, Topo-bibliographie (Montbéliard, 1804-1809), s. v.

BAMBERGER, LUDWIG (1823-1899), German economist and politician, was born of Jewish parents on the 22nd of July 1823 at Mainz. After studying at Giessen, Heidelberg and Göttingen, he entered on the practice of the law. When the revolution of 1848 broke out he took an active part as one of the leaders of the republican party in his native city, both as popular orator and as editor of one of the local papers. In 1849 he took part in the republican rising in the Palatinate and Baden; on the restoration of order he was condemned to death, but he had escaped to Switzerland. The next years he spent in exile, at first in London, then in Holland; in 1852 he went to Paris, where, by means of political connections, he received an appointment in the bank of Bischoffheim & Goldschmidt, of which he became managing director, a post which he held till 1866. During these years he saved a competence and gained a thorough acquaintance with the theory and practice of finance. This he put to account when the amnesty of 1866 enabled him to return to Germany. He was elected a member of the Reichstag, where he joined the National Liberal party, for like many other exiles he was willing to accept the results of Bismarck's work. In 1868 he published a short life of Bismarck in French, with the object of producing a better understanding of German affairs, and in 1870, owing to his intimate acquaintance with France and with finance, he was summoned by Bismarck to Versailles to help in the discussion of terms of peace. In the German Reichstag he was the leading authority on matters of finance and economics, as well as a clear and persuasive speaker, and it was chiefly owing to him that a gold currency was adopted and that the German Imperial Bank took its present form; in his later years he wrote and spoke strongly against bimetallism. He was the leader of the free trade party, and after 1875 refused to follow Bismarck in the new policy of protection, state socialism and colonial development; in a celebrated speech he declared that the day on which it was introduced was a dies nefastus for Germany. True to his free trade principles he and a number of followers left the National Liberal party and formed the so-called "Secession" in 1880. He was one of the few prominent politicians who consistently maintained the struggle against state socialism on the one hand and democratic socialism on the other. In 1892 he retired from political life and died in 1899. Bamberger was a clear and attractive writer and was a frequent contributor on political and economic questions to the Nation and other periodicals. His most important works are those on the currency, on the French war-indemnity, his criticism of socialism and his apology for the Secession.

An edition of his collected works (including the French life of Bismarck) was published in 1894 in five volumes. After his death in 1899 appeared a volume of reminiscences, which, though it does not extend beyond 1866, gives an interesting picture of his share in the revolution of 1848, and of his life in Paris. (J. W. H.)

BAMBINO, IL (Ital. for "the Babe"), the name given in art to the image of the infant Jesus in swaddling clothes common in Roman Catholic churches. The most famous is the miracleworking Santissimo Bambino in the church of Ara Coeli at Rome, the festival of which is celebrated on the feast of the Epiphany (January 6).

BAMBOO, the popular name for a tribe of grasses, Bambuseae, which are large, often tree-like, with woody stems. The stems spring from an underground root-stock and are often crowded to form dense clumps; the largest species reach 120 ft. in height. The slender stem is hollow, and, as generally in grasses, has well-marked joints or nodes, at which the cavity is closed by a strong diaphragm. The branches are numerous and in some species spiny; the narrow, often short, leaf-blade is usually jointed at the base and has a short stalk, by which it is attached to the long sheath. The spikelets are usually many-flowered and variously arranged in racemes or panicles. The flower differs from that of the majority of grasses in having usually three lodicules and six stamens. Many species bloom annually, but others only at intervals sometimes of many years, when the individuals of one and the same species are found in bloom over large areas. Thus on the west coast of India the simultaneous blooming of Bambusa arundinacea (fig. 1), one of the largest species, has been observed at intervals of thirty-two years. After ripening of the seed, the leafless flowering culms always die down.

The Bambuseae contain twenty-three genera and occur throughout the tropical zone, but very unevenly distributed; they also extend into the sub-tropical and even into the temperate zone. Tropical Asia is richest in species; in Africa there are very few. In Asia they extend into Japan and to 10,000 ft. or more on the
Himalayas; and in the Andes of South America they reach the snow-line.

The fruit in *Bambusa*, *Arundinaria* and other genera resembles the grain generally characteristic of grasses, but in *Dendrocalamus* and others it is a nut, while rarely, as in *Melocanna*, it is fleshy and suggests an apple in size and appearance. The uses to which all the parts and products of the bamboo are applied in Oriental countries are almost endless. The soft and succulent shoots, when just beginning to spring, are cut off and served up at table like asparagus. Like that vegetable, also, they are earthed over to keep them longer fit for consumption; and they afford a continuous supply during the whole year, though it is more abundant in autumn. They are also salted and eaten with rice, prepared in the form of pickles or candied and preserved in sugar. As the plant grows older, a species of fluid is secreted in the hollow joints, in which a concrete substance once highly valued in the East for its medicinal qualities, called *ixoax* or *tabsheer*, is gradually developed. This substance, which has been found to be a purely siliceous concretion, is possessed of peculiar optical properties. As a medicinal agent the bamboo is entirely inert, and it has never been received into the European materia medica.

The grains of the bamboo are available for food, and the Chinese have a proverb that it produces seed more abundantly in years when the rice crop fails, which means, probably, that in times of dearth the natives look more after such a source of food. The Hindus eat it mixed with honey as a delicacy, equal quantities being put into a hollow joint, coated externally with clay, and thus roasted over a fire. The fleshy fruit of *Melocanna* is baked and eaten. The plant is native of India, but is sometimes cultivated as in Mauritius. It is, however, the stem of the bamboo which is applied to the greatest variety of uses. Joints of sufficient size form water buckets; smaller ones are used as bottles, and among the Dyaks of Borneo they are employed as cooking vessels. Bamboo is extensively used as a timber wood, and houses are frequently made entirely out of the products of the plant. Sometimes complete sections of the stem form posts or columns; split up, it serves for floors or rafters; and, interwoven in lattice-work, it is employed for the sides of rooms, admitting light and air. The roof is sometimes of bamboo solely, and when split, which is accomplished with the greatest ease, it can be formed into laths or planks. It is employed in shipping of all kinds; some of the strongest plants are selected for masts of boats of moderate size, and the masts of larger vessels are sometimes formed by the union of several bamboos built up and joined together.

The bamboo is employed in the construction of all kinds of agricultural and domestic implements and in the materials and implements required in fishery. Bows are made of it by the union of two pieces with many bands; and, the septa being bored out and the lengths joined together, it is employed, as we use leaden pipes, in transmitting water to reservoirs or gardens. From the light and slender stalks shafts for arrows are obtained; and in the south-west of Asia there is a certain species of equally slender growth, from which writing-pens or reeds are made. A joint forms a holder for papers or pens, and it was in a joint of bamboo that silk-worm eggs were carried from China to Constantinople during the reign of Justinian. The outer cuticle of Oriental species is so hard that it forms a sharp and durable cutting edge, and it is so siliceous that it can be used as a whetstone. This outer cuticle, cut into thin strips, is one of the most durable and beautiful materials for basket-making, and both in China and Japan it is largely so employed. Strips are also woven into cages, chairs, beds and other articles of furniture, Oriental wicker-work in bamboo being unequalled for beauty and neatness of workmanship. In China the interior portions of the stem are beaten into a pulp and used for the manufacture of the finer varieties of paper. Bamboos are imported to a considerable extent into Europe for the use of basket-makers, and for umbrellas and walking-sticks. In short, the purposes to which the bamboo is applicable are almost endless, and well justify the opinion that “it is one of the most wonderful and most beautiful productions of the tropics, and one of Nature's most valuable gifts to uncivilized man” (A. R. Wallace, *The Malay Archipelago*).

A number of species of bamboo are hardy under cultivation in the British Isles. A useful and interesting account of these and their cultivation will be found in the Bamboo Garden, by A. B. Freeman-Mitford. They are mostly natives of China and Japan and belong to the genera *Arundinaria*, *Bambusa* and *Phyllostachys*; but include a few Himalayan species of *Arundinaria*. They may be propagated by seed (though owing to the rare occurrence of fruit, this method is seldom applicable), by division and by cuttings. They are described as hungry plants which well repay generous treatment, and will flourish in a rich, not too stiff loam, and for the first year or two should be well mulched. They should be sheltered from winds and well watered during the growing period. When transplanting the roots must be disturbed as little as possible. The following may be mentioned; *Arundinaria simoni*, a fine plant which in the bamboo garden at Kew has reached 18 ft. in height, and not infrequently flowers and fruits in Britain; *A. japonica*, a tall and handsome plant generally grown in gardens under the name *Bambusa mokake*; *A. niida*, “by far the daintiest and most attractive of all its genus, and remarkably hard;” *Bambusa palmata*, with leaves a foot or more long and three inches broad; *B. tessellata*; *B. quadrangularis*, remarkable for its square stems; *Phyllostachys mitis*, growing to 60 ft. high in its native home, China and Japan; and *P. nigra*, so called from the black stem, a handsome species.

**BAMBRUGH**, or **BAMBOOROUGH**, a village in the Berwick-upon-Tweed parliamentary division of Northumberland, England, on the sea-coast, 2¾ m. E. of Berfield station on the North Eastern railway, and 54 m. N. of Newcastle. It was a royal borough previous to the Norman Conquest and returned two members to parliament in the reign of Edward I. Its ancient castle occupies a magnificent position close to the sea on an almost perpendicular rock, 150 ft. in height, accessible only on the south-east side. The castle is described by the Saxon chronicler to King I. of Northumberland. The castle buildings are of various dates from the Norman period and are of great strength and dignity. They include a massive keep and the remains of an apsidal chapel dedicated to St Peter. In the village, the church is dedicated to St Aidan, who was bishop of Lindisfarne or Holy Island, which lies off the coast to the north, about 6½ m. It is a fine cruciform building, mainly of Early English date, with a crypt beneath the chancel. In the churchyard is a monument to Grace Darling (1815–1842), the brave rescuer of some of the crew of the ship “Forfarshire” in 1838. The Longstone Lighthouse, where her father was keeper, stands on an outer rock of the Farne Islands, which stretch north-eastward for 6 m. from the coast at Bamburgh.

The town of Bamburgh (Bebbanborough) sprang up round the ancient castle. During the struggle for the crown between William Rufus and Robert of Normandy, Bamburgh was besieged by William, who, finding the defence too strong, erected and garrisoned a new castle before Bamburgh called...

again have been a bridgeless building number.

They been a casting of the Indian Caucasus now called Koh-i-Baba. The passes on the Kabul side are not less than 17,000 and 17,000 ft. in absolute height, and those immediately to the north but little inferior. The height of the valley was fixed at about 830 ft., and the surrounding country carefully surveyed by Major Felham J. Maitland and the Hon. M. G. Talbot, during the progress of the Russo-Afghan Boundary Commission in November 1885. The river draining the valley is one of the chief sources of the Sarkhab (Surkhob) or Aksarai, an important tributary of the Upper Oxus.

The prominences of the cliffs which line the valley are crowned by the remains of numerous massive towers, whilst their precipitous faces are for 6 or 7 m. pierced by an infinity of ancient cave-dwellings, some of which are still occupied. The actual site of the old city is marked by mounds and remains of walls, and on an isolated rock in the middle of the valley are considerable ruins of what appears to have been the acropolis, now known to the people as Ghulgulah. But the most famous remains at Bamian are two colossal standing idols, carved in the cliffs on the north side of the valley. They are 173 ft. and 120 ft. high respectively. These images, which have been much injured, apparently by cannon-shot, are cut in niches in the rock, and both images and niches have been coated with stucco. There is an inscription, not yet interpreted, over the greater idol, and on each side of its niche are staircases leading to a chamber near the head, which shows traces of elaborate ornamentation in azure and gilding. These chambers are used by the amir as store-houses for grain. The surface of the niches also has been painted with figures. In one of the branch valleys is a similar colossal, somewhat inferior in size to the second of these two; and there are indications of other niches and idols. Chahibquirrel, 28 m. from Zari, on the road to Balkh by the Balkah, at the east end of the Sokhtagi valley; Shahri-Babur, about 45 m. above Chahibquirrel; and Gawargin, 6 m. above Shahri-Babur, are all fortified sites of about the same age as the relics at Bamian. At Haibak there is a very perfect excavation called the Takhit-Rustam (a general name for all incomprehensible constructions amongst the modern inhabitants of Afghan Turkestan), which consists of an annular ditch enclosing a platform, with a small house about 21 ft. square above it, all cut out of the solid rock. There are hundreds of caves in this neighbourhood, all pointing to a line of Buddhist occupation connecting Balkh with Kabul. As seen from the rock of Ghulgulah, Bamian, with its ruined towers, its colossi, its innumerable grottos, and with the singular red colour of its barren soil, presents an impressive aspect of desolation and mystery.

That the idols of Bamian, about which so many conjectures have been uttered, were Buddhist figures, is ascertained from the narrative of the Chinese pilgrim, Hsiian-Tsang, who saw them in their splendour in a.D. 630, and was verified by the officers above named, who discovered other Buddhist caves and excavations in the valleys of the Balkah and Sarikol.
Still vaster than these was a recumbent figure, 2 m. east of Bamian, representing Sakya Buddha entering Nirvāṇa, i.e. in act of death. This was about 1000 ft. in length. No traces of this are alluded to by modern travellers, but in all likelihood it was only formed of rubble plastered (as is the case still with such Nirvāṇa figures in Indo-China) and of no durability. For a city so notable Bamian has a very obscure history. It does not seem possible to identify it with any city in classical geography: "Alexandria ad Caucasum" it certainly was not. The first known mention of it seems to be that by Hsuan-Tsang, at a time when apparently it had already passed its meridian, and was the head of one of the small states into which the empire of the White Huns had broken up. At a later period Bamian was for half a century, ending a.D. 1214, the seat of a branch of the Chori dynasty, ruling over Tokharistan, or the basin of the Upper Oxus. The place was long besieged, and finally annihilated (1222) by Jenghiz Khan, whose wrath was exasperated at the death of a favourite grandson by an arrow from its walls. There appears to be no further record of Bamian as a city; but the character of ruins at Ghulghulah agrees with traditions on the spot in indicating that the city must have been rebuilt after the time of the Mongols and again perished. In 1840, during the British occupation of Kabul, Bamian was the scene of an action in which Colonel H. W. James with a small force defeated Dost Mohammed Khan, accompanied by a number of Uzbeg chiefs.

BAMPTON, JOHN (c. 1690–1751), English divine, was a member of Trinity College, Oxford, where he graduated M.A. in 1712, and for some time chaplain to Salisbury. He died on the 2nd of June 1751, aged 61. His will directs that eight lectures shall be delivered annually at Oxford in the University Church on as many Sunday mornings in full term, "between the commencement of the last month in Lent term and the end of the third week in Act term, upon either of the following subjects:—to confirm and establish the Christian faith, and to confute all heretics and schismatics; upon the divine authority of the Holy Scriptures; upon the authority of the writings of the primitive fathers, as to the faith and practice of the primitive Church; upon the divinity of our Lord and Saviour Jesus Christ; upon the doctrine of the Holy Ghost; and the last things, and the Christian faith as comprehended in the Apostles' and Nicene Creeds." The lecturer, who must be at least a Master of Arts of Oxford or Cambridge, was formerly chosen yearly by the heads of colleges, on the fourth Tuesday in Easter term, and no one can be chosen a second time. The series of lectures began in 1780, and is still continued, though since 1805 elections are only made in alternate years through a deprivation of the revenue of the fund. The endowment provides £100 for each lecturer, and the lectures have to be published within two months of their delivery. Among the lecturers have been Heber in 1815 (The Personality and Office of the Christian Comforter); R. Whately in 1822 (Party Feeling in Religion); R. D. Hampden in 1832 (The Scholastic Philosophy in relation to Christian Theology); E. M. Goulburn in 1850 (The Resurrection of the Body); H. L. Mansel in 1858 (The Limits of Religious Thought); H. P. Liddon in 1866 (The Divinity of our Lord); E. Hatch in 1880 (The Organization of the Early Christian Churches); C. Bigg in 1886 (Christian Platonists of Alexandria); C. Gore in 1891 (The Incarnation); W. Sanday in 1893 (Inspirations); J. R. Illingworth in 1894 (Personality, Human and Divine); L. Linge in 1897 (Christian Mysticism), &c. A complete list is given in the Oxford Biographical Register. The institution has done much to preserve a high standard in English theology; and the lectures as a whole form a historically interesting collection of apologetical literature.

BAMPU, a town of Persia, in the province of Baluchistan, 330 m. S.E. of Kerman, in 25° 12' N., 60° 24' E., at an elevation of 1720 ft. Pop. about 2000. It is the capital of the province and situated on the banks of the Bampur river which flows from east to west and empties itself about 70 m. W. into a homun, or depression, 50 m. in length, and called Jaz-morían. The old citadel of Bampur which crowned an elevation above 100 ft. in height, 3 m. north of the river, having completely fallen in ruins, a new fort called Kalah Nisser, was built at Fahraj, 15 m. further east, in the eighties; and Fahraj, which now has a population of about 2500, has become more important than Bampur. Fahraj, which is also known as Pahura, Pahuru, is, by some identified as the Pora where Alexander the Great halted on his march from India, but others are more in favour of another Fahraj near Bam, or even of Bampur itself.

BAMRA, a feudatory state of India, in the province of Bengal. Area 1988 sq. m.; pop. (1901) 133,738; estimated revenue £5000; tribute £100. Most of the country is forest, producing only timber and lac but said to be rich in iron ore. The northern border is touched by the Bengal-Nagpur railway, with a station at Bamra town. The state is one of the five Uriya feudatories, which were transferred from the Central Provinces to Bengal, on the reconstitution of that province in October 1905. The capital is Deogah.

BAN, a word taken from the roots of a verb common to many Teutonic languages and meaning originally "to proclaim" or "to announce." The Late Lat. form of the word is bannum.

In the laws of the Franks and kindred tribes the word had three main uses: first, in the general sense of a proclamation, such as the issuing of a decree; secondly, for discrediting such proclamation, and thirdly for the district over which proclamations were issued. It was the frequent use of proclamations or bans, commanding or forbidding certain actions under a threat of punishment, which caused the second of these uses to arise out of the first, as the idea of wrong-doing became associated with the proclamation or ban. This bannum dominicum, as it was called, was employed by all feudal lords, from the king downwards, against offenders, and played an important part in the administration of justice in feudal times. It usually took the form of an order to make some amend for wrong-doing, which, if not complied with, was followed by the withdrawal of all protection from the offender, i.e. by outlawry.

After the break-up of the Carolingian empire another use of the word arose in France. "Ban" had occasionally been used in a restricted sense referring only to the summons calling out the host; and as France became separated from the Empire, French law and custom seized upon this use, and soon the men liable to military service were known as "the ban." A variant form of the word was herban or ariban, and it is possible that some confusion has arisen from the early syllables of the word arrière led to a distinction between the ban and the arrière-ban or retro-banum. At all events this distinction arose; the ban referring to the vassals called out by the king, and the arrière-ban to the sub-vassals called upon by the vassals in their turn. As in England, the liability to military service was often commuted for a monetary payment, and there were various exemptions. In the 17th and 18th centuries the ban and arrière-ban were lacking in discipline when called out, and were last summoned in 1758. Local levies, however, called out between this date and the Revolution were sometimes referred to by these names.

In the medieval Empire and in Germany the word "ban" retained the special sense of punishment. The German equivalent of ban is Acht, and the sentence soon became practically one of outlawry.

Connected possibly with the power enjoyed in earlier times by the assemblies of freemen of outlawing an offender, it was frequently used by the emperor, or German king, and the phrase "under the ban" is very common in medieval history. The execution of this sentence of placing an offender under the imperial ban, or Reichsacht, was usually entrusted to some prince or nobleman who was often rewarded with a portion of the outlaw's lands. It was, however, only a serious punishment when the king or his supporters were strong enough to enforce its execution. Employed not only against individuals but also against towns and districts, it was sometimes divided into the Acht and the Oberacht, i.e. partial or complete outlawry. Documents of the time show that the person placed under the imperial ban drew down absolute destitution upon his relatives and frequently death upon himself. At first this sentence was the act of the
emperor or king himself, but as the Empire became more German, and its administration less personal, it was entrusted to the imperial aulic council (Reichskratz), and to the imperial court of justice or imperial chamber (Reichskammergericht). These courts were deprived of this power in 1711, retaining only the right of suggesting its use. The imperial ban had, however, been used for the last time in 1706, when Maximilian Emanuel, elector of Bavaria, was placed under it.

There are many other uses of the word in the sense of a prohibition. In earlier French law the ban of wine or bonum vinii, was the exclusive right of a lord to sell wine during a stated number of days, and the ban of March and April forbade the pasturing of cattle in certain fields during these months. There were also other similar uses dating from feudal times. In modern French law the phrase rupture de ban described, previous to 1885, the departure without notice of any released criminal living under the special surveillance of the police. The French government still retains the rights of appointing an obligatory place of residence for any criminal, and any escape from this place is a rupture de ban. A Scandinavian use of the word gives it the sense of a curse. This usage mingles with the use which speaks of the departure of some person (formerly banished) or their dependents, has become in a special sense ecclesiastical, and the sentence of excommunication is frequently referred to as "under the papal ban." The word is also used in this way by Shakespeare and Milton. The modern English use of the phrase "under the ban" refers to any line of conduct condemned by custom or public opinion. In its earlier and general sense as a proclamation, the ban may be said to have been suspended by the writ. The word, however, survives in the sense of a proclamation in the "banns of marriage" (q.v.).

The Persian word ban, meaning lord or master, was brought into Europe by the Avars. It was long used in many parts of south-eastern Europe, especially in southern Hungary, to denote the governors of military districts called banats, and is almost equivalent to the German margrave. After enjoying very extensive powers the banats were gradually reduced, both in numbers and importance. Since 1868, however, the governor of Croatia and Slavonia has been known as the ban of Croatia, Slavonia and Dalmatia, but his duties are civil and not military. He is appointed by the emperor in accordance with the Act of 1775, and has a seat in the upper house of the Hungarian parliament.

BANANA, a gigantic herbaceous plant belonging to the genus Musa (nat. ord. Musaceae). It is perennial, sending up from an underground root-stock an apparent stem 15 or 20 ft. high, consisting of the closely-enveloped leaf-sheaths, the corresponding blades, each sometimes 10 ft. in length, forming a spreading crown. A true stem develops at the flowering period; it grows up through the hollow tube formed by the sheaths, emerges above and bears a large number of inconspicuous tubular flowers closely crowded in the axils of large, often brightly-coloured, protecting bracts. The fruits form dense clusters.

The genus Musa contains about 40 species, widely distributed throughout the tropics of the Old World, and in some cases introduced into the New World. In many parts of the tropics they are of great importance to the inhabitants as are the grain plants to those living in cooler regions. They are most successfully cultivated in a hot, damp, tropical climate. The northern limit of their cultivation (usually Musa Cavendishii) is reached in Florida, south of 20° lat., the Canary Islands, Egypt and south Japan, the southern limit in Natal and south Brazil. There has been considerable discussion as to whether the banana was growing in America before the discovery of the New World. It has been suggested that it may have been carried by ocean currents or in some earlier intercourse between the Old and New Worlds. The evidence, however, of its existence in America at the time of the discovery of the new continent is not very definite. The unripe fruit is rich in starch, which in ripening changes into sugar. The most generally used fruits are derived from Musa paradisiaca, of which an enormous number of varieties and forms exist in cultivation. The sub-species sapientum (formerly regarded as a distinct species M. sapientum) is the source of the fruits generally known in England as bananas, and eaten raw, while the name plantain is given to forms of the species itself M. paradisiaca, which require cooking. The species is probably a native of India and southern Asia. Other species which are used as fruits are M. acuminata in the Malay Archipelago, M. Feki in Tahiti, and M. Cavendishii, the so-called Chinese banana, in cooler countries; the fruit of the last-named has a thinner rind and a delicate, fragrant flesh. The species, the fruits of which require cooking, are of much greater importance as an article of food. When the fruit is left to reach a considerable size; forms are known in East Africa which attain nearly 2 ft. in length with the thickness of a man's arm. A form of M. coriacea, from Cochín China and the Malay Archipelago, produces only a single fruit, which, however, affords an adequate meal for three men. The hardly-ripe fruit is stewed whole or cut in slices and roasted or baked.

Banana-meal is an important food-stuff; the fruit is peeled and cut in strips, which are then dried and pounded in a mortar. In East Africa and elsewhere, an intoxicating drink is prepared from the fruit. The root-stock which bears the leaves is, just before the flowering period, soft and full of starch, and is sometimes used as food, as in the case of the Abyssinian species, M. Ensete.

The leaves cut in strips are plaited to form mats and bags; they are also largely used for packing and the finer ones for basketry. The species yield a valuable fibre, the best of which is "Manila hemp" (q.v.) from M. textilis.

The following is the composition of the flour, according to Hutchison: water, 13%; protein, 4%; fat, 0·5%; carbohydrates, 80%; salts, 2·5%. It would require about eighty bananas of average size to yield the amount of energy required daily, and about double that number to yield the necessary amount of protein. Hence the undue abdominal development of those who live mainly on this article of diet (Hutchison). In recent years the cultivation of the banana in Jamaica for the American and also for the English market has been greatly developed.

BANAS, or BUNAS, the name of three rivers of India. (1) A river of Rajputana, which rises in the Aravalli range in Udaipur, drains the Udaipur valley, and after a course of 300 m. flows into the Chambal. (2) A river of the Shahabad district of Bengal, which forms the drainage channel between the Arah canal and the Sone canals system, and finally falls into the Ganges. (3) A river of Chota Nagpur in Bengal, which rises in the state of Chhang Bhakar and falls into the Son near Rampur.

BANAT (Hungarian Banád), a district in the south-east of Hungary, consisting of the counties of Torontó, Temes and Krasso-Szörény. The term, in Hungarian, means generally a frontier province governed by a ban and is equivalent to the German term Mark. There were in Hungary several banats, which disappeared during the Turkish wars, as the banat of Dalmatia, of Slavonia, of Bosnia and of Croatia. But when the word is used without any other qualification, it indicates the Temesvár banat, which strangely acquired this title after the peace of Passarowitz (1718), though it was never governed by a ban. The Banat is bounded E. by the Transylvanian Alps, S. by the Danube, W. by the Theiss and N. by the Maros, and has an
area of 11,260 sq. m. It is mountainous in the south and southeast, while in the north, west and south-west it is flat and in some places marshy. The climate, except in the marshy parts, is generally healthy. It is well-watered, and forms one of the most fertile districts of Hungary. Wheat, barley, oats, rye, maize, flax, hemp and tobacco are grown in large quantities, and the products of the vineyards are of a good quality. Game is plentiful and the rivers swim with fish. The mineral wealth is great, including copper, tin, lead, zinc, iron and especially coal. Amongst its numerous mineral springs, the most important are those of Mehadia, with sulphuriferous waters, which were already known in the Roman period as the Thracian Hercules. The Banat had in 1900 a population of 1,431,320 inhabitants. According to nationality there were 578,789 Rumanians, 352,487 Germans, 251,938 Servians and 170,124 Magyars. The chief town is Temesvár (pop. 53,033), and other places of importance are Versce (25,199), Lugos (16,126), Nagybecserek (26,407), Nagykíkina (24,843) and Puncsóvá (19,044).

The Banat was conquered by the Turks in 1552, and remained a Turkish sanjak (province) till 1716, when Prince Eugene of Savoy liberated it from the Turkish yoke. It received the title of Banat after the peace of Passarowitz (1718), and remained under the Austrian administration until 1751, when Marie Theresa introduced a civil administration. During the Turkish occupation the district was nearly depopulated, and allowed to lie almost desolate in marsh and heath and forest. Count Claudius Mercy (1666–1734), who was appointed governor of Temesvár in 1726, took numerous measures for the regeneration of the Banat. The marshes near the Danube and Theiss were cleared, roads and canals were built at great expense of labour, German artisans and other settlers were attracted to colonize the district, and agriculture and trade encouraged. Maria Theresa also took a great interest in the Banat, colonized the land belonging to the crown with German peasants, founded many villages, encouraged the exploitation of the mineral wealth of the country, and generally developed the measures introduced by Mercy. In 1779 the Banat was again incorporated with Hungary. After the revolution of 1848–1849, the Banat together with another county (Bács) was separated from Hungary, and created into a distinctive Austrian crown land, and in 1860 it was definitely incorporated with Hungary.

Adolph Böh, Geschichte des Temeser Banats (2 vols., Leipzig, 1861); Johann Heinrich Schwicker, Geschichte des Temeser Banats ( Pest, 1872).

BANATE (a corruption of Panaitii, their real name), or Banoc, as they are now usually called, a tribe of North American Indians of Shoshonean stock. They were sometimes known as “Robber Indians.” Their former range was southern Idaho and eastern Oregon. They are now divided between the Fort Hall and Lemhi reservations, Idaho. They were generally friendly with the whites, but in 1866 and in 1877–78 there were serious outbreaks. They number about 500.

BANBRIDGE, a town of Co. Down, Ireland, in the west parliamentary division, on the Ban, 23 m. S.W. of Belfast on a branch of the Great Northern railway, standing on an eminence. Pop. of urban district (1901) 5006. To mitigate a steep ascent, a long, stone-walled embankment, 600 feet long, is cut along the main street to a depth of 15 ft., the opposite terraces being connected by a bridge. Banbridge is an entirely modern town. It is the principal seat of the linen trade in the county, and has extensive cloth and thread factories, bleachfields and chemical works. A memorial in Church Square commemorates the Franklin expedition to the discovery of the North-West Passage, and in particular Captain Francis Crozier, who was born at Banbridge in 1796 and served on the expedition.

BANBURY, a market-town and municipal borough in the Banbury parliamentary division of Oxfordshire, England, on the river Cherwell and the Oxford canal, 86 m. N.W. of London by the northern line of the Great Western railway. Pop. (1901) 12,908. The canal communicates northward with the Grand Junction and Warwick canals, and there are branch lines of the Great Central railway to the main line at Woodford, and of the London & North-Western railway to Bletchley. The town is the centre of a rich agricultural district, and there is a large manufacture of agricultural implements; while other industries include rope and leather works and brewing. Banbury cakes, consisting of a case of pastry containing a mixture of currants, have a reputation of three centuries’ standing. A magnificent Gothic parish church was destroyed by fire and gunpowder in 1790 to make way for a building of little merit in Italian style. The ancient Banbury Cross, celebrated in a familiar nursery rhyme, was destroyed by Puritans in 1610. During the 17th century the inhabitants of Banbury seem to have been zealous Puritans, and are frequently satirized by contemporary dramatists. At a somewhat earlier period the grammar school, now extinct, was of such repute as to be chosen as the model for the constitution of the school of St Paul’s. A school of science was erected in 1861, and there is a municipal secondary and technical school. Some fine old timbered houses remain in the streets. Of the castle built in 1125 there are only the least traces. Wroxton Abbey, 2 m. N.W., shows slight remains of the original Augustinian priory; but the present beautiful gabled building, picturesquely situated, dates mainly from 1616. Broughton Castle, 2½ m. S.W., is the most noteworthy house in the county. The oblong block of the old gate-house, carefully preserved, is a memorial and is protected by a gate-house, part of which dates from 1301, at which date the chapel and a part of the house were also built. There is also work of the 15th century and the Elizabethan period. The house is the seat of Lord Saye and Sele, having been in the Fiennes family since the reign of Henry VII. (1485–1509). Here Pym and Hampden and other leaders of the Parliamentarians were wont to meet in 1640. Without the gate is a fine Decorated church. Banbury is governed by a mayor, 6 aldermen and 18 councillors. Area, 4633 acres.

In the year 556 Banbury (Beranbyrig, Banesberie) was the scene of a battle between Cynric and Cæswin and Britons. It was assessed at 50 hides in the Domesday survey and was then held by the bishop of Lincoln. Allusions to the market occur as early as 1138, and Henry II. by charter confirmed a market on Thursday and granted a fair at Whitsun. The first charter of incorporation was granted by Queen Mary in 1553, and instituted a common council consisting of a bailiff, 12 aldermen and 12 chief burgesses; a court of record, one justice of the peace, a Thursday market and two annual fairs. In 1583 James I. added an annuity of £10. In 1608, with some additions, including a wool-market, a horse-market and two additional annual fairs. Both these charters were surrendered in 1683 in favour of a new charter, but were resumed in 1688. In 1718 George I. granted a new charter, which held until the Municipal Corporations Act of 1835. From the date of Queen Mary’s charter until the Redistribution of Seats Act of 1885 the borough was represented by one member in parliament.

See Alfred Breesley, History of Banbury (London, 1841). BANCHIERI, ADRIANO (c. 1557–1634), Bolognese composer for church and stage, organist, writer on music and poet. He founded the Accademia Florida of Bologna. Like Orazio Vecchi he was interested in converting the madrigal to dramatic purposes. He is distinguished by the modernity of his music, and by the naturalness of his verse, and by a great energy, which even in his later years enabled him to write a large number of church works in the style of Palestrina, and to produce works for the stage, which are now rarely heard. His two most important works are his Operis musicales splendidissimi, published in 1612, and his Orationes, published in 1613. His other works include his Modera Practice Musicale (Venice, 1613), while systematizing the legitimate use of the monodic art of baso-rough. BANCROFT, GEORGE (1800–1891), American historian and statesman, was born in Worcester, Mass., on the 3rd of October 1800. His family had been in America since 1632, and his father, Aaron Bancroft, was distinguished as a revolutionary soldier, clergyman and author. The son was educated at Phillips Academy, Exeter, at Harvard University, at Heidelberg, Göttingen and Berlin. At Göttingen he studied Plato with Heeren, New Testament Greek with Eichhorn and natural science with Blumenbach. His heart was in the work of Heeren, easily the greatest of historical critics then living, and the forerunner of the modern school; it was from this master that Bancroft caught his enthusiasm for minute pains-taking erudition. He concluded his years of preparation by a European tour, in the
course of which he received kind attention from almost every distinguished man in the world of letters, science and art; among others, from Goethe, Humboldt, Schleiermacher, Hegel, Byron, Nichuhr, Bunsen, Savigny, Cousin, Constant and Manzoni. Bancroft's father was a Unitarian, and he had devoted his son to the work of the ministry; but the young man's first experiments at preaching, shortly after his return from Europe in 1822, were unsatisfactory, the theological teaching of the time having substituted criticism and literature for faith. His first position was that of tutor in Harvard. Instinctively a humanist, he had little patience with the narrow curriculum of Harvard in his day and the rather pedantic spirit with which classical studies were there pursued. Moreover, he had brought from Europe a new manner, full of the affections of ardent youth, and this he wore without ease in a society highly satisfied with itself; the young knight-errant was therefore subjected to considerable ridicule. A little volume of poetry, translations and original pieces, published in 1823 gave its author no fame. As time passed, and custom created familiarity, his style, personal and literary, was seen to be the outward symbol of a firm resolve to preserve a philosophic calm, and of an enormous underlying energy which spent itself in labour, "ohne Hast, aber auch ohne Rast." He found the conventional atmosphere of Cambridge uncongenial, and with a friend he established the Round Hill school at Northampton, Mass. This was the first serious effort made in the United States to elevate secondary education to the plane on which it belonged.

Although born into a Whig family, yst Bancroft's studies carried him irresistibly into the Democratic party. Why a teacher in his own school he was elected to the state legislature as a Democrat, but under pressure from the family of his first wife, who were ardent Whigs, he refused to serve. In 1831 he likewise declined the nomination of the Massachusetts Democrats for secretary of state. For this time he was influential in the councils of his party, and President Van Buren appointed him collector of the port of Boston, a position which he filled with success. To his new calling he was fitted by his studies; there were Orestes Brownson and Nathaniel Hawthorne. In 1834 he was the Democratic candidate for the governorship, but he was defeated. In 1845 he entered Polk's cabinet as secretary of the navy, serving until 1846, when for a month he was acting secretary of war. During this short period in the cabinet he established the naval academy at Annapolis, gave the orders which led to the occupation of California, and sent Zachary Taylor into the debatable land between Texas and Mexico. He also continued his pleadings for the annexation of Texas, as extending "the area of freedom," and though a Democrat, took high moral ground as to slavery; he likewise made himself the authority on the North-Western Boundary question. In 1846 he was sent as minister to London, where he lived in constant companionship with Macaulay and Hallam. On his return in 1849 he withdrew from public life, residing in New York. In 1866 he was chosen by Congress to deliver the spurious poetry of the jnformational in 1867 he was appointed minister to Berlin, where he remained until his resignation in 1874. Thenceforward he lived in Washington and Newport, dying at Washington on the 17th of January 1891. His latest official achievements were the greatest. In the San Juan arbitration he displayed great versatility and skill, winning his case before the emperor with brilliant ease. The naturalization treaties which he negotiated successively with Prussia and the other north German states were the first international recognition of the right of expatriation, a principle since incorporated in the law of nations.

In spite of the exciting and severe routine of the Round Hill school, Bancroft contributed frequently to the North American Review and to Walsh's American Quarterly; he also made a translation of Heren's work on The Politics of Ancient Greece. In 1834 appeared the first volume of the History of the United States. The second followed in 1837, and others as the exigencies of public life permitted. Supplementary to the first volume was an article published by him in the North American Review for 1835 on "The Documentary History of the Revolution." This article not merely brought the new method to the notice of the reading public, but revealed to it the wealth of material available. The nature and extent of his studies, the solidity of his work, and the philosophic spirit which animates both, explain the enthusiasm with which the earlier volumes of Bancroft were received. Their sale at home was very large; they were reprinted in England and translated immediately into Danish, Italian, German and French. The latest volumes were considered by all competent judges quite as important as their predecessors. When the author was preparing to return from Berlin, the Royal Academy made him their guest at a public dinner, an unprecedented honour; and the universities of Berlin, Heidelberg and Munich united in a testimonial of regard. At Washington he was the confidential advisor of statesmen to the end of his life and the unofficial dean of the best society. Bancroft's historical creed is best set forth in the address he delivered on the semi-centennial of the New York Historical Society in 1854. In philosophy he found the basis for positing a collective human will, revealing in its activities the materials for determining ethical laws. Since there must be the same conservation of energy in morals as elsewhere, the eternal reason is the divine Logos. History, therefore, is God working in examples. It must be a unit, its forces constant and its totality an organic whole. Within this the individual moves and acts with liberty and responsibility, for each, in will, affection and intellect is consubstantial with the rest. Truth, morals and justice are subject to no evolution; but the collective man evolves better forms of knowledge and behaviour. The organization of society, therefore, produces successive states, in each of which the principle of freedom is better established than in the antecedent. Permanency in republican government is, therefore, based upon corresponding experience and culture, and its possibilities grow ever stronger. The relation of American democracy to the systems which have preceded it forms the latest proof of these contentions. As Heeren's pupil, he laid enormous stress on the importance of original authorities. In dealing with documentary evidence he sought to apply very stringent rules—(1) Carefully distinguish between original authority and historical memorials or aids; for example, between a fact recorded at first-hand or second-hand knowledge, and a decision of principle by authority. (2) Represent every man from his own standpoint; judge him from your own. His collections of original materials were vast; beginning with his residence in England, he brought together at enormous pains and expense the authenticated copies of archives, family papers, and personal journals written by historic personages, which now constitute an invaluable treasure in the New York public library. They are from every land and from every people with which American origins are connected. His use of this material was not always according to accepted standards. To avoid dryness and prolixity he condensed quotations, and occasionally employed the Thucydidean method of abridgment or representation in place of fact catalogues. During his long life enormous strides were made by others in collecting the materials of American history, and while in the main he kept pace with them by ruthless revision, yet his latest edition of his work disregards some minor facts which others knew for the insertion of much which the author alone knew. Bancroft's imagination and enthusiasm were alike exuberant. His pages abound in fine and acute insight. His generalizations are vivid and enlightening. He spared no pains to acquire true style, frequently rewriting his chapters, and sometimes testing passages of philosophy and description in eight different forms. Yet to a certain extent he lacked the representative power and often failed to conceal his art, many pages ringing with artificial tones. But, after making all allowances, it remains true that he had a perfect sense of proportion, sound maxims and thorough common-sense. He was of that greatest human type: a man of the present, valuing justly the past and no dreamer. In the nature and extent of his studies, in the solidity of his work, and in the philosophic spirit which animated his life he ranks as the foremost historian of the United States, and as an American historian second to none of his European contemporaries
the same line. He displayed the heroic, epic value of American history, its unity with the great central stream, and dispelled for ever the extravagant conceptions of a sentimental world just emerging from the visionary philosophy of the 18th century.

See M. A. de Wolfe Howe, The Life and Letters of George Bancroft (New York, 1898). (W. M. S.)

BANCROFT, HUBERT HOWE (1832— ), American historical writer, was born at Granville, Ohio, on the 5th of May 1832. From 1838 to 1852 he was a bookseller in San Francisco. During this period he accumulated a great library of historical material, and at last gave up business in order to devote himself to the publication of his Native Races of the Pacific States (5 vols. 1874-1876), History of the Pacific States of North America (21 vols. 1882-1890), and other works. For the collection of data he necessarily relied upon the labours of a corps of assistants, and the publications named represent, properly speaking, an encyclopaedia rather than a unified history; but as a storehouse of material their value is great and is likely to be enduring. In 1903 Bancroft's vast collection was acquired by the university of California. An account of his methods of work is given in his Reminiscences (1893).

BANCROFT, RICHARD (1544-1610), archbishop of Canterbury, was born at Farnworth in Lancashire in 1544. He was educated at Cambridge, first at Christ's College and afterwards at Jesus College. He took his degree of B.A. in 1567 and that of M.A. in 1570. Ordained about that time, he was named chaplain to Richard Cox, then bishop of Ely, and in 1575 was presented to the rectory of Teversham in Cambridgeshire. The next year he was one of the preachers to the university, and in 1584 was presented to the rectory of St Andrew's, Holborn. His abilities, and his zeal as a champion of the church, secured him rapid promotion. He graduated B.D. in 1580 and D.D. five years later. In 1583 he was appointed treasurer of St Paul's cathedral, London, and in 1586 was made a member of the ecclesiastical commission. On the 9th of February 1589 he preached at Paul's Cross a sermon on 1 John iv. 1, the substance of which was a passionate attack on the Puritans. He described their speeches and proceedings, caricatured their motives, denounced the exercise of the right of private judgment, and set forth the divine right of bishops in such strong language that one of the queen's council was afraid to amount to a threat against the supremacy of the crown. In the following year Bancroft was made a prebendary of St Paul's; he had been canon of Westminster since 1587. He was chaplain successively to Lord Chancellor Hatton and Archbishop Whitgift. In June 1597 he was consecrated bishop of London; and from this time, in consequence of the age and incapacity for business of Archbishop Whitgift, he was virtually invested with the power of primate, and had the sole management of ecclesiastical affairs. Among the more noteworthy cases which fell under his direction were the proceedings against "Martin Mar-Prelate," Thomas Cartwright and his friends, and John Penry, whose "seditionous writings" he caused to be intercepted and given up to the lord keeper. In 1600 he was sent on an embassy, with others, to Embden, for the purpose of settling certain matters in dispute between the English and the Danes. This mission, however, failed. Bancroft was present at the death of Queen Elizabeth. He took a prominent and turbulent part in the famous conference of prelates and Presbyterian divines held at Hampton Court in 1601. By the king's desire he undertook the vindication of the practices of confirmation, absolutism, private baptism and lay excommunication; he urged, but in vain, the reinforcement of an ancient canon, "that schismatics are not to be heard against bishops"; and in opposition to the Puritans' demand for certain alterations in doctrine and discipline, he besought the king that care might be taken for a praying clergy; and that, till men of learning and sufficient gifts could be found, godly homilies might be read and their number increased. In March 1604 Bancroft, on Whitgift's death, was appointed by royal writ president of conviction then assembled; and he there presented a book of canons collected by himself. It was adopted and received the royal approval, but was strongly opposed and set aside by parliament two months afterwards. In the following November he was elected successor to Whitgift in the see of Canterbury. He continued to show the same zeal and severity as before, and with so much success that Lord Clarendon, writing in his praise, expressed the opinion that "if Bancroft had lived, he would quickly have extinguished all that fire in England which had been kindled at Geneva." He was as lenient with the offences of the orthodox as he was rigid in suppressing heresy and schism. In 1605 he was sworn a member of the privy council. The same year he engaged in a contest with the judges, and exhibited articles of complaint against them before the lords of the council; but these complaints were overruled. His aim was really to make the ecclesiastical courts independent of the law by speciously magnifying the royal authority over them. He enforced discipline and exact conformity within the church with an iron hand; and over 200 clergymen were deprived of their livings for disobedience to the ex animo form of subscription. In 1608 he was chosen chancellor of the university of Oxford. One of his latest public acts was a proposal laid before parliament for improving the revenues of the church, and a project for a college of controversial divinity at Chelsea. In the last few months of his life he had part in the discussion about the consecration of certain Scottish bishops; but in pursuance of his policy that they were consecrated by several bishops of the English church. By this act were laid the foundations of the Scottish Episcopal church. Bancroft was "the chief overseer" of the authorized version of the Bible. He died at Lambeth Palace on the 2nd of November 1610. His literary remains are not extensive, but show him to have been an able writer.

BANCROFT, SIR SQUIRE (1841— ), English actor and manager, was born near London on the 14th of May 1841. His first appearance on the stage was in 1861 at Birmingham, and he played in the provinces with success for several years. His first London appearance was in 1865 in Wooler's A Winning Hazard at the Prince of Wales's theatre off Tottenham Court Road, then under the management of Effie Marie Wilton (b. 1840), whom he married in 1868. Mr and Mrs Bancroft were associated in the production of all the Robertson comedies:—Society (1863), Ours (1866), Caste (1867), Play (1868), School (1869) and M.P. (1870), and, after Robertson's death, in revivals of the old plays. The couple were an admirable company. Lytton's Money (1873), Boucicault's London Assurance (1877), and Diplomacy—an adaptation of Sardou's Dora—were among their premières, which helped to make the little playhouse famous. The Bancroft management at the Prince of Wales's constituted a new era in the development of the English stage, and had the effect of reviving the London interest in modern drama. In 1879 they moved to the Haymarket, where Sardou's Odette (for which they engaged Madame Modjeska) and Pédora, W. S. Gilbert's Sweethearts and Pinoero's Lords and Commons, with revivals of previous successes, were among their productions. Having made a considerable fortune, they retired in 1885, but Mr Bancroft (who was knighted in 1897) joined Sir Henry Irving in 1889 to play the abbe Latour in a revival of Watts Phillips's Dead Heart.

See Mr and Mrs Bancroft, on and off the Stage (1888), and The Bancroft: Recollections of Sixty Years (1909), by themselves.

BAND, something which "binds" or fastens one thing to another, hence a cord, rope or tie, e.g. the straps fastening the sheets to the back in book-binding. The word is a variant of "bond," and is from the stem of the Teutonic bindan, to bind. From the same source comes "bend," properly to fasten the string to the bow, so as to constrain and curve it, hence to make into the shape of a "bent" bow, to curve. In the sense of "strap," a flat strip of material, properly for fastening anything, the word is ultimately of the same origin but comes directly into English from the French bande. In architecture the term is applied to a sort of flat frieze or fascia running horizontally round a tower or other parts of a building, particularly the base tables in perpendicular work, commonly used with the long shafts characteristic of the 13th century. It generally has a bold, projecting moulding above and below, and is carved
sometimes with foliages, but in general with cusped circles or quatrefoils, in which frequently are shields of arms.

The two small strips of linen, worn at the neck as part of legal, clerical and academic dress, are known as “bands”; they are the survival of the falling collar of the 17th century. These bands are usually of white linen, but the secular clergy of the Roman Church wear black bands edged with white. The light cardboard or chip boxes now used to carry millinery were formerly made to carry the neck-bands, whence the name of “band-box.”

In the sense of company or troop, “band” is probably also connected with bindan, to bind. It came into English from the French. The meaning seems to have originated in Romanaic, cf. Italian, Spanish and Portuguese banda, and thence came into Teutonic. It has usually been taken (see Ducange, Gloss. s.v. banda) to be due to the “band” or sash of a particular colour worn as a distinctive mark by a troop of soldiers. Others refer it to the medieval Latin bandum, banner, a strip or “band” of cloth fastened to a pole. In this sense the chief application is to a company of musicians (see ORCHESTRA), particularly when used in armies or navies, a military band.

**Military Bands.**—In all countries bands are organized and maintained in each infantry regiment or battalion if the latter is the unit. The strength of these bands and the number and nature of their instruments vary considerably, so that the rank and status of the bandleader. The buglers and drummers belonging to the companies are generally massed under the serjeant-drummer and on the march play alternately with the band. In action the British custom is to use the bandmen as stretcher-bearers, but on the continent of Europe the bands are as far as possible kept in hand under the regimental commanders and play the troops into action; and in all countries the available bands, drums and bugles are ordered to play during the final assault. The training of bandmasters for the British service is carried out at Kneller Hall, Hounslow, an institution founded in 1857 and placed under direct control of the war office in 1867. The average strength of the various classes of instrument in the band of a British line regiment has been stated as twenty flutes, oboes, clarinets and bassoons, four horns, eight saxhorns, six trumpets and cornets, three trombones, two drums. The buglers and drummers are in the proportion of one of each per company. The saxophone, which is the characteristic instrument of military bands in other countries, has not found favour with the British authorities. Another skillfully military instrument, universal in the Roman Catholic and Russian armies, or less commonly in the English army, is the well-known "jingling nutmeg," a frame of small bells that is sharply shaken in the accentuated parts of the music. The "glockenspiel" is also fairly common. The peculiar instrument of Scottish regiments is the bagpipes. Cavalry, and more rarely artillery corps in the various armies, have small bands. The mounted arms, however, have little need of music as compared with the infantry, the order and ease of whose marching powers are immensely enhanced by the music of a good regimental band. In the navies of various countries bands are maintained on board flag-ships and sometimes on board other large ships.

**Banda**, a town and district of British India, in the Allabaad division of the United Provinces. The town is near the right bank of the river Ken, 95 m. S. W. of Allahabad. The population in 1901 was 22,595. The town possesses 65 mosques and 168 Hindu temples. It was formerly, but is no longer, a military cantonnement.

The district is the most barren and backward portion of the province. It contains an area of 3061 sq. m. In some parts it rises into irregular uplands and elevated plains, interspersed with detached rocks of granite; in others it sinks into marshy lowlands, which frequently remain under water during the rainy season. The sloping country on the bank of the Jumna is full of ravines. To the S.E. the Vindhyâ chain of hills takes its origin in a low range not exceeding 500 ft. in height, and forming a natural boundary of the district in that direction. The principal river of the district is the Jumna, which flows from north-west to south-east, along the N.E. boundary of the district, for 125 m. In 1901 the population was 631,058, showing a decrease of 13% in the decade, due to the effects of famine. The black soil of the district yields crops of which the principal are rice, cotton and oil-seeds. Banda cotton enjoys a high repute in the market. A branch railway from Manikpur to Jhansi traverses the length of the district, which is also crossed by the East Indian main line to Jubbulpore.

Banda, which forms one of the districts included under the general name of Bundelkhand, has formed an arena of contention for the successive races who have struggled for the sovereignty of India. Kalinjar town, then the capital, was unsuccessfully besieged by Mahmud of Ghazni in A.D. 1025; in 1196 it was taken by Kutub-ud-din, the general of Muhammad Ghor; in 1545 by Shere Shah, who, however, fell mortally wounded in the assault. About the year 1735 the raja of Kalinjar's territory, including the present district of Banda, was bequeathed to Baji Rao, the Mahratta peshwa; and from the Mahrattas it passed by the treaties of 1802-1803 to the Company. At the time of the Mutiny the district, which was poverty-stricken and over-tax ed, joined the rebels. The town of Banda was recovered by General Whitchlock on the 20th of April 1858. The fiscal system was remodelled, and the district has since enjoyed a general prosperity, and the population is considerably increased.

**BANDA ISLANDS**, a group of the Dutch East Indies, consisting of three chief and several lesser islands in the Banda Sea, south of Ceram, belonging to the residency of Amboyna. The main islands are Great Banda or Lontor; Banda Neira to its north; Gunong Api, west of Banda Neira; Wai or Ai still farther west, with Run on its south-west; Pisang, north of Gunong Api; and Suwangi, north-west again. The total land area is about 16 sq. m. A volcanic formation is apparent in Lontor, a sickle-shaped island which, with Neira and Gunong Api, forms part of the circle of a crater. The arrangement is comparable with Antarin in the Aegean Sea. Gunong Api (Fire Mountain), 2200 ft. high, is an active volcano, and its eruptions and earthquakes have frequently brought destruction, as notably in 1852, when the damage was chiefly due to a huge wave of the sea. Banda, the chief town, on Neira, is a pleasant settlement, commanded by two Dutch forts of the early 17th century, Nassau and Belgica. The largest island, Lontor, was found too unhealthy to be the site of the principal settlement; but the climate of the islands generally, though hot, is not unhealthy. In the space between Lontor, Neira and Gunong Api there is a good harbour, with a sideway to enter either of the monsoons. Between Gunong Api and Neira there is a third channel, but it is navigable for small vessels only. The principal articles of commerce in the Banda group are nutmegs and mace. The nutmeg is indigenous. The native population having been cleared off by the Dutch, the plantations were worked by slaves and convicts till the emancipation of 1860. The introduction of Malay and Chinese labourers subsequently took place. The plantations (perken) were originally held by the conquerors of the natives, the government monopolizing the produce at a fixed rate; but in 1873 the government monopoly was abolished. The production amounts annually to nearly 1,500,000 lb of nutmegs, and 350,000 lb of mace. The nutmegs are grown, in accordance with natural conditions, under the shade of other trees, usually the canari. Jali or jatti wood is cultivated on the small island of Rosingen. The total population of the islands is about 9500, of which some 7500 are descendants of the natives introduced as slaves from neighbouring islands, and are Christians or Mahomedans.

The Banda Islands were discovered and annexed by the Portuguese Antonio de Abreu in 1512; but in the beginning of the 17th century his countrymen were expelled by the Dutch. In 1608 the British built a factory on Wai, which was demolished by the Dutch as soon as the English vessel left. Shortly after, however, Banda Neira and Lontor were resigned by the natives to the British, and in 1620 Run and Wai were added to their dominions; but in spite of treaties into which they had entered
the Dutch attacked and expelled their British rivals. In 1654 they were compelled by Cromwell to restore Run, and to make satisfaction for the massacre of Amboyna; but the English settlers not being adequately supported from home, the island was retaken by the Dutch in 1664. They remained in undisputed possession until 1796, when the Bande Islands were taken by the British. They were restored by the treaty of Amiens in the year 1800, again captured, and finally restored by the treaty of Paris concluded in 1814.

**BANDANA, or BANDANNA, a word probably derived through the Portuguese from the Hindustani bándhá, which signified a primitive method of obtaining an effect in dyeing by tying up cloth in different places to prevent the particular parts from receiving the dye. The name was given to richly coloured silk handkerchiefs produced by this process, of which bright colours were characteristic. Bandanas are now commonly made of cotton and produced in Lancashire, whence they are exported. The effect is also produced by a regular process in calico printing, in which the pattern is made by discharging the colour.**

**BANDELLER, ADOLPH FRANCIS ALPHONSE (1840—1934),** American archaeologist, was born in Bern, Switzerland, on the 6th of August 1840. When a youth he emigrated to the United States. After 1858 he devoted himself to archaeological and ethnological work among the Indians of the south-western United States, Mexico and South America. Beginning his studies in Sonora (Mexico), Arizona and New Mexico, he made himself the leading authority on the history of this region, and— with F. H. Cushing and his successors—one of the leading authorities on its prehistoric civilization. In 1882 he abandoned this field for Ecuador, Bolivia and Peru, where he continued ethnological, archaeological and historical investigations. In the first field he was in a part of his work connected with the Hemenway Archaeological Expedition and in the second worked for Henry Villard of New York, and for the American Museum of Natural History of the same city. Bandeller has shown the falsity of various historical myths, notably in his conclusions respecting the Inca civilization of Peru. His publications include: three studies "On the Art of War and Mode of Warfare of the Ancient Mexicans,” “On the Distribution and Tenure of Lands and the Customs with respect to Inheritance among the Ancient Mexicans,” and "On the Social Organization and Mode of Government of the Ancient Mexicans” (Harvard University, Peabody Museum of American Archaeology and Ethnology, Annual Reports, 1877, 1878, 1879; Historical Introduction to the Ruins of the Pueblo of Pecos (1881); Report of an Archaeological Tour in Mexico in 1881 (1884); Final Report of Investigations among the Indians of the South-western United States (1890— 1892, 2 vols.); Contributions to the History of the South-western Portion of the United States carried on mainly in the years from 1880 to 1885 (1890),—all these in the Papers of the Archaeological Institute of America, American Series, constituting vols. i.—v.; "The Romantic School of American Archaeologists” (New York Historical Society, 1885); The Gilded Man (El Dorado) and other Pictures of the Spanish Occupancy of America (1893); and a report On the Relative Antiquity of Ancient Persian Burials (American Museum of Natural History, Bulletin, v. 30, 1904). He also edited The Journey of Alvar Nuñez Cabeza de Vaca . . . from Florida to the Pacific, 1528—1536 (1905), translated into English by his wife.

**BANDELLO, MATTEO (1480—1562),** Italian novelist, was born at Castelnuovo, near Tortona, about the year 1480. He received a very careful education, and entered the church, though he does not seem to have prosecuted his career with much zeal. For many years he resided at Mantua, and superintended the education of the celebrated Lucrezia Gonzaga, in whose honour he composed a long poem. The decisive battle of Pavia, which gave Lombardy into the hands of the emperor, compelled Bandello to fly; his house at Milan was burnt and his property confiscated. He took refuge with Cesare Fregoso, an Italian general in the French service, whom he accompanied into France. In 1550 he was raised to the bishopric of Agen, a town in which he resided for many years before his death in 1562. Bandello wrote a number of poems, but his fame rests entirely upon his extensive collection of Novelle, or tales (1554, 1573), which have been extremely popular. They belong to that species of literature of which Boccaccio's Decameron and the queen of Navarre's Heptameron are, perhaps, the best known examples. The common origin of them all is to be found in the old French fabliaux, though some well-known tales are evidently Eastern, and others classical. Bandello's novels are esteemed the best of those written in imitation of the Decameron, though Italian critics find fault with them for negligence and inattention of style. They have little value from a purely literary point of view, and many of them are disfigured by the grossest obscenity. Historically, however, they are of no little interest, not only from the insight into the social life of the period which they afford, but from the important influence they exercised on the Elizabethan drama. The stories on which Shakespeare based several of his plays were supplied by Bandello, probably through Bellforest or Paynter.

**BANDER ABBASI (also Bender Abbas, and other forms),** a town of Persia, on the northern shore of the Persian Gulf in 27° 11' N., and 56° 17' E., forming part of the administrative division of the "Persian Gulf ports," whose governor resides at Bushire. It has a population of about 10,000, an insalubrious climate and had never before been visited. Bandari was called Gombrun (Gomboon, Gamaroon; Cambarco, Comorao of Portuguese writers) until 1622, when it received its present name (the "port of Abbas") in honour of the reigning shah Abbas I., who had expelled the Portuguese in 1614, and destroyed the fort built by them in 1612. The English, however, were permitted to build a factory there, and about 1620 the Dutch obtained the same privilege. On the capture of the island of Hormuz (Ormus) in 1622 by the English and Persians a large portion of its trade was transferred to Bandar Abbas. During the remainder of the 17th century the traffic was considerable, but in the 18th prosperity declined and most of the trade was removed to Bushire. In 1759 the English factory was destroyed by the French, and though afterwards re-established it has long been abandoned. The ruins of the factory and other buildings lie west of the present town. About 1740 Nadir Shah granted the town and district with the fort of Shamli and the town of Minab, together with the islands of Kishm, Hormuz (Ormus) and Tastap, to the Arab tribe the Bander Mams in return for a payment of a yearly rent or tribute. About 40 years later Sultan bin Ahmad, the ruler of Muscat, having been appealed to for aid by the Arab inhabitants of the place against Persian misrule, occupied the town, and obtained a firman from the Persian government confirming him in his possession on the condition of his paying a yearly rent of a few thousand tomans. The islands were considered to be the property of Muscat. In 1852 the Persians expelled the Muscat authorities from Bander Abbas and its district, but retired when Muscat agreed to pay an increased rent. By a treaty concluded between Persia and Muscat in 1856 it was stipulated that Bander Abbas town and district and the islands were to be considered Persian territory and leased to Muscat at an annual rent of 14,000 tomans (6000). The treaty was to have been in force for twenty years, but in 1866 the Persians took advantage of the assassination of Seyed Thuweini, the sultan of Muscat, to instal as governor of Bander Abbas and district a nominee of their own who would agree to pay the old rent of 20,000 tomans per year. Further differences arising between Persia and Muscat, and the ruler of the latter, then in possession of a powerful fleet, threatening to blockade Bander Abbas, the Persian government solicited the good offices of the British government, and the lease was renewed for another eight years upon payment of 30,000 tomans per annum (then about 1200). This was in 1868. In the same year, however, the sultan of Muscat was expelled by a successful revolt, and the Persian government, in virtue of a clause in the lease allowing them to cancel the contract if a conqueror obtained possession of Muscat, installed their own governor at Bandar Abbas and
have retained possession of the place ever since (see Curzon, Persia, ii. 424).

Bander Abbasi has a lively trade, exporting much of the produce of central and south-eastern Persia and supplying imports to those districts and Khorasan. It has telegraph and post offices, and the mail steamers of the British India Steam Navigation Company call at the port weekly. Great Britain and Russia are represented there by consuls. From 1890-1905 the total value of the exports and imports from and into Bander Abbasi averaged about £600,000 per annum, £260,000 (£155,000 British) being for exports, £400,000 (£340,000 British) imports. Of the 255,000 tons of shipping which in 1905 entered Bander Abbasi 237,000 were British.

(B. H. S.)

BANDER LINGAH, or LINGA, a town of Persia on the northern shore of the Persian Gulf and about 300 m. by sea from Bushire, in 26° 33' N., 54° 54' E. Pop. about 10,000. It forms part of the administrative divisions of the "Persian Gulf ports," whose governor resides at Bushire. The annual value of the exports and imports from and into Bander Lingah from 1890 to 1905 averaged about £800,000, but nearly half of that amount is represented by pearls which pass in transit from the fisheries of the Arab coast to Bombay. Like many other Persian Gulf ports, Bander Lingah was for many generations a hereditary patrimony of the Sheik of an Arab tribe, in this case the Juvasmi tribe, and it was only in 1808 that the Arabs were expelled from the place by a Persian force. It is the chief port for the Persian province of Luristan (under Fars), and has a thriving trade with Bahrein and the Arab coast. It has a British post office, and the steamers of the British India Company call there weekly. Of the 133,000 tons of shipping which in 1905 entered the port 104,500 were British.

BANDEROLE (Fr. for a "little banner"), a small flag or streamer carried on the lance of a knight, or flying from the mast-head of a ship in battle, &c.; in heraldry, a streamer hanging from beneath the crosier of a bishop's crosier and folding over the staff; in architecture, a band used in decorative sculpture of the Renaissance period for bearing an inscription, &c. Bannerol, in its main uses the same as banderole, is the term especially applied to the square banners carried at the funerals of great men and placed over the tomb.

BANDICOOT, any animal of the marsupial genus Perameles, which is the type of a family Peramelidae. The species, about a dozen in number, are widely distributed over Australia, Tasmania, New Guinea and several of the adjacent islands. They are of small size and live entirely on the ground, making nests of dried leaves, grass and sticks in hollow places and forming burrows in which they pass a great part of the day. Though feeding largely on worms and insects they ravage gardens and fields, on which account they are detested by the colonists. The name is often extended to the family.

BANDICOOT-RAT, the Anglo-Indian name for a large rat (Nesokia bandicota), inhabiting India and Ceylon, which measures from 12 to 15 in. to the root of the tail, while the tail itself measures from 11 to 13 in. The name is said to be a corruption of the Telegu pondi-hoku. It differs from typical rats of the genus Mus by its broader incisors, and the less distinct cusps on the molar bone. Other species of the genus are found from Palestine to Formosa, as well as in central Asia. The typical species frequents villages, towns and cultivated grounds all over India and Ceylon, but is specially common in the south of the peninsula. (See Rodentia.)

BANDIERA, ATILIO (1811-1844) and EMILIO (1816-1842), Italian patriots. The brothers Bandiera, sons of Baron Bandiera, an admiral in the Austrian navy, were themselves members of that service, but at an early age they were won over to the ideas of Italian freedom and unity, and corresponded with Giuseppe Mazzini and other members of the Giovane Italia (Young Italy), a patriotic and revolutionary secret society. During the year 1843 the air was full of conspiracies, and various ill-starred attempts at rising against the Italian despots were made. The Bandieras began to make propaganda among the officers and men of the Austrian navy; nearly all Italians, and actually planned to seize a warship and bombard Messina. But having been betrayed they fled to Corfu early in 1844. Rumours reached them there of agitation in the Neapolitan kingdom, where the people were represented as ready to rise en masse at the first appearance of a leader; the Bandieras, encouraged by Mazzini, consequently determined to make a raid on the Calabrian coast. They got together a band of about twenty men ready to sacrifice their lives for an idea, and set sail on their desperate venture on the 12th of June 1844. Four days later they landed near Cotrone, intending to go to Cosenza, liberate the political prisoners and issue their proclamations. But they did not find the insurgent band which they had been told awaited them, and were betrayed by one of their party, the Corsican Boccheclamie, and by some peasants who believed them to be Turkish pirates. A detachment of gendarmes and volunteers was sent against them, and after a short fight the whole band were taken prisoners and escorted to Cosenza, where a number of Calabrians who had taken part in a previous rising were also under arrest. First the Calabrians were tried by court-martial, and a large number condemned to death or the galleys. The raiders' turn came next, and the whole party, save the traitor Boccheclamie, were condemned to be shot, but in the case of eight of them the sentence was commuted to the galleys. On the 23rd of July the two Bandieras and their nine companions were executed; they cried Viva l'Italia! as they fell.

The Neapolitan government was undoubtedly within its right in executing the Bandieras, and the material results of this heroic but unpractical attempt were nil. But the moral effect was enormous throughout Italy, the action of the authorities was universally condemned, and the martyrdom of the Bandieras bore fruit in subsequent revolutions. It also created a great impression in England, where it was believed that the Bandieras' correspondence with Mazzini (q.v.) had been tampered with, and that information as to the proposed expedition had been forwarded to the Austrian and Neapolitan governments by the British foreign office; recent publications, however, especially the biography of Sir James Graham, tend to exculpate the British government.

See G. Ricciardi, Storia dei Fratelli Bandiera (Florence, 1863); F. Venostra, I Fratelli Bandiera (Milan, 1863); and Carlo Tironini, L'Italia durante il dominio austriaco, vol. iii, p. 149 (Turin, 1894). (L. V. V.)

BANDINELLI, BARTOLOMEO or BACCIO (1493-1560), Florentine sculptor, was the son of an eminent goldsmith, and from him Bandinelli obtained the first elements of drawing. Showing a strong inclination for the fine arts, he was early placed under Rustici, a sculptor, and a friend of Leonardo da Vinci, with whom he made rapid progress. The ruling motive in his life seems to have been jealousy both of Benvenuto Cellini and of Michelangelo, one of whose cartoons he is said to have torn up and destroyed. He is regarded by some as inferior in sculpture only to Michelangelo, with whom a comparison unfavourable to Bandinelli is tempted in such works as the marble colossal group of Hercules and Cacus in the Piazza del Gran Duco, and the group of Adam and Eve in the Bargello. Among his best works must be reckoned the bassi-rilievi in the choir of the cathedral of Florence; his copy of the Laocoön; and the figures of Christ and Nicodemus on his own tomb.

BANDITELLA, ANNA (1726-1800), Italian author, was born at Florence on the 25th of September 1726. Having been left an orphan in his infancy, he was supported by his uncle, Giuseppe Bandini, a lawyer of some note. He received his education among the Jesuits, and showed a special inclination for the study of antiquities. His first work was a dissertation, De VETERUM SALUTATIONIBUS (1746). In 1747 he undertook a journey to Vienna, in company with the bishop of Volterra, to whom he acted in the capacity of secretary. He was introduced to the emperor and took the opportunity of dedicating to that monarch his Specimen Litterarum Florentinae, which was then printing at Florence. On his return he took orders, and settled at Rome, passing the whole of his time in the library of the Vatican, and in those of the cardinals Passionel and Corsini. The famous obelisk
of Augustus, at that time disinterred from the ruins of the Campus Martius, was described by Bandini in a learned folio volume De Odioso Augusti. Shortly after he was compelled to leave Rome on account of his health and returned to Florence, where he was appointed librarian to the valuable library bequeathed to the public by the abbé Marucelli. In 1756 he was preferred by the emperor to a prebend at Florence, and appointed principal librarian to the Laurentian library. During forty-four years he continued to discharge the duties of this situation, and died in 1800, generally esteemed and regretted. On his deathbed he founded a public school, and bequeathed the remainder of his fortune to other charitable purposes. The most important of his numerous works are the Catalogus Cod. MSS. Graec. Lat., Ital., Bib., Laurent., 8 vols (1767-1778), and the Vita e Lettere d'Amorico Vespuci, 1745.

**BANDOLIER,** or **BANDOLEER** (from Fr. bandoleière, Ital. bandoliera, a little band), a belt worn over the shoulder, particularly by soldiers to carry cartridges. In the 17th century wooden cases were hung to the belt to contain powder charges. The modern bandolier carries the cartridges either in loops sewn to the belt, or in small pouches, similarly attached, containing strips of several cartridges. It has been extensively adopted in the British army, especially for mounted troops.

**BANDON,** or **BANDONBRIDGE,** a market-town of county Cork, Ireland, in the south-east parliamentary division, picturesquely situated in a broad open valley on both sides of the river Bandon. Pop. (1901) 2830. It is 20 m. S.W. of the city of Cork by the Cork, Bandon & South Coast railway. It is an important agricultural centre and there are distilleries, breweries and flour-mills. The open park of Castle Bernard (earl of Bandon), on the riverside, is attractive, and 2 m. below Bandon on the river is Innishannon, the head of navigation. Bandon was founded early in the 17th century by Richard Boyle, earl of Cork, and was incorporated by James I. It returned two members to the Irish parliament and thereafter on to the Imperial parliament until 1685. After the destruction of the walls by the Irish in 1680, Bandon long resisted the admission of Catholic inhabitants.

**BANEBERRY,** or **HERB CHRISTOPHER,** popular names for Adoxa epidota (nat. ord. Ranunculaceae), a poisonous herb with long-stalked compound leaves, small white flowers and black berries, found wild in copses in limestone districts in the north of England. It is widely distributed in the north temperate zone.

**BANÉR** (BANNER, BANIER), **JOHN** (1596-1641), Swedish soldier in the Thirty Years' War, was born at Djusholm Castle on the 23rd of June 1596. Entering the Swedish army, he served with distinction in the wars with Russia and Poland, and had reached high rank when, in 1630, Gustavus Adolphus landed in Germany. As one of the king's chief subordinates, Banér served in the campaign of north Germany, and at the first battle of Breitenfeld he led the right wing of Swedish horse. He was present at the taking of Augsburg (1633), and returned with it to the Lech and at Donauwörth. At the unsuccessful assault on Wallenstein's camp at the Alte Veste Banér received a wound, and, soon afterwards, when Gustavus marched towards Lützen, his general was left in command of the force, in which he was opposed to the imperial general Aldringer. Two years later, as Swedish field-marshall, Banér, with 16,000 men, entered Bohemia, and, combined with the Saxen army, marched on Prague. But the complete defeat of Bernhard of Saxe-Weimar in the first battle of Nördlingen stopped his victorious advance. After this event the peace of Prague placed the Swedish army in a very precarious position, but the victories won by the united forces of Banér, Wrangel and Torstensson, at Kyrätz and Wittstock (4th Oct. 1636), restored the paramount influence of Sweden in central Germany. Even the three combined armies, however, were decidedly inferior in force to those they defeated, and, in 1637 Banér was completely defeated, unable to make headway against the enemy. Rescuing with great difficulty the beleaguered garrison of Torgau, he retreated beyond the Oder into Pomerania. In 1639, however, he again overran northern Germany, defeated the Saxons at Chemnitz and invaded Bohemia itself. The winter of 1640-1641 Banér spent in the west. His last achievement was an audacious coup-de-main on the Danube. Breaking camp in mid-winter (a very rare event in the 17th century) he united with the French under the comte de Guébriant and surprised Regensburg, where the diet was sitting. Only the break-up of the ice prevented the capture of the place. Banér thereupon had to retreat to Halberstadt. Here, on the 10th of May 1641, he died, after designating Torstensson as his successor. He was much beloved by his men, who bore his body with them on the field of Wölbhuttel. Banér was regarded as the best of Gustavus's generals, and tempting offers (which he refused) were made by the emperor to induce him to enter his service. His son received the dignity of count.

**BANFF,** a royal, municipal and police burgh, seaport and capital of Banffshire, Scotland. Pop. (1901) 7161. It is beautifully situated on high ground, on the left bank of the mouth of the Deveron, 50 m. N.W. of Aberdeen by the Great North of Scotland railway. It is a place of great antiquity, its first charter having been granted by Malcolm IV. in 1163, and further privileges were conferred by Robert Bruce in 1324 and Robert II. in 1372. Of the old castle on the hill by the sea, in which Archbishop Sharp was born, scarcely a trace remains; but upon its site was erected the modern Banff Castle, belonging to the earl of Seafield. The chief public edifices include the county buildings; town hall, surmounted by a spire 100 ft. high; Chalmers hospital (founded by Alexander Chalmers of Clunie, a merchant and shipowner of the town); a masonic hall of tasteful design; and the academy, a modern structure in the Greek style, to which there is attached an extensive library; the church, the cemetery, the residence of James Ferguson, the astronomer, the house by which originally belonged to the defunct Banff Institution and was afterwards taken over by the town council, Thomas Edward—"the working naturalist," whose life was so sympathetically written by Samuel Smiles—was curator for a few years. The principal manufactures comprise woollens, leather, rope and sails, and there are also breweries, distilleries, iron foundries, brick-yards and timber-yards, besides some ship-building. The fishing trade is also important. The exports mainly consist of grain, cattle, fish, dairy produce and potatoes; the imports of coal and timber. There is a railway station at Bridge of Banff communicating, via Inverness, with Aberdeen, and another at the harbour, communicating with Portsoy and Keith. The burgh is subject to the jurisdiction of a provost and council, and its leading men hold high office in Macduff, Elgin, Cullen, Inverurie, Kintore and Peterhead in returning one member to parliament. The Cassie Giant is the largest bell in Europe, cast by Alexander Cassie of London, and was presented to the town of Banff by the Duke of Macduff by the Duke of Fife in November 1906.

**BANFFSHIRE,** a north-eastern county of Scotland, bounded N. by the Moray Firth, E. and S. by Aberdeenshire, and W. by Elgin and Inverness. It has an area of 403,364 acres, or 633 sq. m. The surface is diversified. The northern half is mostly a fine, open, undulating country of rich, highly-cultivated soil. The southern is more hilly, but extensive fine farms are found in its fertile glens. Some of the mountains are thick with forests, some present a beautiful intercourse of rock and copse, while others are covered with brown heath. The principal mountains are all in the south; among them are Cairngorm, on the confines
of the shires of Banff and Inverness (4084 ft.), famous for its amber-coloured quartz crystals, the “cairngorns” of Scots jewelry; Brougham Hill (2752 ft.); Corryhame (2653); Cook’s Cairn (2478); Carn an t-Saile (2491); and the Buck of Cabrach (2368). No great rivers belong to Banffshire. For a considerable part of their courses the Spey forms the western and the Deveron the eastern boundary of the county. But Banffshire streams are comparatively short, the chief being the Avon, Fiddich, Isla, Buckie, Deskford—with a series of cascades—and Livet. Most of them are stocked with trout and the Spey and Deveron are famous for their salmon. They are distinguished for their romantic scenery, the chief being Glen Avon, Glen Barry, Glen Fiddich, Glen Isla, Glen Livet, and Glen Rinnen. The largest lochs are in the extreme south: Loch Avon (2500 ft. above the sea), Loch Builg (1586) and Loch Etchachan (3100).

Geology.—The geology of Banffshire is closely connected with that of the neighbouring counties of Aberdeen and Elgin, from which it is divided by no natural boundaries. The greater portion is occupied before and after the folding and metamorphism of the strata. Highland sequence. The groups which are typically developed comprise (1) slates, schists and phyllites with thin black limestone, sometimes containing tremolite, (2) the main limestone, (3) the quartzite (Schull); the slates subside towards Cullen and Portsoy southwards by Keith and Dufftown to the head waters of the Avon beyond Tomintoul. Some excellent sections of the phyllites are to be seen on the shore between Sandend, near Portsoy, and New Elgin, near Mullen, west of Keith. The main limestone has been worked at Fordyce, near Grange east of Keith, and at Keith and Dufftown. The quartzite, which is regarded as probably the highest member of the Highland sequence and the most recent rocks of the more intervening hollows. It appears on the coast between Cullen and Buckie, it forms the Durn Hill near Portsoy, the Binn of Cullen, the Knock Hill near Dufftown, and the ridges northwards towards Deveron by Glen Fiddich towards Tomintoul. In the north-east part of the county there is a large development of slate with interbedded greywackes and pebbly grits, which occupies the coast section between Dufftown and Buckie. A curious group of rocks south of Dufftown has been quarried for roofing purposes. No fossils have been found in these strata and their age is uncertain. The metamorphic sediments have been pierced by acid and basic igneous intrusions, partly before and partly after the folding and metamorphism of the strata. The older acid and basic materials appear as sheets injected along the lines of bedding of the sediments and are traceable for considerable distances. They are foliated in places, the planes of schistosity being more or less broken and associated with the basic intrusions. The older acid rocks are represented by the sills of granite and augenite occurring west of Portsoy, south of Fordyce and near Keith, while the older basic rocks are illustrated by the boulder gabbro, epidiorite and hornblende schists which occupy the wooded districts southward of Banff. These beds are brought to light by Rotheniery to Huntly in Aberdeenshire. Veins and bosses of serpentine are associated with these basic intrusions at Portsoy and near Grange, one of the veins being traceable at intervals from the shore southwards in the direction of Knock Hill and Troup Head except a small part at Knock whose rocks have been quarried for roofing purposes. Near Cullen a pierce encounter occurred in 1906, and a sculptured stone at Mortlach is said to commemorate a signal victory gained by Malcolm II. over the Norsemen in 1010. The shire was the scene of much strife after the Reformation. In Glen Livet the Roman Catholic, under the marquis of Huntly, worsted the Protestants under the earl of Argyll. From 1624 to 1645 was a period of almost incessant struggle, and the Covenanting troubles, combined with the frequent conflicts of the clans, were productive of serious evils. But the Jacobite risings of 1715 and 1745 left the county comparatively untouched, and thereafter it became so peaceful.

See W. Cramond, Annals of Banff (New Spalding Club) (Aberdeen, 1891); Dr Gordon, Chronicles of Keith, Grange, &c. (Glasgow, 1880); Banffshire Year-Book (Banff); Professor Dickie, Botanist’s Guide to Aberdeen, Banff, &c. (Aberdeen, 1860); Inventory of Charities of Banff (Banff, 1877); and Inventory of Charities of Banff (Banff, 1877).
BÁNFFY, DEZSŐ [DESIDERIUS], BARON (1843— ), Hungarian statesman, the son of Baron Daniel Bánffy and Anna Gyárlás, was born at Klausenburg on the 28th of October, 1843, and educated at the Berlin and Leipzig universities. As lord lieutenant of the county of Belső-Szolnok, chief captain of Kovár and curator of the Calvinistic church of Transylvania, Bánffy exercised considerable political influence outside parliament from 1875 onwards, but his public career may be said to have begun in 1892, when he became speaker of the house of deputies. As speaker he continued, however, to be a party-man (he had always been a member of the left-centre or government party) and materially assisted the government by his rulings. He was a stringent adversary of the radicals, and caused some sensation by absenting himself from the capital on the occasion of Kossuth’s funeral on the 1st of April, 1894. On the 14th of January, 1895, the king, after the fall of the Széll ministry, entrusted him with the formation of a cabinet. His programme, in brief, was the carrying through of the church reform laws with all due regard to clerical susceptibilities, and the maintenance of the Composition of 1867, whilst fully guaranteeing the predominance of Hungary. He succeeded in carrying the removal of the ministerial bills through the Upper House, despite the vehement opposition of the Széll ministry, to which brought about the fall of Kalnoky, the minister for foreign affairs, but greatly strengthened the ministry in Hungary. In the ensuing elections of 1896 the government won a gigantic majority. The drastic electoral methods of Bánffy had, however, contributed somewhat to this result, and the corrupt practices were the pretext for the fierce opposition in the House which he henceforth had to encounter, though the measures which he now introduced (the Honved Officers Schools Bill) would, in normal circumstances, have been received with general enthusiasm. Bánffy’s resoluteness enabled him to weather all these storms, and his subsequent negotiations with Austria as to the quota and commercial treaties, to the considerable political advantage of Hungary, even enabled him for a time to live at peace with the opposition. But in 1898 the opposition, now animated by personal hatred, took advantage of the ever-increasing difficulties of the government in the negotiations with Austria, and refused to pass the budget till a definite understanding had been arrived at. They refused to be satisfied with the small transaction of the dismissal of Kalnoky, and passion ran so high that on the 3rd of January 1899 Bánffy fought a duel with his most bitter opponent, Horánszky. On the 26th of February Bánffy resigned, to save the country from its “ex-lex”, or unconstitutional condition; he was decorated by the king and received the freedom of the city of Buda. Subsequently he contributed to overthrow the Stephen Tisza administration, and in May 1905 joined the Kossuth ministry.

See article “Bánffy,” by Marczal, in Pallas Nagy Lexikona, Köt. 17.

BANGALORE, a city of India, the capital of the native state of Mysore, and the largest British cantonment in the south of India. It is 3113 ft. above the sea, and 210 m. W. of Madras by rail. Pop. (1901) 69,447. The foundation of the present fort was laid by a descendant of Kempe-Gouve, a husbandman of the neighbouring country, who, probably in the 16th century, had left his native village to avoid the tyranny of the wadeyar of that place, and settled on a spot a few miles to the north of Bangalore. To the peaceful occupation of a farmer he added that of a warrior, and his first exploit was the conquest of this place, where, and at Savendrung, his family subsequently erected fortresses. Bangalore, with other possessions, was, however, wrested from them by Bijapur. Somewhat later we find it enumerated among the jagirs of Shahji, father of Sivaji, the founder of the Mahratta sway; and at an early period of his career in the service of the Bijapur state, that adventurer seemed to have fixed his residence there. It appears to have passed into the possession of Venkaji, one of the sons of Shahji; but he having occupied Tanjore, deemed Bangalore too distant, especially under the circumstances of the times, to be safe. He accordingly, in 1687, entered into a bargain for its sale to Chikka Deva, raja of Mysore, for three lakhs of rupees; but before it could be completed, Kasim Khan, commander of the forces of Aurasanghe, marched upon the place and entered it almost without resistance. This event, however, had no other result than to transfer the stipulated price from one vendor to another; for that general, not coveting the possession, immediately delivered it over to Chikka Deva on payment of the three lakhs. In 1758, Nanjaraj, the powerful minister of the Madras presidency, was sent to Bangalore as a jagir or fief, by Hyder Ali, afterwards usurper of Mysore, who greatly enlarged and strengthened the fort, which, in 1760, on his expulsion from Seringapatam, served as his refuge from destruction. The fort formed the traditional scene of the first captivity of Sir David Baird after Bailie’s defeat at Perambakam in 1780. The prison cell of Sir David and his fellow-captive is from 12 to 15 ft. square, with so low a roof that a man can scarcely stand upright in it. In 1791 it was stormed by a British army commanded by Lord Cornwallis. In 1790 the district was included by the treaty of Seringapatam within the territory of the restored raja of Mysore. It formed the headquarters of the British administration of Mysore from 1831 to 1881. When the state of Mysore was restored to its raja in 1881, the civil and military station of Bangalore was permanently reserved under British jurisdiction as an “assigned tract.” It has an area of 13 sq. m., and had in 1901 a population of 89,590, showing a decrease of 10% in the decade, due to plague. Bangalore is the headquarters of a military district, its elevation rendering it healthy for British troops, who are accommodated in barracks and houses and an arsenal in the old fort. It is the headquarters of a brigade in the 9th division of the Indian army. A considerable number of European pensioners reside here. There is a modern palace for the maharaja. There is an aided Roman Catholic college, besides many schools for Europeans. A permanent water-supply has been introduced and there is a complete system of drainage. Bangalore is an important railway centre. There are several cotton mills. The city suffered severely from plague in 1899 and 1900.

The district of Bangalore borders on the Madras district of Salem. The main portion consists of the valley of the Arkavati river, which joins the Cauvery on the southern frontier. Its area is 3709 sq. m. In 1901 the population was 780,664, showing an increase of 15% in the decade. The district is crossed by several lines of railway. Outside Bangalore city there is a woollen mill, which turns out blankets, cloth for greatcoats, and woollen stuffs.

BANGANAPALLE, a state of southern India, surrounded by the Madras district of Kurnool. Area, 250 sq. m.; pop. (1901) 32,264, showing a decrease of 9% in the decade; estimated revenue £6400, of which a large portion is alienated in grants to junior branches of the family; no tribute. The excessive expenditure of the nawab, Syed Fateh Ali Khan, and the general inefficiency of the administration caused much anxiety to the government, and in February 1905 he was temporarily removed from the administration of the state. The town of Banganapalle is not far from the branch of the Southern Mahratta railway from Guntakal to Bezwa.
BANGASH, a small tribe of Pathans in the Kohat district of the North-West Frontier Province of India. They occupy the hills between Thal and Kohat, and number 4000 fighting men. Formerly they owned the whole of Kurram, but owing to the encroachments of the Turis, they moved eastwards, dispossessed the Orakzais, drove them north and took their territory in the Kohat district, which they now occupy to the west of the Khattak country. The Khattaks and Bangashes are of exceptionally good physique and make excellent soldiers.

BANGKOK, the capital of Siam, on the river Me Nam, about 20 m. from its mouth, in 100° 30' E., 13° 45' N. Until modern times the city was built largely on floating pontoons or on piles at the edges of the innumerable canals and water-courses which formed the thoroughfares, but to meet the requirements of modern life, well-planned roads and streets have been constructed in all directions, crossing the old canals at many points and lined with well-built houses, for the most part of brick, in which the greater part of the erstwhile riparian population now resides. The centre of the city is the royal palace (see Siam), situated in a bend of the river and enclosed by walls. At a radius of nearly a mile is another wall within which lies the closely-packed city proper, and beyond which the town stretches away to the royal park of the King, the only exception to the general rule being the rice-mills, harbour and docks on the south. The whole town covers an area of over 10 sq. m. Two companies provide Bangkok with a complete system of electric tramways, and the streets are lined with shade-trees and lit by electricity. All over the town are scattered beautiful Buddhist temples, which with their coloured tile roofs and gilded spires give it a peculiar and notable appearance. Many fine buildings are to be seen—the various public offices, the arsenal, the mint, the palaces of various princes and, in addition to these, schools, hospitals, markets and Christian churches of many denominations, chiefly Roman Catholic. There are four railway stations in Bangkok, the termini of the lines which connect the provinces with the capital. The climate of Bangkok has without doubt recently changed, it has become hotter and less humid. Though a minimum temperature below 60° F. is still recorded in January and December, a maximum of over 108° is reached during the hot weather months and at the beginning of the rains, whereas up to the year 1900 a maximum of 93° was considered unusually high. The cause of this change is not known, but it is attributed to the drainage and removal of vegetation in the immediate neighbourhood of the town. The annual rainfall amounts to rather over 50 in.

A four-mile reach of the Me Nam, immediately below the city proper, forms the port of Bangkok. From 250 to 400 yds. broad and of good depth right up to the river, the banks afford every convenience for the berthing and loading of ships, though a bar at its mouth, which prevents the passage of vessels drawing more than 12 ft., necessitates in the case of large ships a partial loading and unloading from lighters outside. The banks of the port are closely lined with the offices, warehouses and wharves of commercial houses, with timber yards and innumerable rice-mills, while the custom house, the harbour master's office and many of the foreign legations and consulates are also situated here. Of the 750 steamships which cleared the port in 1904, three out of every seven were German, two were Norwegian and one was British, but in 1905 two new companies, one British and the other Japanese, arranged for regular services to Bangkok, thereby altering these proportions. It is notable that the heavy trade with Singapore shows a tendency to decrease in favour of direct shipping. A fleet of small conscription junks, carrying only trade, still ply between Bangkok and the major rice-consuming towns of the Interior, paying due respect to the topography of the land, but having no fixed course. The trade of Bangkok is almost entirely in the hands of Europeans and Chinese. The principal imports are rice and teak, and the principal exports, cotton and silk goods and gold-leaf. The value of trade, which more than doubled between the years 1900 and 1907, amounted in the latter year to £5,600,000 imports and £7,100,000 exports. Of the total trade, 75% is with the British empire. Many of the best known mercantile firms and banks of the Far East have branches in Bangkok. The unit of currency is the tical (see Siam).

The government of Bangkok is entrusted to the minister of the capital, a member of the cabinet. Under this minister are the police, sanitary, harbour master's and revenue offices. The police force is an efficient and well-organized body of 9000 men headed by a European commissioner of police. The sanitary department consists of a board of health, a bacteriological laboratory and an engineer's office, all managed with expert European assistance. Under the act of 1905, the want of which was long felt, the port and the city water-ways are controlled by the harbour master. Local revenues are collected by the revenue office. The ordinary law courts are under the control of the ministry of justice, but in accordance with the extra-territorial rights enjoyed by foreign powers in Siam, each consulate has attached to it a court, having jurisdiction in all cases in which a subject of the power represented by such consulate is defendant.

The population, which is estimated at 450,000, is mixed. Mingling with Siamese and Chinese, who form the major part, may be seen persons of almost every race to be found between Bombay and Japan, while Europeans of different nationalities number over 1000. The death-rate is high, especially among children, which accounts for the prevalence of cholera, small-pox and fever during the dry weather. Sanitation, however, is improving and much good has resulted from the boring of numerous artesian wells which yield good water.

Before 1760 Bangkok was nothing but an agricultural village with a fort on the river bank. In that year, however, it was seized by the warrior, Paya Tak, as a convenient point from which to attack the Burmese army then in occupation of Siam, and upon his becoming king it was chosen as the capital of the country. (See Siam.)

W. A. G.

BANGOR, a seaport and market-town of Co. Down, Ireland, in the north parliamentary division, on the south side of Belfast Lough, 12 m. F.N.E. of Belfast, on a branch of the Belfast & Down Railway. Pop. of urban district (1901) 5903. It carries on a considerable trade in cotton and linen and embroidered muslin. It is greatly frequented as a watering-place, especially by the people of Belfast, and there are golf links and important regattas held by the Royal Ulster Yacht Club. Slight remains are to be seen of an abbey of Canons Regular, founded in the middle of the 12th century by St Comgall, and rebuilt, on a scale of magnificence, which ascended the Eastern Maine, St. John, and became known, or of the law school of the University of Maine—and of the Bangor Theological Seminary (Congregational), incorporated in 1814, opened at Hampden in 1816, removed to Bangor in 1819, and empowered in 1905 to confer degrees in divinity. The city has several public parks, a public library and various charitable institutions, among which are a children's home, a home for aged men, a home for aged women and a deaconesses' home. Among the principal buildings are the county court house, the Federal building, the city hall and the opera house. The Eastern
BANGOR—BANGWEULU

Maine Musical Festival is held in Bangor in October of each year. The rise of the tide here to a height of 17 ft. makes the Penobscot navigable for large vessels; the Kenduskeag furnishes good water-power, and the city is the trade centre for an extensive agricultural district. The Eastern Maine State Fair is held here annually. Bangor is one of the largest lumber depots in the United States, and also ships considerable quantities of ice. The city's foreign trade is of some importance; in 1907 the imports were valued at $2,730,504, and the exports at $1,272,247. Bangor has various manufactures, the most important of which (other than those dependent upon lumber) are boots and shoes (including moccasins); among others are trunks, valises, saws, stoves, ranges and furnaces, edge tools and cant dogs, saw-mill machinery, brick, clothing, cigars, flour and dairy products. In 1905 the city's factory products were valued at $3,408,355. The municipality owns and operates the water-works (the water-supply being drawn from the Penobscot by the Holly system) and an electric-lighting plant; there is also a large electric-plant for generation of electricity for power and for commercial lighting, and in Bangor and the vicinity there were in 1908 about 60 miles of electric street-railways.

Bangor was first identified by some antiquaries as the site of the mythical city of Norambeaga, and it was reported in 1636 that Fort Norambeaga, built by the French, was standing here; but the authentic history of Bangor begins in 1760 when the first settlers came. The settlement was at first called Conduskeag and for a short time was locally known as Sunbury. In 1791 the town was incorporated, and through the influence of the Rev. Seth Noble, the first pastor, the name was changed to Bangor, the name of one of his favourite hymn-tunes. During the war of 1812 a British force occupied Bangor for several days (in September 1814), destroying vessels and cargoes. Bangor was chartered as a city in 1834. In 1836 a railway from Bangor to Old Town was completed; this was the first railway in the state; Bangor had, also, the first electric street-railway in Maine (1880), and one of the first iron steamships built in America ran to this port and was named "Bangor."

BANGOR (formerly Bangor Fawr, as distinguished from several other towns of this name in Wales, Ireland, Brittany, &c.), a city, municipal (1883) and contributor parliamentary borough (Carnarvonshire, N. Wales), sea-port and market-town of Carnarvonshire, N. Wales, 240 m. N.W. of London by the London & North Western railway. Pop. (1901) 11,269. It consists of Upper and Lower, the Lower practically one street. Lying near the northern entrance of the Menai Straits, it attracts many visitors. Buildings include the small cathedral, disposed bishop's palace, deanery, small Roman Catholic church and other churches, the University College of N. Wales (1883), with female students' hall, Independent, Baptist, Normal and N. Wales Training Colleges. The cruciform cathedral, with a low nunneced tower, stands on the site of a church which the English destroyed in 1071 (dedicated to, and perhaps founded, about 535, by St Deiniol). Sir G. Scott restored the present cathedral, 1866-1875, after it had been burnt in the time of Owen Glendower, destroyed in 1211, and, in 1202 and 1212, severely handled. Bishop Dean (imp. Henry VII.) rebuilt the choir, Bishop Skevington (1532) added tower and nave. Lord Penrhyn's slate-quarries, at Bethesda, 6 m. off, supply the staple export from Port Penrhyn, at the mouth of the stream Ceid. The Myrjavian Archaeology (408-484) gives the three principal bangor (college) institutions as follows—the bangor of Illtud Farchaw at Caer Gworgorn (Wroxeter); that of Emrys (Ambrosius) at Caer Caradog; bangor wydrin (glass) in the glass isle, Affalach; bangor Illtud, or Llanlindir, or Llantwit major (by corruption), being a fourth. In each of the first three were 420 saints, sovereign each other (by hundreds), day and night, in their pious offices.

BANGORIAN CONTROVERSY, a theological dispute in the early 18th century which originated in 1716 with the posthumous publication of George Hickes's (bishop of Thetford) Constitution of the Christian Church, and the Nature and Consequences of Schism, in which he excommunicated all but the non-juring churchmen. Benjamin Hoadly (q.v.), the newly-appointed bishop of Bangor, scented the opportunity and wrote a speedy and able reply, _Preservative against the Principles and Practices of Non-Jurors_, in which his own Erastian position was recommended and sincerity proposed as the only test of truth. This was followed by his famous sermon, preached before George I. on the 31st of March 1717, on _The Nature of the Kingdom or Church of Christ_. In this discourse "he impugned the idea of the existence of any visible church at all, ridiculed the value of any tests of orthodoxy, and poured contempt upon the claims of the church to govern itself by means of the state." He identified the church with the kingdom of Heaven—it was therefore "not of this world," and Christ had not delegated His authority to any representatives. Both book and sermon were reported on by a committee appointed by the Lower House of Convocation in May, and steps would have been taken by the archbishop and bishops had not the government stepped in (Hoadly denied that this was at his request) and proferred Convocation till November. Hoadly himself wrote _A Reply to the Representations of Convocation_ and also answered his principal critics, among whom were Thomas Sherlock (q.v.), John Hoadley (afterward bishop of Chester), Andrew Snape, Robert Watton, and Francis Hare, then dean of Worcester. These three men, and another opponent, Robert Moss, dean of Ely, were deprived of their royal chaplaincies. Hoadly was shrewd enough not to answer the most brilliant, though comparatively unknown, of his antagonists, William Law. Though the controversy went on, its most important result had already been achieved in the silencing of Convocation, for that body, though it had just "seemed to be settling down to its proper work in dealing with the real exigencies of the church" when the Hoadly dispute arose, did not meet again for the despatch of business for nearly a century and a half. (See Convocation.)

BANGWEULU, a shallow lake of British Central Africa, formed by the head streams of the Congo. It lies between 10° 38' and 11° 31' S. and is cut by 30° E. Bangweulu occupies the north-west part of a central basin in an extensive plateau, and is about 3700 ft. above the sea. The land slopes gently to the depression from the south, east, and north, and into it drain a considerable number of streams, turning the greater part into a morass of reeds and papyrus. The term Bangweulu is some times applied to the whole depression, but is properly confined to the area of clear water. Only on its south-west and eastern sides are the banks of the lake clearly defined. The greatest extent of open water is about 60 m. N. to S. and 40 m. E. to W. Long narrow sandbanks almost separate Chifumawuli, the western part of the lake, from the main body of water, while the water surface is further diminished by a number of islands. The largest of these islands, Kirui (chiru), lies on the east side of the lake close to the swamp. Kisi (Chishi) is a small island occupying a central position just south of 15° S., and Mbawalli, 20 m. long by 3 broad, lies south of Kisi. South of Bangweulu the swamp extends to 12° 10' S. Into this swamp on its east side flows the Chambesi, the most remote head stream of the Congo. Without entering the lake the Chambesi mingles its waters in the swamp with those of the Luapula. The Luapula, which leaves Bangweulu at its most southern point, is about a mile wide at the outflow, but soon narrows to 300 or 80 yds. West of the Luapula and near its outflow lies Lake Kambilombo, 20 m. long and 8 m. broad, at the head of Bangweulu. A sandy track separates Lake Kambilombo from Kamplombo, and a narrow forest-clad tongue of land called Kapata intervenes between the Luapula and Kamplombo. Various channels lead, however, from the river to the lake. The Luapula flows south through the swamp some 50 m. and then turns west and afterwards north (see CONGO). The flood waters of the Chambesi and other streams, which deposit large quantities of alluvium, are gradually solidifying the swamp, while the Luapula is believed to be, though very slowly, draining Bangweulu. The waters of the lake do not appear to be anywhere more than 15 ft. deep.

Though heard of by the Portuguese traveller, Francisco de Lacerda, in 1798, Bangweulu was first reached in 1868 by David Livingstone, who died six years later among the swamps to the
south. It was partially surveyed in 1883 by the French traveller, Victor Giraud, and first circumnavigated by Poulett Weathery in 1896.

**BANIM, JOHN** (1798—1842), Irish novelist, sometimes called the "Scott of Ireland," was born at Kilkenny on the 3rd of April 1798. In his thirteenth year he entered Kilkenny College and devoted himself specially to drawing and painting. He pursued his artistic education for two years in the schools connected with the Royal Society at Dublin, and afterwards taught drawing in Kilkenny, where he fell in love with one of his pupils. His affection was returned, but the parents of the young lady interfered and removed her from Kilkenny. She pined away and died in two months. Her death made a deep impression on Banim, whose health suffered severely and permanently. In 1820 he went to Dublin and settled finally to the work of literature. He published a poem, *The Cetis' Paradise*, and his *Damon and Pythias* was performed at Covent Garden in 1821. During a short visit to Kilkenny he married, and in 1822 planned in connection with his elder brother Michael (1796—1824), a series of tales illustrative of Irish life which should show what the Waverley Novels were for Scotland. He then set out for London, and supported himself by writing for magazines and for the stage. A volume of miscellaneous essays was published anonymously in 1824, called *Revelations of the Dead Alive*. In April 1825 appeared the first series of *Tales of the O'Hara Family*, which achieved immediate and decided success. One of the most powerful of them, *Crohoore of the Bill Hook*, was by Michael Banim. In 1826 a second series was published, containing that excellent Irish novel, *The Novulans*. John's health had given way, and the next effort of the "O'Hara family" was almost entirely the production of his brother Michael. *The Croppy*, a *Tale of 1798* (1828) is hardly equal to the earlier tales, though it contains some wonderfully vigorous passages. *The Denounced*, *The Mayor of Windgap*, *The Ghost Hunter* (by Michael Banim), and *The Smuggler* followed in quick succession, and were received with considerable favour. John Banim, meanwhile, had become much straitened in circumstances. In 1829 he went to France, and while he was abroad a movement to relieve his wants was set on foot by the English press, headed by John Sterling in *The Times*. A sufficient sum was obtained to remove him from any danger of actual want, and to this government added in 1836 a pension of £150. He returned to Ireland in 1835, and settled in Windgap Cottage, a short distance from Kilkenny; and there, a complete invalid, he passed the remainder of his life, dying on the 13th of August 1842. Michael Banim had acquired a considerable fortune which he lost in 1840 through the bankruptcy of a firm with which he had business relations. After this disaster he wrote *Father Connell* (1842), *Clough Finn* (1852), *The Town of the Cascades* (1865). Michael Banim died at Booterstown on the 30th of August 1874.

The true place of the Banims in literature is to be estimated from the merits of the *O'Hara Tales*; their later works, though of considerable ability, are sometimes prolix and are marked by too evident an imitation of the Waverley Novels. The *Tales*, however, are masterpieces of faithful delineation. The strong passions, the lights and shadows of Irish peasant character, have rarely been so ably and truly depicted. The incidents are striking, sometimes even horrible, and the authors have been accused of straining after melodramatic effect. The lighter, more joyous side of Irish character, which appears so strongly in *Samuel Lover*, receives little attention from the Banims. See P. J. Murray, *Life of John Banim* (1857).

**BANJALUKA** (sometimes written *BANJALUKA*, or *BAINALUKA*), the capital of a district bearing the same name, in Bosnia. Pop. (1895) 13,666, of whom about 7000 were Moslems. Banjaluka lies on the river Vrbas, and at the terminus of a military railway which meets the Hungarian state line at Jasenovac, 30 m. N.N.W. Banjaluka is the seat of Roman Catholic and Orthodox bishops, a district court, and an Austrian garrison. It is at the head of a narrow defile, shut in by steep hills on the east and west but expanding on the north to meet the valley of the Save. A small stream, called the Crkva, which enters the Vrbas from the north-east, flows in the angle thus formed, and the citadel and barracks, with the 16th-century Ferhadija Jamia, largest and most beautiful of more than 40 mosques in the city. The celebrated Roman baths are all in ruins, except one massive, domed building, dating from the 6th century and still in use, although modern baths are also open, for the development of the hot springs. Other noteworthy buildings are the Franciscan and Trappist monasteries, a girls' school, belonging to the Sisterhood of the Sacred Blood of Nazareth, a real-school and a Turkish bazaar. Coal, iron, silver and other minerals are found in the adjoining hills; and the city possesses a government tobacco factory, a brewery, cloth-mills, gunpowder-mills, a model farm and many corn-mills, worked by the two rapid rivers.

Banjaluka is probably the Roman fort, marked, in the *Tabula Peutingeriana*, as *Castra*, on the river Urbansus and the road from Salona on the Adriatic to Servitium in Pannonia. The origin of its later name, meaning the "Baths of St Luke," is uncertain. In the 12th century, the *Bosanski*, a rival stronghold 22 m. S., led to the renaming of Banjaluka. Banjaluka looks thenceforward the scene of many encounters between Austrians and Turks; notably in 1527, 1688 and 1777. No Bosnian city had greater prosperity or importance in the last half of the 18th century. In 1831, Hussein Aga Borberli, called the "Dragon of Bosnia," or *Zmaji Bosanski*, set forth from Banjaluka on his holy war against the sultan Mahmoud II. (See Bosnia.)

**BANJERMASIN** (Dutch *Bandjermasien*), the chief town in the Dutch portion of the island of Borneo, East Indies, on the river Martapura, near its junction with the Barito, 24 m. from the mouth of the Barito in a bay on the south coast. The town is the seat of the Dutch resident of South and East Borneo. Its buildings stand on either bank of the river, but many of the inhabitants (who number nearly 30,000) occupy houses either floating on, or built on piles in the river. As large vessels can sail up to the town, it is a trade centre for the products of the districts along the banks of the Barito and Martapura, such as benzoin, rattans, wax, gold, diamonds, iron and weapons. In 1700 the East Indian Company established a factory here; but the place was found to be unhealthy, and the Company's servants were finally attacked by the natives, whom they repulsed with great difficulty. The settlement was abandoned. The English again seized Banjermas in 1811, but restored it in 1817. Of the commercial community the Chinese are a very important portion, and there is also a considerable number of Arabs. The district of Banjermas was incorporated by the Dutch in consequence of the war of 1860, in regard to the succession in the sultanate, which had been under their protection since 1787. The town of Martapura was the seat of the sultan from 1771. The inland portion of the district is covered with forest, while the flat and swampy seaboard is largely occupied by rice-fields. The inhabitants are mostly Dyaks.

**BANJO**, a musical instrument with strings plucked by fingers or plectrum, popular among the American negroes and introduced into Europe by the negroes. The word is either a corruption of "bandor" or "pandura" (q.v.), an instrument of the guitar type, or is derived from "bania," the name of a similar primitive Senegambian instrument.

The banjo consists of a body composed of a single piece of vellum stretched like a drum-head over a wooden or metal hoop to ensure the requisite degree of resonance; the parchment may be tightened or slackened by means of a series of screws disposed round the circumference of the hoop. Attached to the body, which has no back, is a long neck, terminating in a flat head acting as a peg-box and bent back slightly at an obtuse angle from the neck. There are five, six or nine strings to the banjo; they are fastened to a tail-piece as in the violin, pass over a low bridge, on the body, and are strained over the nut or ridge at the end of the neck, where they are threaded through holes and wound round the tuning-peg fixed in the back of the head in Oriental fashion, as in the lute (q.v.). The strings are stopped.
by the pressure of the fingers against the finger-board which lies over the front of the neck; the correct positions for the formation of the intervals of the scale are indicated in some banjos by frets consisting of metal or wooden bands inlaid in the finger-board. The vibrating length of the strings from bridge to nut is 24 in. for all except the highest in pitch, known as the "chanterelle," "melody" or "thumb string," which is only 16 in. long; its tuning peg is inserted half-way up the neck. The chanterelle is not, as in other stringed instruments, in its position as the highest in pitch, but is placed next the lowest string for convenience in playing it with the thumb. In the tables of accordance here given, the chanterelle is indicated by a X. The five-stringed banjo is tuned either

The six-stringed is tuned

The nine-stringed banjo has three thumb strings thus

The G clef is used in notation, but the notes sound an octave lower than they are written. The banjo is usually a transposing instrument in the sense that, when playing with other instruments, the A corresponds to the C of the piano or violin; the key of A major is therefore the first to be mastered. The chanterelle does not lie over the finger-board and is always played open by the thumb.

The banjo is held so that the neck is even with the left shoulder and the body rests on the right thigh; the front of the instrument is held inclined at an angle, allowing the performer to see all the strings. When played as a solo instrument, a fret may be used with good effect to produce rapid scale and arpeggio passages, and to produce the tremolo or sustained notes as on the mandoline (q.v.). The best results are obtained by means of a tortoise-shell fretboard about the size of a shilling, having the contact-edges highly polished, bevelled and terminating in a point. The tone of the banjo is louder and harder than that of the guitar.

Chords of two, three and four notes can be played on it.

The banjo or bania of the African negro having grass strings is still in use on the coast of Guinea. The banjo was made known in England through companies of coloured ministers from the United States, one of which came over to London as early as 1866.

(K S)

**BANK,** known also as "Polish Bank" and "Russian Bank" a card-game. An ordinary pack is used. Five or six players is a convenient number. Each contributes an arranged stake to the pool. The dealer gives three cards to each player and turns up another; if this is not lower than an eight (ace is lowest) he goes on till such a card is exposed. The player on the dealer's left, without touching or looking at his cards, can bet the amount of the pool, or any part of it, that among his cards is one that is higher (of the same suit) than the turn-up. If he wins, he takes the amount from the pool; if he loses, he pays it to the pool. Each player does the same in turn, the dealer last. Whenever the pool is exhausted, a fresh stake is put into the pool. After a round is over, the deal passes.

**BANKA** (Banka, Banoka), an island of the Dutch East Indies, off the east coast of Sumatra, from which it is separated by Banka Strait, which is about 9 m. wide at its narrowest point. On the east, the broader, island-studded Gaspar Strait separates Banka from Billiton. Banka is 138 m. in length; its extreme breadth is 62 m., and its area, including a few small adjacent islands, 44,60 sq. m. The soil is generally dry and stony, and the greater part of the surface is covered with forests, in which the logwood tree especially abounds. The hills, of which Maras in the north is the highest (2760 ft.), are covered with vegetation to their summits. Geologically, Banka resembles the Malay Peninsula, its formations being mainly granite, Silurian and Devonian slate, frequently covered with sandstone, laterite (red ironstone clay) of small fertility, and alluvium. The granite extends from W.N.W. to S.S.E., forming the short, irregular hill-chains. As these lie generally near the east coast, it follows that the rivers of the west coast are the longer. There are no volcanoes. The chief rivers (Jering, Kotta and Waringin) are navigable for some 10 m. from their mouths and are used for the transport of tin. Banka is principally noted for the production of this mineral, which was discovered here in 1710 and is a government monopoly. It occurs in lodes and as stream-tin, and is worked by Chinese in large numbers who inhabit villages of their own. The island is divided into nine mining districts, including about 120 mines, under government control, with 12,000 workmen, which have produced as much as 12,000 tons of tin in a year. From May to August, the period of the south-east monsoon, the climate of Banka is dry and hot; but the mean annual rainfall reaches 120 inches of rain occurring only in the very early morning and evening. The wet, cool season proper is from November to February, accompanying the north-west monsoon. The heavy rainfall is of great importance to the tin-streaming industry. The total population of the island (1905) is 15,180, including 40,000 Chinese and 70,000 natives. These last are mainly composed of immigrant Malayan peoples. The aborigines are represented by a few rude hill-tribes, who resemble in physique the Battas of Sumatra. Rice, pepper, gambier, coffee and palm are cultivated, and fishing and the collection of forest produce are further industries, but none of these is of importance. The chief town is Muntok at the north end of Banka Strait.

See H. Zondervan, Banka en Zijne bewoners (Amsterdam, 1893), with bibliography; T. Posewitz, Die Zinn-inself in Indischen Ocean. For geology and the tin-mines, Jaarbar van het Mijnwezen in Ned. Ind. (Amsterdam, 1877-84).

**BANKER-MARKS, or Masons' Marks.** The "banker" is the stone bed or bench upon which a mason works, hence the term (so well known to the trade) of banker-marks, which, as Mr Whitby has pointed out, is more appropriate than that of masons' marks. Since the setters, who are usually selected from among the best workmen, make no marks upon the stone (Leamington Spa Courier, 17th of August 1888). These must not be confused with other marks sometimes cut on stones as directions to the setters, and so used and employed to the present time. Banker-marks are met with throughout the civilized world, and in fact are to be found on all old buildings of consequence, ecclesiastical or otherwise. Professor T. Hayter Lewis well observed, "Go where you will, in England, France, Sicily, Palestine, you will find all through the buildings of the 12th century the same carefully worked masonry, the same masons' tool-marks, the same way of making them." Such masons' marks are to be traced gravur on all the chief stones of what is known as Norman work. Norman tooling, so far as Hayter Lewis could discover, came from the north and west of Europe. Since then we get marks made with a "toothed chisel," but however or wherever chiselled the intention was the same. The system followed provided an infallible means of connecting the individual craftsman with his work, an evidence of identity that could not be gainsaid.

Naturally, because of their simplicity, certain designs were followed much more frequently than others, while occasionally some of a very elaborate character are to be detected. Undoubtedly not a few were suggestive of the initials of the names of the masons, and others were reminiscent of certain animals, objects, &c., but no proof has yet been offered of their being alphabetical in design, or arranged so as to distinguish the members of different lodges or companies; the journeymen selected any design they cared to adopt.

Singular to state, marks were chosen by gentlemen and others

2 For the commercial "bank" see Banks and Banking.
who joined the operative masonic lodges of the 16th and later centuries, and they were as carefully registered in the mark-
books as those selected by lottery for trade purposes. The
same marks are to be seen in the registers used by founders
and sons, and not always with a slight difference, as some have stated,
to secure identification. What should be noted also is that other
trades used precisely similar marks and for a like object, so that
the idea of their having a mystical meaning, or being utilized
for any other object but the one named, seems groundless.

The late George Godwin, F.R.S., F.S.A., &c., drew attention to
the subject of "masons' marks in various countries" in a
communication to the Society of Antiquaries in 1841, and also
at a little later period (vide Archaeologia, vol. xxx. p. 113). To
him is the credit due of first drawing attention to "these signs"
in England. It is noteworthy how little such marks are noticed,
even in buildings which are visited by archaeologists quite
frequently, until a few are pointed out, and then they meet the
eye to an astonishing number. In the Sessionsal Papers, 1868-
1869, of the Royal Institute of British Architects, No. 9, may
be found numerous samples of the marks from various parts
of Europe in illustration of the paper by Godwin.

No better plan has been followed in modern times to connect
the work done with the worker in stone, and it is probable that a
second mark, observable on some blocks, may serve to indicate
the sort of stone used. There are even three or more sometimes.

The same system was adopted at the building of Truro cath-
dral, only the marks were inserted on the bed of each stone
instead of at the side as usual, the result being that they ceased
to be seen after being placed in situ. Mr Hughan obtained
copies of these marks from Mr James Bubb, the first clerk of the
works, and from his successor, Mr Robert Swain, and had them
published in the Freemason, 13th of November 1886. He
remarked at the same time that "many of these designs will be
familiar to students of ancient ecclesiastical and other buildings
at home and abroad." Some are interesting specimens.

A Historical Treatise on Early Builders' Marks (Philadelphia,
U.S.A., 1885) by Mr G. F. Fort, and Masons' Marks from Buildings
in the Vicinity of London and Bristol, History and Meaning of
Masons' Marks (Historic Society of Lancashire and Cheshire,
with advantage. The latter declares that "the Runic theory is as
unlikely and as unattainable as that which places the origin of
these marks on the stonecarvers of the African tribes, such as
the Agbala, who died early in the 16th century." Victor Didron copied some 4000
during a tour in France in 1836 and pointed out their value
(Ann. Arch., Ad.).

BANKET, a South African mining term, applied to the beds of
auriferous conglomerate, chiefly occurring in the Witwatersrand
gold-fields (see Gold). The name is given to these beds from their
resemblance to a sweetmeat, known in Dutch as "banket," or
"banquet," resembling almond hard-bake. The word is the same as "ban-
quett," and is derived ultimately from "banker" or "banque,
meaning table-feast, hence applied to any delicacy or to various
kinds of confectionery, a use now obsolete in English.

BANK-HOLIDS, in the United Kingdom, those days which by
the Bank Holidays Act 1871 are kept as close holidays in all
banks in England and Ireland and Scotland respectively.
Before the year 1834, the Bank of England was closed on certain sain-
t's days and anniversaries, about thirty-three days in all. In 1834
these were reduced to four—Good Friday, 1st of May, 1st of
November and Christmas Day. By the act of 1871, carried
through the House of Commons by Sir J. Lubbock (afterwards
Lord Avebury), the following were constituted bank holidays in
England and Ireland—Easter Monday, the Monday in Whitsun
week, the first Monday of August, the 26th of December if a
week-day; and by the Bank Holiday (Ireland) Act 1903, March
17th as a special bank holiday for Ireland (see FEASTS AND
FESTIVALS). In Scotland—New Year's Day, Christmas Day,
Good Friday, the 1st Monday of May, the 1st Monday of
August. If Christmas Day and New Year's Day fall on a
Sunday, the next Monday following is the bank holiday.
No person is compelled to make any payment or to do any act upon
a bank holiday which he would not be compelled to do or make
on Christmas Day or Good Friday, and the making of a payment
or the doing of an act on the following day is equivalent to
doing it on the holiday. By the same act it was made lawful for
the sovereign from time to time, as it should seem fit, to
appoint for proclamation in the same manner public holi-
days of public thanksgiving, any day to be observed as a
bank holiday throughout the United Kingdom or any part of it,
or to substitute another day when in any special case it appears
inevitable to the sovereign in council to keep the usual bank
holiday. (See further HOLIDAY.)

BANKIPUR, an ancient village on the Hugli river in the
Bengal Presidency, near the modern Patla above Barrackpore.
It has disappeared from the map, but is famous as the principal
settlement of the ill-fated Ostend Company, the one great effort
made by Germany to secure a foothold in India. The Ostend
Company was formed in 1722-1723, and with a capital of less
than a million sterling founded two settlements, one at Cobhlon
(Covelong) on the Madras coast between the English Madras
and the Dutch Sadras, and the other on the Hugli between the
English Calcutta and the Dutch Chinsura. Both English and
Dutch were offended in 1727, in order to obtain the European
guarantee for the Pragmatic Sanction, the court of Vienna resolved
to sacrifice the Company and suspended its charter. It became
bankrupt in 1784 and ceased to exist in 1793. But in the mean-
time in 1733 the English and Dutch stirred up the Mahomedan
generaHugli to pick a quarrel. He attacked Bankipur and the
building on the spot was destroyed for all Europe. Thus
German interests disappeared from India.

BANK-NOTES. For our present purpose we include in this
description all paper substitutes for metallic currency whether
issued by banks, governments or other financial institutes.

Early bank-notes were simply printed forms in which the
amounts were written by hand. They were usually for large
amounts (£50 and upwards) and were printed upon water-marked
paper; and, although no precautions were taken in the engraving
to prevent fraudulent imitation, forgeries were comparatively
rare. But, when at the end of the 18th century small notes for
£1 and £2 were put in circulation, forgery became rife, as many as
352 persons being convicted of this crime in England in a single
year; and from that time to the present a constant trial of skill
has been going on between the makers of bank-notes and the
counterfeiters. Engine-turned ornaments and emblematical
figures or views introduced in the engraving, in conjunction with
special water-marks in the paper, held the forgers somewhat in
check until the discovery of photography put into the hands of
the counterfeiter a most dangerous weapon, by the aid of which
complicated patterns and vignettes could be perfectly reproduced.

To prevent such reproduction Henry Bradbury in 1856 intro-
duced anti-photographic bank-note printing, in which the
essential portions of the note were printed in one colour and over
this another protective colour was placed. A photograph of
a note printed in this way presented a confused mingling of the
two colours; but with the advance of photographic knowledge
means were found of obtaining a photograph of either colour
separate from the other, and it consequently became necessary
to introduce a third colour and to secure a special photographic
relation between the three colours to prevent their separation.

Photography, however, although the most dangerous weapon
of the counterfeiter, is not the only means of imitation available,
a fact which is sometimes overlooked. A note may be perfectly
secure against photographic reproduction, but from the absence
of other necessary features may be easily copied by an engraver
of ordinary skill. There are two systems of engraving employed
in bank-notes:—(1) line-engraving in which the lines are cut
into the steel or copper plates; and (2) relief-engraving in which
the lines stand up above the plate as in wood-engraving. In
the former, adapted to the process called plate-printing, the ink is
delivered from the lines in the plate to the paper pressed upon it;
in the latter, adapted to surface-printing, the ink is spread upon
the face of the lines and printed as in typography. Plate-printing
gives by far the finer and sharper impression, but as there is a
perceptible body of ink transferred to the paper from the cut
lines, it has been supposed that an impression from plate would
be more easily photographed than one from surface where only a film of ink is spread upon the top of the raised lines. But surface-printing being much less sharp and distinct than plate-printing, imperfect copies of notes for which that process is used are the more likely to escape detection. The plates upon which the early notes were engraved being of copper quickly wore out and had to be constantly replaced. The result was great difference in the appearance of the notes, those printed from new plates being sharp and clear, while others, printed from old plates, were pale and blurred. These differences were a great assistance to the forger, as the public, being accustomed to variations of appearance between different genuine notes, were less apt to remark the difference between these and counterfeits.

In the early part of the 19th century, Jacob Perkins (1766-1849) introduced into England from America what is known as the transfer-process, in which the original engraving on steel is hardened and an impression taken from it on a soft steel cylinder, which in its turn is hardened and pressed into a soft printing-plate. By this means as many absolutely identical plates can be produced as may be required, and being hardened they will yield a very large number of prints without any appreciable deterioration. Another method of securing uniformity is the multiplication of plates by electro-deposition, the surface of the copper-electrotype plates being protected by the deposit of a film of steel which effectually prevents the wearing of the copper and can be renewed at will.

The water-mark of the paper, on which formerly reliance was placed almost exclusively, puts a difficulty in the way of the counterfeiter, but experience has shown that in ordinary circumstances it does not in itself afford adequate protection. The means by which it can be imitated are well known, and, since a distinct water-mark is incompatible with strong paper, the life of a water-marked note is much shorter than that of one printed upon plain paper. The best bank-note paper is made from pure linen rags and was formerly made by hand. Machine-made paper is however now largely used, as it possesses all the strength of hand-made and is much more uniform in thickness and texture.

In documents which pass current as money it is obviously the duty of the bank or government issuing them to take all reasonable means to prevent the public from being defrauded by the substitution of counterfeits; and a bank which circulation depends upon the confidence of the public must do, so in its own interests to insure the acceptance of its notes. This principle is now recognized by all issuing institutions, and in practice there is room for improvement in the issues of many important establishments, partly because of the disinclination of the directors of a bank to change the form of an issue to which the public is accustomed, partly because of the difficulty of deciding what is really a secure note, and in certain cases because, owing to exceptional circumstances, an issue may be practically immune from forgery although the notes themselves present little or no difficulty in imitation. The features essential to the security of an issue are (1) absolute identity in appearance of all notes of the issue; (2) adequate protection by properly-selected colours against photographic reproduction; and (3) high-class engraving comprising geometrical lathe work and well-executed vignettes. In addition it is important that the design of the note should be striking and pleasing to the eye, and the inscription legible. The notes of the Bank of England are printed in the bank from surface-plates in black without colour or special protection except the water-mark in the paper. They are never reissued after being once returned to the bank, and their average life is very short, about six weeks, so that a dirty or worn Bank of England note is practically never seen. This arrangement, coupled with the difficulty of negotiating forged notes in England, the lowest denomination being £5, accounts for the comparative immunity from forgery of the bank's issues.

**BANK RATE**

A term used in financial circles to designate the rate of discount charged in the chief monetary centres by the state or leading bank, as opposed to the open-market rate. (See **Market:** Money market.)

**BANKRUPTCY** (from Lat. bancus or Fr. bancque, table or counter, and Lat. ruplus, broken), the status of a debtor who has been declared by judicial process to be unable to pay his debts. Although the terms "bankruptcy", "definition", and "insolvency" are sometimes used indiscriminately, they have in legal and commercial usage distinct significations. When a person's financial liabilities are greater than his means of meeting them, he is said to be "insolvent"; but he may nevertheless be able to carry on his business affairs by means of credit, paying old debts by incurring new ones, and he may, if fortunate, regain a position of solvency without his creditors ever being aware of his true condition. And even when his insolvency becomes public and default occurs, a debtor may still avert bankruptcy if he is able to effect a voluntary arrangement with his creditors. A debtor may thus be insolvent without becoming bankrupt, but he cannot be a bankrupt without being insolvent, for bankruptcy is a legal declaration of his insolvency and operates as a statutory system for the administration of his property, which is thereby taken out of his personal control.

In primitive communities bankruptcy systems were unknown. Individual creditors were left to pursue their remedies by such means as the law or practice of the community might sanction, and these were generally of a very drastic character. Under the Roman law of the Twelve Tables, the creditors might, as a last resort, cut the debtor's body into pieces, each of them taking his proportionate share; and although Blackstone in quoting this law appears to cast some doubt upon its too literal interpretation, there can be no doubt that the power of selling the debtor and his family into slavery, which his family and debtors could not therefore be enforced against the person of the debtor; but as trade began to develop it was found necessary to provide some means of bringing personal pressure to bear upon debtors for the purpose of compelling them to meet their obligations, and under the practice of the English courts of law the right of a creditor to enforce his claims by the imprisonment of his debtor was gradually evolved (although no express legal enactment to that effect appears at any time to have existed), and this practice continued until comparatively recent times.

Without some system of enforcing payment of debts it would have been impossible for the commerce of the world to have attained its present proportions; for modern commerce is necessarily founded largely on credit, and credit could not have existed without the power of enforcing the fulfilment of financial contracts. On the other hand remedies against a debtor's person, and still more against the persons of his family, are not only inconsistent with the growth of opinion among civilized communities, but are in themselves worse than futile, inasmuch as they strike at the root of all personal effort on the part of a debtor to retrieve his position and render a return to solvency impossible. Hence the necessity of devising some system which is just to creditors while not unduly harsh upon debtors, which discriminates between involuntary inability to meet obligations and wilful
recovery or neglect, and which accrues to creditors as between themselves an equitable share of such of the debtor's assets as may be available for the payment of his liabilities. These are the objects which the bankruptcy law has primarily in view. Another object, which has not always been so fully recognized as it might appear to deserve, has marked the most recent legislation, namely, the fostering of a higher tone of commercial morality and the protection of the trading community at large from the evils arising through the reckless abuse of credit and the unnatural trade competition thereby engendered. It must be admitted that these objects are of a somewhat conflicting character, and wherever the state has interfered with the view of securing an efficient system of bankruptcy legislation the task has been found to be extremely difficult. Not only have the conflicting interests of the debtor and his creditors to be taken into account, but the method to be adopted in dealing with his property has also given rise to much conflict of opinion, and to a lack of uniformity and consistency in the legislation which dealt with it. The debtor's property was naturally regarded as belonging to the creditors, but it could not be distributed among them until it was realized, and until their respective right and interests were determined by competent authority. In some cases claims to rank as creditors are of doubtful validity. In others the creditor holds securities, the value of which requires investigation, or he claims a preference to which he may or may not be legally entitled. Creditors have thus conflicting interests as between themselves, and are therefore incapable of acting together as a homogeneous body. Hence the necessity for calling in the aid of professional assignees or trustees, solicitors and other agents, who made it their special business to deal with such matters, exercising both administrative and quasi-judicial functions, in return for the remuneration which they receive out of the property for their services. Professional interests, which are not always identical with the interests of the debtor or the creditors, are thus called into existence, and these interests have from time to time exercised a powerful influence in shaping the course of legislation.

While the law of bankruptcy has therefore been largely the product of commercial development, it has necessarily been of slow and gradual growth, tentative in its character, and subject to oscillation between the extremes of conflicting interests according to the temporary and varying predominance of each of these interests from time to time. No intelligible grasp of the principles which underlie the history of bankruptcy legislation in England, and no satisfactory explanation of the fluctuating tendencies which have marked its progress, are possible without bearing these considerations in view.

Bankruptcy in England.

The subject was originally dealt with in the sole interest of creditors; it was considered fraudulent for a debtor to procure his own bankruptcy. Thus the earliest English statute on the subject, 34 & 35 Henry VIII. c. 4 (A.D. 1542), was directed against fraudulent debtors, and gave power to the lord chancellor and other high officers to seize their estates and divide them among the creditors, but afforded no relief to the debtor from his liabilities. Subsequent legislation modified this attitude and introduced the principle of granting relief to the bankrupt with or without the consent of the creditors, where he conformed to the provisions of the bankruptcy law, and under the act of 1825 the debtor was allowed himself to initiate proceedings. Since 1542 about forty acts of parliament have been passed, dealing with the many aspects of the subject, and slowly expanding, modifying and building up the highly complex system of administration which now exists.

The courts exercising jurisdiction originally consisted of commissioners appointed by the lord chancellor. But in 1821 a special court of bankruptcy was established, consisting of six commissioners with four judges as a court of review, and official assignees attached to the court for the purpose of getting in the distributing the bankrupt's assets. Non-traders were originally excluded from the bankruptcy court, and a special court called the "court for relief of insolvent debtors" was instituted for their benefit, in which relief from the liability to imprisonment could be obtained on surrender of their property, but they were not discharged from their debts, subsequently-acquired property remaining liable. Both of these courts were subsequently abolished, non-traders were permitted to obtain the benefit of the bankruptcy laws, including a discharge, and in 1868 the system of official assignees was swept away, and a new court of bankruptcy created with one of the vice-chancellors at its head as chief judge, and a number of subordinate registrars or inferior judges under him. This court has also now been abolished, and the business is administered by a judge of the high court specially appointed for the purpose by the lord chancellor, with registrars of the high court, who deal with the ordinary judicial routine of bankruptcy procedure in the London district, while similar duties are performed by the county-court judges throughout the country.

But the questions which have proved the most difficult to deal with, and which more than any others have been the cause of fluctuating and inconsistent legislation, have undoubtedly been those relating to the share which the creditors ought to have in the administration of the proceedings, and to special arrangements effected between a debtor and his creditors under conditions more or less beyond the control of the court. These two questions are largely intermixed, and the history of English legislation on these points and its results throw much light on the causes of the failure of the many attempts which have been made by the most eminent legal authorities to bring the law into a satisfactory condition. The right of creditors to exercise some control in bankruptcy over the realization of the debtor's property through an assignee chosen by themselves was recognized at an early date, but this right was exercised subject to the supervision of the court which investigated the claims of creditors and determined who were entitled to take part in the proceedings. Provision was also made for the interim protection of the debtor's property by official assignees attached to the court, who took possession until the creditors could be consulted, and under the supervision of the court audited the accounts of the creditor's assignee. So long as this system continued substantial justice was generally secured; the claims of creditors were strictly investigated and only those who clearly proved their right before a competent court were entitled to take part in the proceedings. The bankrupt was released from his obligations, but only after strict inquiries into his conduct and under the exercise of judicial discretion. The accounts of assignees were also strictly investigated, and the costs of solicitors, agents and other persons were taxed by officers of the court. But the system was found to be cumbersome, to lead to delay and too often to the absorption of a large part of the estate in costs, over the incurring of which there was a very ineffective control. Hence arose a demand for larger powers on the part of creditors, and the introduction into the bankruptcy procedure of the system of "arrangements" between the debtor and his creditors, either for the payment of a composition, or for the liquidation of the estate free from the control of the court. At first these arrangements were carefully guarded. Under the act of 1825 a proposal for payment of a composition might be adopted only after the debtor had passed his examination in court, and with the consent of nine-tenths in number and value of his creditors assembled at the court. Since 1827 about forty acts of parliament have been passed, dealing with the many aspects of the subject, and slowly expanding, modifying and building up the highly complex system of administration which now exists.

Court of 1831.

A special court of bankruptcy was established, consisting of six commissioners with four judges as a court of review, and official assignees attached to the court for the purpose of getting in the distributing the bankrupt's assets. Non-traders were originally excluded from the
BANKRUPTCY

323

action, a control for which they are naturally unsuited, and which they could only carry out by cumbersome and expensive methods of procedure. Under the act of 1849 a totally new principle was introduced by the provision that a deed of arrangement executed by six-sevenths in number and value of the creditors for £10 and upwards should be binding upon all the creditors without any proceedings in or supervision by the court. But the determination of the question who were or were not creditors was practically left to the debtor himself, without any opportunity for testing by independent investigation the claims of those who signed the deed to control the administration of the estate. It is not difficult to see, in the light of subsequent experience, how likely this provision was to encourage fraudulent arrangements, and to introduce laxity in the administration of debtors' estates. A modification of the too stringent conditions of the act of 1829, which would have enabled a bankrupt to pay a composition on his debts, with the consent of a large proportion of his bona-fide creditors, and subject to the approval of the court, after hearing the objections of dissenting creditors, would doubtless have proved a beneficial reform, but the act of 1849 proceeded on a very different principle. Instead of reforming, it practically abolished judicial control. By avoiding Scylla it fell into Charybdis. To give any majority of creditors the power to release a debtor from his debts, without full and final settlement of his affairs, and without any exercise of judicial discretion or any investigation into the causes of the failure, or the conduct of the debtor, would in any circumstances have been to introduce a new and mischievous principle into legislation, for it would necessarily destroy the essential feature of such arrangements, that they are voluntary contracts, the responsibility for which lies solely with the parties entering into them. But to give such a power to creditors whose claims were subject to no independent investigation was to invite inevitable confusion and failure.

Yet this was the dominating principle of English bankruptcy legislation for nearly thirty-five years. Its effect under the act of 1849 was, however, to some extent modified by subsequent decisions of the courts that to make a composition arrangement binding it must be accompanied by a complete cessio bonorum; but this qualification was removed by the act of 1861 which made such arrangements binding without a cessio and reduced the majority required to make a deed of arrangement binding of all the creditors without full and final settlement of the affairs in value of those whose claims amounted to £10 and upwards. The result was an enormous increase in fraudulent arrangements. The then attorney-general, Sir Robert Collier, in introducing an amending act in 1860, described the abuses which had grown up under the 1849 and 1861 acts, as having the effect of enabling a bankrupt to "defraud those to whom he was indebted and to set them at defiance"; while Lord Cairns, the lord chancellor, in the House of Lords expressed the opinion that the large increase which had taken place in the annual insolvent of the country during the preceding years could not be attributed to depression of trade but must be traced to the enormous facilities which are given to debtors who wish to be released from their debts on easy terms. And yet in the legislation which ensued these facts were entirely ignored or lost sight of.

It is indeed a curious illustration of the difficulties which have attended bankruptcy legislation in England that the very measure (the act of 1860) which was introduced to remedy this deplorable condition of affairs, was twelve years afterwards denounced in parliament by the president of the Board of Trade (Mr Joseph Chamberlain) as "the most unsatisfactory and most unfortunate of the many attempts which had been made to deal with the subject" and as "the object of the almost unanimous condemnation of all classes." How was this? Under the act of 1860, the procedure under a bankruptcy petition was certainly rendered effective. Meetings of creditors were presided over and creditors' claims were, for voting purposes, adjudicated upon by the registrar of the court; the bankrupt had to pass a public examination in court, which although chiefly left to the trustee appointed by the creditors, afforded some opportunity for investigation; and the bankrupt could not obtain his discharge without the approval of the court and in certain circumstances the consent of the court. An independent official, the comptroller in bankruptcy, was appointed, whose duty it was to examine the accounts of trustees, call them to account for any misfeasance, neglect or omission, and refer the matter to the court for the exercise of disciplinary powers where necessary. These provisions were well calculated to promote sound administration, but they were, unfortunately, rendered nugatory by provisions relating to what were practically private arrangements on similar lines to those which had rendered previous legislation ineffective. In some respects the evil was aggravated. Deeds of arrangements were nominally abolished, but under sections 125 and 126 of the act a debtor was empowered to present a petition to the court for liquidation of his affairs by "arrangement," or for payment of a composition, whereupon a meeting of creditors was summoned from a list furnished by the debtor, and without any judicial investigation of claims, a majority in number and three-fourths in value of those who lodged proofs of debt, and who were present in person or by proxy at the meeting, might by resolution agree to liquidation by arrangement or to the acceptance of the composition. Such resolution thereupon became binding upon all the creditors. In the case of the composition, the court, any judicial examination of the debtor, or any official supervision over the trustee's accounts. The debtor was not permitted to present a bankruptcy petition against himself, and consequently his only method of procedure was that which thus removed the matter from the supervision and control of the court, and as about nine-tenths of all the proceedings under the act of 1869 were initiated by debtors, it followed that only about one-tenth was submitted to proper investigation. It is true that the creditors might refuse to assent to the debtor's proposal, and that any creditor for £50 or upwards could present a petition in bankruptcy, but even where this course was adopted, the proceedings under the petition were, as a rule, stayed by the court if the debtor subsequently presented a proposal for liquidation or composition, and the creditor was left to pay the expenses of his petition if the requisite majority voted for the debtor's proposal. So far, therefore, as the act was concerned, every inducement was held out to the adoption of a course which took the examination of the debtor, the conditions of his discharge and the audit of the trustee's accounts out of the control of the court.

The establishment of a bankruptcy court, with its searching powers of investigation and its power of enforcing penalties on misconduct, can only be defended on the ground that the administration of justice is a matter affecting the interests of the community at large. But apart from the injury done to these interests by reducing the administration of justice to a question of barter and arrangement between the individuals immediately concerned, one of the chief reasons why the acts of 1849, 1861 and 1869 proved failures, lies in the obvious fact that the creditors of a particular estate are not, as appears to have been assumed, a homogeneous or organized body capable of acting together in the administration of a bankrupt estate. In the case of a few special and highly organized trades it may be otherwise, but in the great majority of cases the creditors have but little knowledge of each other or means of organized action, while they have neither the time nor the inclination to investigate the complicated questions which frequently arise, and which are therefore left in the hands of professional trustees or legal agents. But the appointment of trustees under these acts, instead of being the spontaneous act of the creditors, was frequently due to touting on the part of such agents themselves, or to individual creditors whose interests were not always identical with those of the general body. According to G. Y. Robson, the author of a standard work on the subject, the arbitrary powers conferred by the act of 1861 "led to great abuses, and in many cases creditors were forced to accept a composition, the approval of which had been obtained by a secret understanding between the debtor and favoured creditors, and not unfrequently by the creation of fictitious debts." These evils
were greatly aggravated by the decisions of the court relating to proofs on bills of exchange, under which it was held that the holder of a current bill could prove on the bankrupt estate of an insolvent, although the bill was not yet due, and the acceptor was perfectly solvent and able to meet it at maturity. Thus in large mercantile failures, bankers and other holders of first-class bills could prove and vote on the estates of their customers, for whom the bills had been discounted, and thus control the entire proceedings, although they had no ultimate interest in the estate.

But probably the greatest source of the abuses which arose under the act of 1869 was the proxy system established by the act and by the rules which were subsequently made to carry it out. The introduction of proxies was no doubt intended to give absent creditors an opportunity of expressing their opinions upon any question which might arise. But the system was too often used for the purpose of stifling the views of those who took an independent part in the proceedings. The form of proxy prescribed by the rules contained no limitation of the powers of the proxy-holder and no impression of the opinion of the creditor. It simply appointed the person named in it as "my proxy," and these magic words gave the holder power to act in the creditor's name on any questions that might arise at any time during the bankruptcy. Hence to obtain the practice of canvassing for proxies, which were readily given under the influence of plausible representations, such as the holding out of the prospect of a large composition, but which, when once obtained, could be used for any purpose whatsoever except the receipt of a dividend. Thus it frequently happened that the entire proceedings were controlled by professional proxy-holders, in whose hands these documents acquired a marketable value. They were not only used to vote for liquidation by arrangement instead of bankruptcy proceedings, but not infrequently the matter took the form of a bargain between an accountant and a solicitor, under which the former became trustee and the latter the solicitor in the liquidation, without any provision for control over expenditure or for any audit of the accounts.

Even where a committee of inspection was appointed to examine functions of control and audit, they too were often appointed by the proxy-holders, and not infrequently shared in the benefits. On the other hand, where the amount of debts represented by the proxy-holder was insufficient to carry the appointment of a trustee and committee, the votes could be sold to swell the chances of some other candidate. Hence ensued a system of trafficking in these instruments, the cost of which had in the long run come out of the estate. The result was that undesirable persons were too frequently appointed, whose main object was to extract from the estate as much as possible in the shape of costs of administration. The debtor was practically powerless to prevent this result. If he attempted to do so, he sometimes became a target for the exercise of revenge. His discharge, which under liquidation by arrangement was entirely a matter for the creditors, might be refused indefinitely; and so largely and harshly was this power exercised under the proxy system, especially where it was supposed that the debtor had friends who could be induced to come to his aid, that a special act of parliament was passed in 1887, authorizing the court to deal with cases where, under the act of 1869, a debtor had not been able to obtain discharge from his creditors. On the other hand, the compliant debtor, although he had incurred large obligations in the most reckless manner, often succeeded in stigmatizing and obtaining his release without difficulty as a return for his aid in carrying out the arrangement.

The result of such a system could not be other than a failure. After the act of 1869 had been in operation for ten years, the comptroller in bankruptcy reported that out of 13,000 annual failures in England and Wales, there were only 1,000 cases (or about 8%) "to which the more important provisions of the act for preventing abuses by insolvent debtors and professional agents applied; the other 12,000 cases (or 92%) escaping the provisions which refer to the examination and discharge of bankrupts, and to the accounts, charges and conduct of the agents employed." It is not to be supposed that all the cases in the latter class were marked by the abuses which have been here described.

In a large number the proceedings were conducted by agents of high character and standing, and with a due regard to the interests of the creditors. But the facilities for fraudulent and collusive arrangements afforded by the act, and the want of effective control over administration, inevitably tended to lower the morale of the latter, and to throw into the hands of the less scrupulous members of the profession. The demand for reform, therefore, came from all classes of the business community. No fewer than thirteen bills dealing with the subject were introduced into the House of Commons during the ten years succeeding 1869. At length in 1879 a memorial, which was authoritatively described as "one of the most influential memorials ever presented to any government," was forwarded to the prime minister by a large body of bankers and merchants in the city of London. The matter was then referred to the president of the Board of Trade (Mr Chamberlain), who made exhaustive inquiries, and in 1881 introduced a measure which, with some amendments, finally became law under the title of the Bankruptcy Act 1883.

Hitherto the question had been dealt with as one of legal procedure; it was now treated as an act of commercial legislation, the main object of which, while providing with carefully framed regulations, was to prevent the further use of the liquidation process in the transfer of the debtor's assets, to promote and enforce the principles of commercial morality in the general interests of the trading community. One of the chief features of the act of 1883 is the separation which it has effected between the judicial and the administrative functions which had previously been exercised by the court, and the transfer of the latter to the Board of Trade as a public department of the state directly responsible to parliament. Under the powers conferred by the act a new department was subsequently created under the title of the bankruptcy department of the Board of Trade, with an officer at its head called the inspector-general in bankruptcy. This department exercises, under the direction of the Board of Trade, a general supervision over all the administrative work arising under the act. It has extensive powers of control over the appointment of trustees, and conducts an audit of their accounts; and it may, subject to appeal to the court, remove them from office for misconduct, neglect or unfairness. A report upon the proceedings under the act is annually presented to parliament by the Board of Trade, and although the department is practically self-supporting, a nominal vote is each year placed upon the public estimates, thus bringing the administration under direct parliamentary criticism and control. The act also provides for the appointment and removal by the Board of Trade of a body of officers entitled official receivers, with certain prescribed duties having relation both to the conduct of bankrupts and to administration of their estates, including the interim management of the latter until the creditors can be consulted. These officers act in their respective districts under the general authority and directions of the Board of Trade, being also clothed with the status of officers of the courts to which they are attached. While effecting this supervision and control by a public department directly responsible to parliament, the main objects of the measure were to secure—(1) An independent and public investigation of the debtor's conduct; (2) The punishment of commercial misconduct and fraud in cases of public morality; (3) The summary and inexpensive administration of small estates where the assets do not exceed £500 by the official receiver, unless a majority in number and three-fourths in value of the creditors voting resolve to appoint a trustee; (4) Full control in other cases by a majority in value, over the appointment of a trustee and a committee of inspection; (5) Strict investigation of proofs of debt, with regulations as to proxies and votes of creditors; (6) An independent audit and general supervision of the proceedings and control of the funds in all cases. Besides amending and consolidating previous bankruptcy legislation, the measure also contains special provisions for the administration under bankruptcy law of the estates of persons dying insolvent (£125); and for enabling county courts to make administration orders for payment by instalments in lieu of immediate committal to prison, in the case of judgment debtors whose total indebtedness does
not exceed £50 (§ 122). It also provides for the getting in and administration by the Board of Trade of unclaimed dividends and undistributed balances on estates wound up under previous bankruptcy acts (§ 162). Lastly, it amends the procedure under the Debtors Act of 1869, dealing with criminal offences committed by bankrupts (which, prior to 1869, had been treated as part of the bankruptcy law), by enacting that when the court orders a prosecution of any person for an offence under that act, it shall be the duty of the director of public prosecutions to institute and carry on the prosecution.

An amending act, under the title of the Bankruptcy Act 1890 was passed in that year, mainly with the view of supplementing and strengthening some of the provisions of the act of 1883, more particularly with regard to the conditions under which a bankrupt should be discharged or schemes of arrangement or composition be approved by the court. It also dealt with a variety of matters of detail which experience had shown to require amendment, with the view of more fully carrying out the intentions of the legislature as embodied in the principal act. These two acts are to be construed as one and may be cited collectively as the Bankruptcy Acts 1883 and 1890. They are further supplemented by a large body of general rules made by the Lord Chancellor with the concurrence of the Lord President of the Board of Trade, which may be added to, revoked or altered from time to time by the same authority. These rules are laid before parliament and have the force of law.

Besides these general acts, various measures dealing with special interests connected with bankruptcy procedure have from time to time been passed since 1883, the chief of which are as follows, viz., the Bankruptcy Appeals (County Courts) Act 1884; the Preferential Payments in Bankruptcy Act 1888, regulating the priority of the claims of workmen and clerks, &c., for wages and salaries; and the Bankruptcy (Discharge and Closure) Act 1887, dealing with unclosed bankruptcies under previous acts.

It would be out of place in this article to attempt to answer the question how far later legislation has solved the difficult problems which prior to 1883 were found so intractable, but it may be mentioned that in 1906 the Board of Trade appointed a committee to inquire into and report upon the effect of the provisions of the laws in force at the time in the United Kingdom in relation to bankruptcy, deeds of arrangement and composition made by bankrupts with their creditors, the prevention and punishment of frauds by debtors on their creditors, and any points and matters upon which the existing laws seemed to require amendment. The committee received a vast amount of evidence as well as documents and memoranda from chambers of commerce, trade protection societies and influential public bodies. The scope of the inquiry was not limited to English law and procedure, but also embraced that of Germany, France, Australia, Scotland and Ireland. The report of the committee was issued in 1908 (Cd. 4068), and reference may be made to it for much valuable information. The committee reported that the result of their inquiry did not disclose any dissatisfaction on the part of the commercial community with the main features of the existing law and procedure. But there were certain special incidents of the law and branches of its administration upon which the committee made recommendations. One was the prosecution and punishment of debtors who had committed fraud on their creditors or caused loss to them by improper and reckless trading. The existing procedure was complained of as being dilatory, cumbersome and expensive, and the committee were of an opinion that where a debtor had committed an offence for which he could and ought to be prosecuted, prosecution and conviction, with adequate punishment, ought to follow speedily and decisively, and the chief recommendation of the committee was that, while the existing procedure should be left untouched, offences ought also to be punishable on summary conviction before magistrates and justices, and the provisions of the Summary Jurisdiction Acts applied to them, and that where an order for a prosecution is made on an application by the official receiver of a bankruptcy court and based on his report, that court should have power to order the official receiver to conduct the prosecution before the court of summary jurisdiction. The committee also reported that numerous delinquencies by insolvent debtors in the conduct of their affairs, or which had contributed to the losses sustained by their creditors, were not punishable or even cognizable by courts having bankruptcy jurisdiction unless or until a debtor who had a receiving order against him, or became a bankrupt, applied for an order sanctioning a composition or scheme of arrangement with his creditors, or for an order discharging him from his debts. The most prominent of these delinquencies which were brought to the notice of the committee were—failure by a debtor to keep any books or any proper or adequate books of account in his business; trading with knowledge of insolvent; gambling and speculation leading to, or contributing to, the debtor's insolvency or bankruptcy; failure properly to account for any substantial deficiency of assets. The committee received a large body of evidence in favour of making delinquencies such as have been described punishable by imprisonment. Evidence was also given as to the laws in force in Germany, France and Scotland, from which it appeared that such delinquencies, especially that of keeping no books of account, can be severely dealt with as criminal offences.

The inquiry on both sides of the committee recommended that the failure or omission by a debtor who becomes bankrupt to keep any books of account, or proper books of account, within two years next preceding his bankruptcy, in a trade or business carried on by him, if without excuse, should be made by law an offence punishable on summary conviction by imprisonment, subject to four important limitations, namely, that the law should define what books of account a person carrying on a trade or business must keep, following in this respect the law in force in France and Germany; that failure or omission by a debtor to have kept the required books should only be punishable in the event of a debtor becoming bankrupt and of the liquidated debts proved in the bankruptcy exceeding £200 in amount; that no prosecution of a debtor for failure or omission to keep books of account should take place before the lapse of two years from the passing of the law; that a debtor should not be punished if he could show that his failure or omission to keep proper books was honest and excusable and did not contribute to his insolvency, and that no prosecution should be instituted for the offence except by order of the bankruptcy court. The committee in recommending legislation of the same character with regard to punishable some of the other delinquencies mentioned above. There were also recommendations by the committee as to trading by undischarged bankrupts, as to the realization of estate on bankruptcy, as to the operation of the law of relation back of a bankruptcy trustee's title, as to the law relating to the after-acquired property of an undischarged bankrupt, and dealings with such property, and with respect to married women and their liabilities under bankruptcy law. The committee also reported on the law and practice relating to voluntary deeds of arrangement between a debtor and his creditors and on the compulsory regulation of assignments of book debts, and of agreements for the hire and purchase of chattels.

In addition to this report the annual reports of the Board of Trade, which are accompanied by elaborate tables of statistics, and by copious illustrations both of the working of the system and of the characteristic features and causes of current insolvency, are published as parliamentary papers, and may be usefully consulted by those interested in the subject. It appears from these reports that the total number of insolvencies dealt with under the bankruptcy acts during the ten years ending 31st December 1896 was 243,141, involving estimated liabilities amounting to £61,655,678, and estimated assets amounting to £56,001,417. It may also be pointed out that according to the official figures, the cost of bankruptcy administration under the present system has very considerably decreased as compared with that under the act of 1869. Estates are also closed at much shorter intervals, and, what is more important from a public point of view, it appears
that while the estimated liabilities of bankrupt estates during the
ten years ending 1883 amounted on an average to £23,380,000
per annum, the estimated liabilities during the ten years ending
1905 only averaged £6,168,597 per annum. But during the latter
period there was an annual average of 3426 private arrangements
involving a further estimated annual liability of £4,166,354
entered into outside of the Bankruptcy Acts by insolvent
debtors. There are no means of ascertaining the corresponding
amount of liabilities on private arrangements outside of the
Bankruptcy Acts prior to 1883, and therefore a complete com-
parison is impossible; but it is evident that on any method of
computation there has been a very great diminution in the
trading insolvency of England and Wales, while it is also clear
as a matter of general knowledge in commercial circles, that a
great decrease in the proportion of fraudulent trade and reckless
speculation has been a marked feature of private trading during
the period in question.

The cost of bankruptcy administration is provided for: (1) by
fees charged to bankrupt estates, (2) by interest on balances at
the credit of such estates with the bankruptcy estates account,
and (3) by interest on unclaimed funds at the credit of estates
under former Bankruptcy Acts.

Out of this are paid the salaries of all the officers of the depart-
ment, including the official receivers; the remuneration due in
respect of bankruptcy services to the county court registrars;
pensions, &c., payable to retired officers under the present and
previous Bankruptcy Acts; cost of bankruptcy prosecutions;
and rents, stationery, travelling and other incidental expenses.
The system is self-supporting and involves no charge upon the
tax-payers of the country. It has been objected that inasmuch
as the act professes to be based on the principle of enforcing
commercial morality in the interests of the general community,
the cost of administering it should not be charged entirely to the
bankruptcy estates concerned. But when it is considered that a
large part of the revenue of the department is derived from funds
to which estates administered under the present act have con-
tributed nothing, this objection does not appear to be well founded.

For the convenience of readers who may require more detailed
information, the accompanying summary of some of the more
important provisions of the law relating to bankruptcy
procedure is submitted. It must be borne in mind, however, that the subject is in some of its branches extremely intricate, and that both the law and the
procedure are being constantly affected by a considerable body
of judicial interpretation, while the acts also contain detailed
provisions with regard to many questions incident to the ad-
mnistration of bankruptcy. A reference to the latest text-
books or competent professional advice will always be advisable
for those who have the misfortune to be practically interested
either as debtors or as creditors in bankruptcy proceedings.

The Deeds of Arrangement Act 1887, although not falling
strictly within the scope of the bankruptcy law, may also, in
consequence of its important bearing upon the question of
insolvency in England and Wales, be here noticed.

It has been pointed out that, under the Bankruptcy
Acts of 1849 and 1861, non-official arrangements by
deed between a debtor and the general body of his creditors were
not only officially recognized, but were in certain circumstances
made binding on all the creditors, including those who refused
to assent to them. Under the act of 1860, although such deeds
were no longer recognized or made binding on non-assenting
creditors, the proceedings under the "liquidation by arrange-
ment" and "composition" clauses were practically private
arrangements by resolution instead of deed, and were proved by
experience to be open to the same abuses. It has also been
shown that under the act of 1883 no arrangements either by
deed or by resolution have any force against dissenting creditors,
unless confirmed after full investigation and approval of the
bankruptcy courts. Private arrangements, therefore, cease to
form any part of the bankruptcy system. But they are, never-
theless, binding as voluntary contracts between the debtor and
such creditors as assent to them. Being, however, in the nature

of assignments of the debtor's property, they are either deemed
fraudulent if the benefit of the assignment is limited to a portion
of the creditor or, if it is extended to all they become acts of
bankruptcy, and, like any other voluntary assignment, are
liable to be invalidated if made within three months prior to the
petition on which a receiving order is made against the debtor.
Treated as voluntary assignments, which are not binding on
those who do not assent to them, such arrangements, where
honestly entered into and carried out by capable administration,
in many cases form a useful and expeditious method of liquidating
a debtor's affairs, and where the debtor's insolvency has been
brought about without any gross misconduct they will probably
always be largely resorted to. The danger attending them is
that even in cases where the debtor has been guilty of mis-
conduct, a private arrangement may be used to screen his
conduct from investigation, while in many cases it may be made
the medium for the concealment of fraudulent preferences.

The absence of any independent audit of the trustees' accounts
may also encourage or conceal irregularities in administration.
Previous to 1887, however, much inconvenience arose from the
fact that the execution of these private arrangements was
frequently kept secret, and fresh creditors obtained by the
debtor without any opportunity being afforded for the new
creditors becoming acquainted with the fact that they were
dealing with an insolvent person, and that in many cases they
were simply supplying the means for meeting past obligations
in respect of which the debtor had already committed default.
The Deeds of Arrangement Act 1887 was therefore passed to
compel the disclosure of such arrangements, by declaring them
void unless registered within seven days after the first
execution by the debtor or by any creditor. Registration is
effected by lodging with the registrar of bills of sale at the central
office of the Supreme Court a true copy of the deed and of every
inventory and schedule attached thereto, together with an
affidavit by the debtor, stating the total estimated amount
of property and liabilities, the total amount of composition, if any,
and the names and addresses of the creditors. Where the
debtors' residence or place of business is outside the London
bankruptcy district, the registrar is required to forward a copy
of the deed to the registrar of the county court of the district
where the debtor's residence or place of business is situated.
Both the central and the local registers are open to public
inspection on payment of a small fee and general publicity is
secured by the action of various trade agencies, which make a
practice of extracting and publishing the information for the
benefit of those interested. By section 25 of the Bankruptcy
Act 1890, every trustee under a deed of arrangement is required
to transmit to the Board of Trade within thirty days of the 1st of January in each year an account of his receipts and pay-
ments and such accounts are open to the inspection of any
creditor on payment of a small fee. They are not, however,
subject to any kind of audit or control by the department.
The registrar is also required to make periodical returns of the
deeds thus registered to the Board of Trade, in order that a
report of proceedings under the Deeds of Arrangement Act
may be included in those which the department is
required to make on proceedings under the Bankruptcy Acts.
Full statistics of such proceedings are accordingly included
in these reports, from which it appears that during the ten years
ended 31st December 1905 the total number of registered deeds
of arrangement was 34,273, with estimated liabilities amounting
to £41,663,541, and estimated assets to £23,029,483.

Summary of Bankruptcy Procedure.—Subject to certain special
provisions in the case of what are termed "small bankruptcies"
(see below), the following summary sets forth some of the more
important provisions of the various acts and rules relating to
bankruptcy administration grouped under convenient heads to
facilitate reference. In some cases the effect of legal decisions
has been embodied in the summary.

Preliminary Proceedings.

Petition and Receiving Order.—Any court exercising bankruptcy
jurisdiction in the district in which he resides or carries on business
in England or Wales may make a receiving order against a debtor, whether a trader or not, either on his own petition or on that of a creditor or creditors whose claims aggregate not less than £50. In the case of a creditor's petition, the proof must be given of the debt, and on a creditor's petition the fact of the debt, and the proof of the date of the petition. An act of bankruptcy is committed if the debtor fails to satisfy the creditor's claim on a bankruptcy notice; if he makes an assignment for the benefit of his creditors; or if he absconds without providing for the payment of his debts; or if the bankruptcy trustee, after a period of 12 months, finds that the debtor has committed an act of bankruptcy. If an act of bankruptcy is committed, the claimant must serve upon the debtor a bankruptcy petition, and the bankruptcy trustee must apply to the court for an order of bankruptcy. An order of bankruptcy is issued if the court finds that the debtor has committed an act of bankruptcy. The court must issue an order of bankruptcy if the debtor has committed an act of bankruptcy.

Object and Effect of Receiving Order.—The object of the order is to prevent the debtor from committing any further acts of bankruptcy, and to constitute the official receiver attached to the court receiver of the debtor's property, although the legal title still remains in the debtor. Where there is an estate or business to be managed or sold, the court may appoint a receiver or manager, to receive and sell the estate or business, and to distribute the proceeds to the creditors in proportion to their claims.

Effect on Bankrupt.—The bankruptcy is binding on the trustee in bankruptcy, and the court, and if the bankrupt fails to deliver up any part of the estate or property of the bankrupt, or if he fails to pay any money to the official receiver, or if he fails to give any security for the payment of his debts, the court may make a further order of bankruptcy. The bankruptcy is binding on the creditor, and if the creditor fails to receive any part of the estate or property of the bankrupt, or if he fails to pay any money to the official receiver, or if he fails to give any security for the payment of his debts, the court may make a further order of bankruptcy.

Bankruptcy 327

First Meeting of Creditors.

This meeting is summoned by the official receiver, notice being given in the London Gazette and in a local paper, and sent by post to each creditor. A summary of the statement of affairs should accompany the notice, with any observations by the official receiver which he may think fit to make. The object of the meeting is to determine the details of the insolvent estate, and to settle a scheme of arrangement submitted by the debtor or manager of the estate. The meeting is summoned by the official receiver, and the creditors or managers of the estate are entitled to attend. At the meeting, the official receiver must give a statement of the estate, and a vote must be taken by creditors on the adoption of the scheme of arrangement. The scheme of arrangement must be approved by a majority of creditors representing not less than three-quarters in value of all the creditors. The scheme of arrangement must provide for the payment of all debts in full or in a composition scheme that requires a majority in number and three-quarters in value of all the creditors who have agreed to it. The majority of questions arising at a meeting are decided by an ordinary resolution.

Adjournment.—If the creditors so resolve, or if a composition or scheme of arrangement is not proposed by the debtor or entertained by the court, or if, without reason, the official receiver does not propose a composition or scheme of arrangement that is acceptable to the creditors, or if his public examination is adjourned sine die, the court adjudicates the bankrupt bankrupt and thereupon his property vests in a trustee, and, subject to the payment of the costs and fees of proceedings in the court, and the costs of and expenses occasioned by the examination, the bankrupt and all his property, except his personal effects, is sold in full and in interest at the rate of 4% per annum. No creditor of the bankrupt has any right to any share of the proceeds of the sale.
of any partner or co-obligant with him. Neither does it release the bankrupt from liability to criminal prosecution.

**Composition or Scheme of Arrangement.**

After a receiving order has been made the debtor may submit a proposal for the payment of a composition, or for the liquidation of his affairs, by a trustee or otherwise, without adjudication. The proposal must be lodged with the official receiver in sufficient time to allow of a meeting of all the creditors before the meeting is held at which it is to be considered. If the proposal is entertained at the meeting by a majority in number and three-fourths in value of all the creditors who have proved their debts and have voted in the meeting, the court may accept the proposal. If the court accepts the proposal, the debentures binding upon all creditors who would be bound by an order of discharge had the debtor been adjudicated bankrupt. A similar proposal may be made after adjudication, and if entertained by the creditors and approved by the court, the adjudication may be annulled. Where the proposal is accepted for a composition or scheme, but his future acquired property will not pass to the creditors unless there is an express stipulation to that effect. If default is made in carrying out the scheme, or if it is found that it cannot be carried out without injustice or undue delay, the court may at any time adjudicate the debtor bankrupt, in which case the scheme will fall to the ground, except in respect of past transactions under it. The approval of a composition or scheme does not release the debtor from any criminal or civil liability, and, if he is adjudicated bankrupt after having been a director or an officer of the company whose claim is sold or transferred under the scheme, he may be committed for a breach of the bankruptcy act. 

**Claims of Creditors and Dividends.**

In the distribution of the debtor's property certain claims are entitled to priority over others. Thus the landlord, although not entitled to a preference out of the funds in the hands of the trustee, can claim for unpaid rent on the goods and effects of the debtor remaining on the landlord's premises, but where the claim is either levied after the commencement of the bankruptcy this right is limited by the act of 1890 to six months' rent due before adjudication. The remaining claims are divided among the creditors, and this may be for the bankrupt's benefit, and not for the benefit of the creditors. 

**Property divisible among the Creditors.**

No part of the law of bankruptcy is more intricate, or has been the subject of more discussion, than this. Any decision on the effect of legal decisions can only be gathered by a perusal of the cases; but the following general principles may be stated:—The term "property" includes not only property of which the bankrupt is the true owner, but property in his possession, order or disposition in which he is possessed, order or disposition, and in which he has power to dispose of, as well as property in which he is entitled to participate, or on which he has an equitable interest. The application of the doctrine of real property is limited to cases in which the property is not expressly made a subject of a contract of purchase of a mortgage. In such cases the trustee may, therefore, require the money or property to be restored to the estate. And even where no prior act of bankruptcy is proved, any payment made to a creditor with the view of giving such creditor power to sell or transfer the property within three months preceding the presentation of the petition on which the property is made bankrupt, is rendered void as against his trustee. 

**Settlements of Property within the Two Years Preceding the Bankruptcy.**

Settlements of property within the two years preceding the bankruptcy, and made in good faith for valuable consideration, are also void, as are similar settlements within ten years, unless it is proved that the settlor was (independently of the settled property) solvent at the date of the settlement, and that the interest in the property passed to the settlor before the bankruptcy. If after the first meeting of creditors, and subsequent dividends at intervals of not more than six months, but the declaration may be postponed for sufficient reason by the committee of inspection. Notice of the intention to declare a dividend is gazetted and sent out to the creditors, and is an advertisement to all who has not proved. The notice should state the last day for proving in order to participate in the distribution, and should be given not more than two months before the declaration. When the dividend is declared, notice of the amount due, and the place where the same is payable, is sent to each creditor who has proved, with a statement showing particulars of the estate. And provision must be made for creditors at a distance, who have not had time to prove, for disputed claims, and for debts the subject of claims not
yet determined. Creditors who fail to prove before the declaration of a dividend are entitled to receive their dividends on proving before any subsequent dividend is declared, but cannot disturb the distribution of any dividend already declared. Before distress can be levied, notice must be served, and a claim has been notified to the trustee, but not finally established, with an intimation that unless so established within a specified period he will be excluded from participation in the estate. In the case of a joint holders, a claim is not entitled to receive a dividend out of the separate property of the bankrupts until all the separate creditors are paid in full.

Trustee's Administration.

While the interim preservation and management of the estate is conducted by or under the direct supervision of officers appointed by and responsible to the Board of Trade, the ultimate realization and distribution of the estate is essentially in the hands of the creditors, either through a receiver appointed by the creditors. But besides acting as receiver prior to the first meeting of creditors, the official receiver also becomes trustee by operation of law on the making of an order of adjudication. He vacates the office when a trustee is appointed by the creditors and certified by the Board of Trade, but again becomes trustee on the creditors' trustee being released, dying, resigning or being removed from office. As the bankrupt's property vests in the trustee for the time being summoned for the purpose to try and operate and dispose of the property, and without any formal act of conveyance, the continuity of the office is thus secured.

Appointment of Trustee.—A trustee may be appointed by a majority of the creditors present at the first meeting of creditors, or by the Board of Trade for misconduct or incapacity, and in such case the appointment may be left to the committee of inspection. In either case the appointment is subject to confirmation by the Board of Trade, who may object on the ground that the creditors have not acted in good faith in the interests of the general body, or that the proposed act, order, or position is inconsistent with the interests of the creditors. An appeal from such objection to the High Court lies at the instance of a creditor in value of the creditors, but in the absence of an appeal it is fatal to the appointment. Before being confirmed, the trustee-elect must also attend the Board of Trade, and such security must be kept up to the amount originally fixed, or to such lesser amount as that department may require throughout the tenure of the trusteeship, failing which the trustee is liable to be removed. If any duly appointed trustee fails to act, the Board of Trade may do so, but such appointment may at any time be superseded by the creditors.

Removal.—The trustee may be removed by the creditors at a meeting summoned for the purpose without reason assigned, or by the Board of Trade for misconduct, or for incapacity or failure to perform his duties, or on either of the other personal grounds of objection to which the appointment is open. But the removal is in no case to be without the order of the Board of Trade, and such order is to be made against a trustee he thereby vacates office. He may also, with the consent of a general meeting of creditors, resign, but his resignation does not operate as a release from the liabilities of the interim administration.

Powers and Duties.—The trustee is required to take immediate possession of the bankrupt's property, including deeds, books and accounts, and has the power of a receiver in the High Court for the purpose of enforcing delivery. After payment of the costs of administration it is his duty to distribute the estate, preferably as speedily as possible. He may also, and with the sanction of the committee, or, where there is none, with that of the Board of Trade, carry on the business so far as is necessary to a beneficial winding-up. The general legal provisions enabling the receiver to divest himself of any business previously sanctioned by the same authority, compromise debts and claims, raise money on mortgage, sell property, divide the estate where practicable among the creditors in the order of their priority, and with the sanction of the court to directions which may be given by the creditors in general meeting, or failing them by the committee, sell the property or part of it for cash, including business goodwill and book debts, and either sell real property or give such powers of sale of general property as may be requisite to carry out the wishes of the creditors. He must keep a record book (which is commenced by the official receiver) containing minutes of the proceedings in the bankruptcy, and a cash book in the prescribed form, in which all receipts and payments by him are to be entered, and a book which must be paid into an account at the Bank of England, entitled the "Bankruptcy Estates Account," which is under the control of the Board of Trade, unless where in certain circumstances the sanction of that depart- ment is obtained to the opening of a local banking account, but in no circumstances must estate monies be paid to the trustee's private account. When monies are required for the purpose of the estate, special cheques or money orders are issued by the Board of Trade on the order of the trustee.

Control over Trustee.—In his administration the trustee is subject to control by the committee of inspection, the creditors, the court and the Board of Trade. The committee is appointed by the creditors, and must consist of not more than five persons, or, if necessary, of six persons, including the receiver and a majority of creditors. It acts by a majority present at a meeting, and should be convened once a month unless it otherwise directs. If no committee is appointed, the Board of Trade may give any direction or order which it considers expedient for the purpose of enabling the committee to ascertain their wishes, and must do so when so required by one-sixth in value of the creditors or when directed by the court. The Board of Trade may also direct the official receiver to summon a meeting of the creditors, and to perform such other office as may be given by the committee, if not inconsistent with the provisions of the act, are binding on the trustee, unless contrary to or overruled by those of the creditors or of the court. The official receiver or trustee is entitled to the protection of the court in the discharge of such duties, and the court may require him to make good any loss that may arise to the estate from any act done by him in the discharge of his duties, and may require him to make it good. The orders of the Board of Trade under the powers conferred by the act may be enforced by the court under certain circumstances, or by the committee of the trustee or otherwise.

Accounts and reports must be audited by the committee of inspection not less than once in every three months, and once in every six months, as well as at the close of the administration, and the record and cash books must also be submitted to the committee of the trusteeship, the Board of Trade, and the court for final audit. If it appears that the trustee has retained more than $500 in hand for more than ten days without a satisfactory explanation, he may be removed from office, suceeded with interest at the rate of 2 per cent, and interest on $250 for any default in removal. Remuneration.—The trustee's remuneration is fixed by the creditors or by the committee if so authorized by them. It must be in the nature of a percentage on the amount of the realization and not by fixed amounts. It may be increased or decreased at any time, or withdrawn altogether. The court may review the same and fix the remuneration. A trustee may not receive any remuneration for the purposes of the act and the court may order the receiver to pay, or upon conviction to the court the solicitor, auctioneer, &c., beyond that voted to him as trustee; nor may he share his remuneration with the bankrupt, the solicitor or other person employed upon the bankruptcy; or receive from any person any gifts whatever pecuniary or other benefit in connexion therewith.

Costs.—A trustee receiving remuneration is not allowed the costs of any other person in respect of duties which ought to be performed by himself. All bills of solicitors and other agents employed must be paid before payment, as being in accordance with the prescribed scales of costs; and the taxing master must satisfy himself that the employment has been properly authorized before the work was done. All bills of costs must be delivered to the trustee within seven days of the request for the same, otherwise the estate may be distributed without regard to the same.

Release.—When the property, so far as it is capable of realization, has been realized and distributed, the trustee must apply to the Board of Trade for his release, forwarding to each creditor a notice of the decree and an intimation that he is about to be discharged from the estate. The Board of Trade, after preparing and considering a report on the same, and the objections of any person interested, may, subject to appeal to the High Court, grant or withhold the release. If a receiver is appointed in the event of a winding-up or final close of the bankruptcy, to deal with any circumstances which may arise, or which have not been foreseen and provided for.

Small Bankruptcies.

When the official receiver reports, or the court is otherwise satisfied that the debtor's property is not likely to realize more than $1,000, the court may make an order for the summary administration of the estate, in which case, if the debtor is adjudged bankrupt, the official receiver in the ordinary course becomes and remains trustee, and certain other modifications are effected with the view of simplifying
and accelerating the procedure. The chief of these modifications are as follows, viz. the Board of Trade acts as committee of inspection; there is no advertisement of the proceedings in a local paper; in legal proceedings all questions of law and fact are determined by the court without jury, adjuration may be made on a report by the official receiver before the first meeting of creditors where no composition or scheme is proposed; meetings of creditors may be held in the town where the court sits or the official receiver's office is situated; in Scotland, the creditors may at any time by a resolution passed by a majority in number and three-fourths in value of those voting at the meeting, appoint a trustee in place of the official receiver, in which case the summary order ceases to be operative.

Scottish Bankruptcy Legislation.

In Scotland, as in England, the law of bankruptcy arose as a remedy against the frauds of insolvent debtors. It was deduced by an act of the Scottish parliament (1621, c. 18) that no debtor after insolvency should fraudulently diminish the fund belonging to his creditors, and if a deed of assignment was gratuitously executed after the contracting of debt in favour of a near relation or a confidential friend, fraudulent dealing was to be presumed. The act 1666, c. 5, settled the definition of a notour or notorious bankrupt, a question which had previously engaged the attention of the judges of the court of session. The statute defines a "notour bankrupt" to be any debtor who, being under diligence by horning or caption, at the instance of his creditors, shall be either imprisoned, or retire to the abbey or any other privileged place, or flee or abscond for his personal security, or defend his person by force, and who shall afterwards be found, by sentence of the lords of session, to be insolvent. Bankruptcy as thus defined was, it is said, intended to afford a remedy against fraudulent preference by debtors, and not as the ground-work of a general process of distribution, although by later statutes it became a necessary requisite of every such process.

The exceptions recognized in the act of 1666, of persons absent from Scotland and therefore not liable to imprisonment, or of persons exempted therefrom by special privileges, were removed by later legislation. The old English distinction between traders and non-traders, it will be observed, is not recognized in Scottish law. The statute made null and void all voluntary dispositions, assignations and other deeds made after or within sixty days before bankruptcy.

In 1856 was passed the Bankruptcy (Scotland) Act, by which the law of bankruptcy in Scotland is mainly regulated. By this act, notour (i.e. legally declared) bankruptcy was constituted:

1. By sequestration (or adjudication in England and Ireland); and
2. By insolvency concurring either—(a) with a duly executed charge for payment or (b) with sale of effects belonging to the debtor under a poinding or under a sequestration for rent, or making application for the benefit of insolvent debtors.

Sequestration may be had in cases of sequestration, until the debtor has obtained his discharge and in other cases until insolvency ceases. Sequestration may be awarded of the estate of any person in the following cases:

1. Living debtor subject to jurisdiction of Scottish courts—(a) on his own petition with concurrence of qualified creditors, or (b) on petition of qualified creditors, provided he be a notour bankrupt, and have had a dwelling-house or place of business in Scotland within the previous year.
2. In the case of a deceased debtor, subject at his death to the jurisdiction of the court—(a) on the petition of his mandatory; or (b) on the petition of qualified creditors ($ 13).

Sequestration may be awarded either by the court of session or by the sheriff. A sequestration may be recalled by a majority in number and four-fifths in value of the creditors, who may prefer to wind up the estate by private arrangement. If the sequestration proceeds, the creditors hold a meeting, and by a majority in value elect a trustee to administer the estate, and three commissioners (being creditors or their mandatories) to assist and control the administration and declare the dividends.

The bankrupt (under pain of imprisonment) must give all the information in his power regarding his estate and he must be publicly examined on oath before the sheriff; and "conject and confident persons" may likewise be examined. The bankrupt may be discharged either by composition or without position. In the latter case (1) by petition with concurrence of all the creditors, or (2) after six months with concurrence of a majority and four-fifths in value of the creditors, or (3) after eighteen months with concurrence of a bare majority in number and value, or (4) after two years without concurrence. In the last case the judge may refuse the application if he thinks the bankrupt has fraudulently concealed his effects or willfully failed to comply with the law. This act was amended by the Bankruptcy and Real Securities Act 1857, which deals with the cost of competition for trusteeships; the Bankruptcy Amendment (Scotland) Act 1860, which enables the court to recall a sequestration where it becomes inconvenient that the estate should be wound up in England or Ireland; and the Bankruptcy Amendment Act (Scotland) 1875, which makes the wages of clerks, shopmen and servants preferential claims for a period not exceeding four months and an amount not exceeding £50, while the claims of workmen are placed on a similar footing for a period not exceeding two months. Some important changes were subsequently introduced, one of the principal being that effectuated by the Debtors (Scotland) Act 1880, which abolished imprisonment for debt, but which, like its English prototype (the Debtors Act 1869), contains a series of important provisions for the punishment of fraudulent bankrupts. Under these provisions the laws of the two countries on that subject are practically assimilated, although some minor differences still survive.

One of the most important of these differences is, that while the Scottish act makes the failure, within the three years prior to the sequestration, to keep "such books and accounts as, according to the usual course of any trade or business in which he is engaged, was necessary to exhibit or explain his transactions" a criminal offence, the English act contains no provision of an analogous character; the non-keeping of such books being treated as a fact to be taken into account in dealing with the debtor's application for his discharge but not coming within the scope of the criminal law. On the other hand, there are a few minor trading irregularities dealt with in the English act which are not specifically included in that of Scotland. Another important distinction is that under the Scottish act the same offences may be treated differently, according as they are brought for trial before the court of justiciary or a sheriff and jury, in which case the maximum penalty is two years' imprisonment; or before a sheriff without a jury, in which case the penalty is limited to imprisonment for a period not exceeding sixty days. This distinction admits of a useful elasticity in the administration of the law, having regard to the comparative importance of the case, which is hardly possible under the English law.

Another most important modification of the law is effected by the Debtor's Act 1880, combined with the Bankruptcy and Cessio Act 1881, and the Act of Sedentury anent Cessio of the 22nd of December 1882. Under the law existing prior to these enactments, the process of cessio bonorum operated chiefly as a means for obtaining release from imprisonment for debt on a formal surrender by a debtor of all his goods and estate. But under this process the debtor was not entitled to a discharge, and his future-acquired property was still subject to diligence at the instance of unsatisfied creditors. By abolishing imprisonment for debt (except in regard to crown debts and public rates and assessments), the legislature also practically abolished this use of the process of cessio, and the process itself would probably have become obsolete, but for certain changes effected by the act of 1881, which have given it a different and more extended scope. Among these changes may be noted (i)
the extension to “any creditor of a debtor who is notour bank-
rupt,” without reference to the amount of his debt, of the right
hitherto limited to the debtor himself, to petition the court for a
decree of cessio, the prayer of the petition, whether presented by
the debtor or by a creditor, being “to appoint a trustee to take the
management and disposal of the debtor’s estate for behalf of
his creditors”; (2) the discretionary power given to the court
upon such petition to award sequestration under the bankruptcy
act, in any case where the liabilities of the debtor exceed £200;
and (3) the right of the debtor to apply for his discharge under
similar conditions to those obtaining in the case of sequestration.
An important modification of the law relating to discharge which
equally affects a debtor under the Bankruptcy and Cessio Acts,
is also effected by the provision of the act of 1881, which requires,
in addition to the concurrence of creditors, the fulfilment of one
of the following conditions, viz., (a) That a dividend of five
shillings in the pound has been paid out of the estate of the
debtor, or that security for payment thereof has been found to
the satisfaction of the creditors; or (b) That the failure to pay
five shillings in the pound has, in the opinion of the sheriff,
 arisen from circumstances for which the debtor cannot justly
be held responsible.” Orders of cessio are only made in the
sheriff courts, and when made, the court also appoints a
trustee, who conducts the proceedings without the control
exercised by the creditors in a sequestration. Under these
conditions it will be seen that the original purpose and con-
stitution of the process of cessio has entirely disappeared,
and it has now become a modified form of official bankruptcy
procedure, with a less elaborate routine than in the case of
sequestration, and one perhaps more suitable to the smaller
class of cases, to which in practice it is limited.

The Bankruptcy Frauds and Disabilities (Scotland) Act 1884
applies to sequestrations and decrees of cessio the criminal
provisions of § 31 of the English Bankruptcy Act 1883, relating
to the obtaining of credit for £20 and upwards by an undischarged
bankrupt, without disclosure of his position. It also places the
law relating to the dispossession attaching to such bankrupts
on a similar footing to that of the English act.

The Judicial Factors Act of 1880 contains a provision calculated
to check excessive costs of administration, by requiring that
where the remuneration of a trustee under a sequestration is to
be fixed by the commissioners, intimation of the rate of re-
numeration is to be given to the creditors and to the account-
ent of court before being acted on, and the latter officer is empowered,
subject to appeal, to modify the same if he deems it expedient.

It may be pointed out that the Deeds of Arrangement Act
1887, which applies to England and Ireland, does not apply to
Scotland, and there is no analogous provision requiring registra-
tion of private deeds of assignment for the benefit of creditors
as a condition of their validity in that country.

Finally, it is to be noted that the office of accountant in bank-
ruptcy, which was established by the Bankruptcy Act of 1856,
has under the Judicial Factors Act 1880 been abolished, the
duties being merged in those of the office of accountant of the
court of session.

Irish Bankruptcy Legislation.
The Irish law of bankruptcy is regulated by the two leading
Irish statutes of 1857 and 1872, together with the Irish Debtors
Act 1872, and corresponds in its main features to some of the
older English enactments, with modifications adopted from the
English act of 1869. It may be pointed out, however, that the
system of liquidation by arrangement and composition without
the approval or control of the court, which proved fatal to the
success of the latter, has not at any time been imported into the
Irish law. A special act was passed in 1888 for establishing
local bankruptcy courts in certain districts in Ireland, and an
act was also passed in 1889, applying the main provisions of
the English Act of 1888, relating to preferential payments in bank-
ruptcies in Ireland.

The Deeds of Arrangement Act 1887, which has been already
discussed above under the head of English bankruptcy legislation,
also applies in its main provisions to Ireland, and as supplemented
by the Irish Deeds of Arrangement Amendment Act 1890,
places the law relating to this branch of insolvency procedure
upon a similar footing in both countries, so far as regards the
publicity of such deeds. The last-mentioned act also requires
a similar registration of all petitions for arrangement under
the Bankruptcy Act 1857.

Comparative Law

British Empire.—In most parts of the British empire the law
of bankruptcy has been modelled upon the English system.
This is particularly the case in Australia and New Zealand,
Victoria, South Australia, Western Australia and New Zealand
follow the lines of the existing English acts. In Queensland,
Tasmania and New South Wales the system is rather that of
the English act of 1860, leaving more to the creditors’ manage-
ment and less to officialism.

One point may be mentioned in which the Australian colonies
have improved on the English system. Under the English acts
a bankrupt is under no obligation to apply for his discharge.
The result is that the United Kingdom contains a population of
70,000 undischarged bankrupts—a manifest danger to the
trading community. Under the bankruptcy systems of New
South Wales, Victoria and New Zealand, a bankrupt is bound
to apply for his discharge within a fixed period, otherwise he
is guilty of a contempt of court.

In Canada, under the British North America Act 1867, the
Dominion parliament has exclusive legislative power in regard
to bankruptcy and insolvency: but there is no existing Dominion
act on the subject. A Dominion act was passed in 1875, but
repealed in 1880. The failure of this act may perhaps be ascribed
to the diversity of the pre-existing provincial systems, embracing
such contrasts as the English law of Ontario, and the French
code based on cesso bonorum—which ruled in Quebec.
Bankruptcy is dealt with in a fragmentary way by the provincial
legislatures by acts regulating such matters as priority of
execution creditors, fraudulent assignments and preferences,
imprisonment of debtors, administration of estates of deceased
insolvents.

In Cape Colony and Natal English law is substantially
followed. In the Transvaal, where Roman-Dutch law prevails,
the law governing the subject is the Insolvency Law, No. 13 of
1895. It provides for voluntary surrender and compulsory
sequestration. The law of the Orange River Colony is similar.

In British Guiana, Gambia, Jamaica, Hong Kong, Mauritius,
Grenada, Trinidad, Tobago and the Straits Settlements the law
is modelled on the English pattern.

In India insolvency is regulated by the Indian Insolvency Act
1868, extended by the Act XI. of 1889.

An English bankrupt, it may be added, is entitled to plead
his discharge in England as a defence in a colonial court. The
explanation is this. The English act vests all the bankrupt’s
property, whether in the United Kingdom or in the colonies,
in his trustee in bankruptcy. Having thus denuded him of every-
thing, it has been held to follow that the bankrupt’s discharge
must also receive recognition in a colonial court.

France.—Bankruptcy in France is regulated by the Commercial
Code of 1807, amended and supplemented by the law of 9th
June 1838. By Article 437 of the code bankruptcy is defined as
the state of a trader who is unable to meet his commercial
gagements. Simple insolvency of this kind is known in France
as faillite. Insolvency attended with circumstances of mis-
conduct or fraud is known as banqueroute simple or banqueroute
frauduleuse. Only a trader can become bankrupt. The debt,
too, for obtaining adjudication must be a commercial debt, the
laws regulating bankruptcy being designed exclusively for the
protection of commerce. To be made a bankrupt a trader need
not be insolvent: it is sufficient that he has suspended payment.
Commercial companies of all kinds are liable to be declared
bankrupt in the same manner as individual traders. A trader-
debtor can be adjudicated bankrupt upon his own petition, or
upon the petition of a creditor, or by the court itself proprio
motu. A petitioning debtor must within fifteen days file at the
office of the Tribunal of Commerce of the district, a declaration of suspension, with a true account of his conduct and of the state of his affairs, showing his assets, debts, profits and losses, and personal expenses. On adjudication the Tribunal of Commerce appoints a person, called a syndic provisoire, to manage the bankrupt's estate, and a juge commissaire is also named to supervise the syndic. A bankruptcy terminates by an ordinary composition (concordat), a sale of the debtor's assets (union), or a composition by relinquishment of assets. It is a striking feature of the French system, and highly creditable to French commercial integrity, that a discharge in bankruptcy, even when accompanied by a declaration d'excusabilité, leaves the unpaid balance a debt of honour. At the time of the French Revolution the National Convention passed a resolution that any man who contracted a debt should never be free from liability to pay it. The spirit of this resolution still survives, for until a trader has paid every penny that he owes he is not rehabilitated and remains under the stigma of various disabilities: he has no political rights, he cannot hold any public office, or act as a stockbroker, or sit on a jury. Bankruptcy simple is where the bankrupt has been guilty of grave faults in the conduct of his business, such as extravagance in living, hazzardous dealing, or the like; bankruptcy frauduleux involves the worse delinquency of fraud. Both bankruptcy simple and bankruptcy frauduleux are punishable, the latter with penal servitude ranging from five to twenty years.

Germany.—Bankruptcy in Germany is governed by a code passed in 1877. Prior to this each state had its own system and the law was “wholly chaotic.” The same distinction is drawn in Germany as in France between mere commercial failure and bankruptcy, simple or fraudulent. Simple bankruptcy is established by such offences as gambling, dealing in “futures,” disorderly book-keeping or extravagance in living: fraudulent bankruptcy, by offences of a deeper dye—the concealment of property, the falsifying of books, the manufacture of fictitious debts and the giving of illegal preferences. Both kinds of bankruptcy are punishable, fraudulent bankruptcy by penal servitude, or in case of mitigating circumstances, by imprisonment for not less than three months. Accessories in fraudulent bankruptcies are liable to penal servitude—for instance, a creditor who conspires with the debtor to secure an advantage to the prejudice of the other debtors. The creditors are called together within one month from the date of adjudication, and at their meeting they may appoint a committee of their number to advise with the trustee. It is the duty of the court to see that the trustee performs his functions. Estates are liquidated with great rapidity. In order that the creditors may receive dividends at the earliest moment, it is customary to sell the assets by auction. The creditors by a majority in number and three-fourths in value may accept a composition, but such an arrangement must have the approval of the court. The fees are very moderate: in an ordinary bankruptcy the attorney’s fees do not, it is said, exceed £5.

Italy.—Bankruptcy in Italy is regulated by the Commercial Code of 1883 (Part III.). Only merchants can pass through the bankruptcy court. Merchants are defined by the code as those who, as an habitual profession, engage in commercial business. This definition includes merchant companies. Bankruptcy proceedings may be taken either by the debtor or by a creditor for a commercial debt, or may be ordered by the court. The amount of the debt is immaterial: a small sum will suffice, provided its non-payment is proof of insolvency. Bankruptcy can only be declared where there is insolvency. The judgment adjudicating a debtor bankrupt deprives the bankrupt of the right to administer his affairs, and nominates a trustee to realize the property under the superintendence of a judge and a commission of creditors. All the property of the bankrupt, movable and immovable, is sold by auction and distributed in dividends. This is one way of closing the bankruptcy, but it may also be closed by an arrangement. No minimum percentage is required for such arrangement, but it must have the assent of creditors representing three-fourths of the bankrupt’s indebtedness. Composition before bankruptcy is not recognized by Italian law. Bankrupts are liable to criminal proceedings involving punishments more or less heavy for offences against the law, e.g., for not keeping books in the way prescribed by law.

United States.—After much fragmentary legislation the bankruptcy system of the United States is now embodied in the National Bankruptcy Act of 1898, as amended by the act of 1903. The acts of bankruptcy under the act may be summarized as follows: where a debtor (1) removes any of his property to hinder or delay his creditors; (2) being insolvent, transfers property with intent to prefer a creditor; (3) suffers any creditor to obtain a preference; (4) makes a general assignment for the benefit of his creditors; (5) “admits in writing his inability to pay his debts and his willingness to be adjudicated a bankrupt on that ground.” These acts of bankruptcy do not include, it will be observed, non-payment by a debtor of his debts. A debtor can therefore only be adjudicated a bankrupt on the ground of indebtedness with his own consent in writing. Presumably the legislature thought that the desire to obtain the protection and privilege of bankruptcy would be a sufficient inducement to confess insolvency, where such insolvency, in fact, existed.

To constitute a fraudulent preference it is not necessary, as it is under English law, that the payment should be made "with a view to prefer" the favoured creditor. It is enough that the creditor is preferred. This avoids the nice questions of legal casuistry which have embarrassed the English courts, and it is the more rational rule, for creditors are not concerned with a debtor's intention. Any person, trader or non-trader, may avail himself of the act, but, in the case of a corporation, there is this peculiarity: it may be petitioned against but cannot petition.

Insolvency is construed in a practical sense; that is, a person is insolvent where the aggregate of his property, at a fair valuation, is insufficient to pay his debts; but he is not necessarily insolvent because his realized assets are insufficient to meet his liabilities.

Involuntary proceedings can only be taken against debtors owing $1000 or over, with certain exceptions. A petitioning creditor's debt must amount to $500.

The administration of the law of bankruptcy is entrusted to the district courts and is exercised through the medium of certain officers appointed by the courts and called referees. The creditors appoint a trustee or trustees of the estate.

So soon as his judicial examination is over the bankrupt may offer his creditors a composition, but to take effect the composition must be approved by the court after hearing objections.

The discharge is the key to the efficiency of every bankruptcy system. By the control which the court thus holds, it is enabled to bring its moral censorship to bear on a debtor's conduct and so maintain a high standard of commercial integrity. Under the United States system the judge is to investigate the merits of the application and to discharge the bankrupt, unless he has (1) committed an offence punishable by imprisonment; (2) with intent to conceal his financial condition, destroyed, concealed, or failed to keep books of account or records from which his condition might be ascertained; or (3) obtained property on credit from any person upon a materially false statement in writing made to such person for the purpose of obtaining such property on credit; or (4) at any time, subsequent to the first day of the four months immediately preceding the filing of the petition, transferred, removed, destroyed or concealed any of his property with intent to hinder, delay or defraud his creditors; or (5) in voluntary proceedings been granted a discharge in bankruptcy within six years; or (6) in the course of proceedings in bankruptcy refused to obey any lawful order of or to answer any material question approved by the court.

It is significant that the italicized qualifications were added to the act of 1898 by the experience of five years of its working.

(E. MA.)
BANKS, GEORGE LINNAEUS (1821-1881), British miscellaneous writer, was born at Birmingham on the 2nd of March 1821. After a brief experience in a variety of trades, he became, at the age of seventeen a contributor to various newspapers, and subsequently a playwright, being the author of two plays, a couple of burlesques and several lyrics. Between 1848 and 1864 he edited in succession a variety of newspapers, including the Birmingham Mercury and the Dublin Daily Express, and published several volumes of miscellaneous prose and verse. He died in London on the 3rd of May 1881.

BANKS, SIR JOSEPH, Bart. (1743-1820), English naturalist, was born in Argyle Street, London, on the 13th of February 1743. His father, William Banks, was the son of a successful Lincolnshire doctor, who became sheriff of his county, and represented Peterborough in parliament; and Joseph was brought up as the son of a rich man. In 1760 he went to Oxford, where he showed a decided taste for natural science and was the means of introducing botanical lectures into the university. In 1764 he came into possession of the ample fortune left by his father, and in 1766 he made his first scientific expedition to Newfoundland and Labrador, bringing back a rich collection of plants and insects. Shortly after his return, Captain Cook was sent by the government to the Pacific region, and Banks, through the influence of his friend Lord Sandwich, obtained leave to join the expedition in the "Endeavour," which was fitted out at his own expense. He made the most careful preparations, in order to be able to profit by every opportunity, and induced Dr Daniel Solander, a distinguished pupil of Linnaeus, to accompany him. He even engaged draughtsmen and painters to delineate such objects of interest as did not admit of being transported or preserved. The voyage occupied three years and many hardships had to be undergone; but the rich harvest of discovery was more than adequate compensation.

Banks was equally anxious to join Cook's second expedition and expended large sums in engaging assistants and furnishing the necessary equipment; but circumstances obliged him to relinquish his purpose. He, however, employed the assistants and materials he had collected in a voyage to Iceland in 1772, returning by the Hebrides and Staffa. In 1778 Banks succeeded Sir John Pringle as president of the Royal Society, of which he had been a fellow from 1766, and held the office until his death. In 1781 he was made a baronet; in 1795 he received the order of the Garter, and in 1797 the degree of doctor of laws. He died at Isleworth on the 19th of June 1820. As president of the Royal Society he did much to raise the state of science in Britain, and was at the same time most assiduous and successful in cultivating friendly relations with scientific men of all nations. It was, however, objected to him that from his own predilections he was inclined to overlook and depreciate the labours of the mathematical and physical sections of the Royal Society and that he exercised his authority somewhat despotically. He bequeathed his collections of books and botanical specimens to the British Museum. His fame rests rather on what his liberality enabled other workers to do than on his own achievements.

BANKS, NATHANIEL PRENTISS (1816-1864), American politician and soldier, was born at Waltham, Massachusetts, on the 30th of January 1816. He received only a common school education and at an early age began work as a bobbin-boy in a cotton factory of which his father was superintendent. Subsequently he edited a weekly paper at Waltham, studied law and was admitted to the bar, his energy and his ability as a public speaker soon winning him distinction. He served as a Free Soiler in the Massachusetts legislature from 1849 to 1853, and was speaker in 1851 and 1852; he was president of the state Constitutional Convention of 1853, and in the same year was elected to the national House of Representatives as a coalition candidate of Democrats and Free Soilers. Although re-elected in 1854 as an American or "Know-Nothing," he soon left this party, and in 1855 presided over a Republican convention in Massachusetts. At the opening of the Thirty-Fourth Congress the anti-Nebraska men gradually united in supporting Banks for speaker, and after one of the bitterest and most protracted speakership contests in the history of Congress, lasting from the 3rd of December 1855 to the end of February 1856, he was chosen on the 133rd ballot. This has been called the first national victory of the Republican party. Re-elected in 1856 as a Republican, he resigned his seat in December 1857, and was governor of Massachusetts from 1858 to 1861, a period marked by notable administrative and educational reforms. He then succeeded George B. McClellan as governor of the Illinois Central railway. Although governor he had been a strong advocate of peace, he was one of the earliest to offer his services to President Lincoln, who appointed him in 1861 major-general of volunteers. Banks was one of the most prominent of the volunteer officers. When McClellan entered upon his Peninsular Campaign in 1862 the important duty of defending Washington from the army of "Stone wall" Jackson fell to the corps commanded by Banks. In the spring Banks was ordered to move against Jackson in the Shenandoah Valley, but the latter with superior forces defeated him at Winchester, Virginia, on the 25th of May, and forced him back to the Potomac river. On the 9th of August Banks again encountered Jackson at Cedar Mountain, and, though greatly outnumbered, succeeded in inflicting on the enemy a very severe loss in a sanguinary battle. He was later to succeed in command of the garrison at Washington, and in November sailed from New York with a strong force to replace General B. F. Butler at New Orleans as commander of the Department of the Gulf. Being ordered to co-operate with Grant, who was then before Vicksburg, he invested the defences of Port Hudson, Louisiana, in May 1863, and after three attempts to carry the works by storm he began a regular siege. The garrison surrendered to Banks on the 4th of July, on receiving word that Vicksburg had fallen. In the autumn of 1863 Banks organized a number of expeditions to Texas, chiefly for the purpose of preventing the French from aiding the Confederates, and securing possession of the region near the mouths of the Nueces and the Rio Grande. But his Red River expedition, March-May 1864, forced him by superior authority, was a complete failure. In August 1865 he was mustered out of the service, and from 1865 to 1873 he was again a representative in congress, serving as chairman of the committee on foreign affairs. A personal quarrel with President Grant led in 1872, however, to his joining the Liberal-Republican revolt in support of Horace Greeley, and as the Liberal-Republican candidate, was defeated for re-election. In 1874 he was successful as a Democratic candidate for a single term (1875-1877). Having rejoined the Republican party in 1876, he was United States marshal for Massachusetts from 1879 until 1888, when for the ninth time he was elected to Congress. He retired at the close of his term (1881) and died at Waltham on the 1st of September 1894.

BANKS, THOMAS (1735-1805), English sculptor, son of a surveyor who was land steward to the duke of Beaufort, was born in London on the 20th of December 1735. He was taught drawing by his father, and in 1750 was apprenticed to a wood-carver. In his spare time he worked at sculpture, and before 1772, when he obtained a travelling studentship and proceeded to Rome, he had already exhibited several fine works. Returning to England in 1779 he found that the taste for classic poetry, ever the source of his inspiration, no longer existed, and he spent two years in St Petersburg, being employed by the emperor Catherine, who purchased his "Cupid tormenting a Butterfly." On his return he modelled his colossal "Achilles mourning the loss of Briseis," a work full of force and passion; and thereupon he took the name of Banks. In 1781 he was admitted a Fellow of the Royal Academy and in the following year a full member. Among other works in St Paul's cathedral are the monuments to Captain Westcott and Captain Burges, and in Westminster Abbey to Sir Eyre Coote. His bust of Warren Hastings is in the National Portrait Gallery. Banks's best-known work is perhaps the colossal group of "Shakespeare attended by Painting and Poetry," now in the garden of New Place, Stratford-on-Avon. He died in London on the 2nd of February 1805.
BANKS AND BANKING. The word “bank,” in the economic sense, covers various meanings which all express one object, a contribution of money for a common purpose. Thus Bacon, in his essay on "Usury," while explaining "how the discommodities of it may be best avoided and the commodities retained," refers to a "bank or common stock" as an expression with which his readers would be familiar. Originally connected with the idea of a mound or bank of earth—hence with that of a "monte," an Italian word describing a heap—the term has been gradually applied to several classes of institutions established for the general purpose of dealing with money.

The manner in which a bank prospers is explained by David Ricardo, in his "Proposals for an Economical and Secure Currency," in a passage where he tells us that a bank would never be established if it obtained no other profits but those derived from the employment of its own capital. The real advantage of a bank to the community it serves commences only when it employs the capital of others. The money which a bank controls in the form of the deposits which it receives and sometimes of the notes which it issues, is loaned out by it again to those who desire to borrow and can show that they may be trusted. A bank, in order to carry on business successfully, must possess a capital of its own, to give it the standing which will enable it to collect capital belonging to others. But this it does not hoard. It only holds the funds with which it is entrusted till it can use them, and the use is found in the advances that it makes. Some of the deposits merely lie with the bank till the customer draws what he requires for his ordinary everyday wants. Some, the greater part by far, of the deposits enable the bank to make advances to men who employ the funds with which they are entrusted in reproductive industry, that is to say, in a manner which not only brings back a greater value than the amount originally lent to them, but assists the business development of the country by setting on foot and maintaining enterprises of a profitable description. It is possible that some part may be employed in loans required through extravagance on the part of the borrower, but these can only be a small proportion of the whole, as it is only through reproductive industry that the capital advanced by a banker can really be replaced. A loan, sometimes, it is true, is repaid from the profits of the business in which it is invested, but only means a transfer of capital from one hand to another; money that is not transferred in this way must be made by its owner. Granted that the security is complete, there is only one absolute rule as to loans if a bank desires to conduct its business on safe lines, that the advance should not be of fixed but of floating capital. Nothing seems simpler than such a business, but no business requires closer attention or more strong sense and prudence in its conduct. In other ways also, besides making loans, a well-conducted bank is of much service to the business prosperity of a country, as for example by providing facilities for the ready transmission of money from those who owe money to those to whom it is due. This is particularly obvious when the debtor lives in one town or district and the creditor in another at a considerable distance, but the convenience is very great under any circumstances. Where an easy method of transmission of cash does not exist, we become aware that a "rate of exchange" exists as truly between one place and another in the same country as between two places in different countries. The assistance that banking gives to the industries of a community, apart from these facilities, is constant and most valuable.

With these preliminary remarks on some main features of the business, we may pass on to a sketch of the history of modern banking. Banks in Europe from the 16th century onwards may be divided into two classes, the one described as "exchange banks," the other as "banks of deposits."

These last are banks which, besides receiving deposits, make loans, and thus associate themselves with the trade and general industries of a country. The exchange banks included in former years institutions like the Bank of Hamburg and the Bank of Amsterdam. These were established to deal with foreign exchange and to facilitate trade with other countries. The others—founded at very different dates—were established as, or early became, banks of deposit, like the Bank of England, the Bank of Venice, the Bank of Sweden, the Bank of France, the Bank of Germany and others. Some reference to these will be made later. The exchange banks claim the first attention. Important as they were in their day, the period of their activity is now generally past, and the interest in their operations has become mainly historical.

In one respect, and that a very important one, the business carried on by the exchange banks differed from banking as generally understood at the present time. No exchange bank had a capital of its own nor did it require any for the performance of the business. The object for which exchange banks were established was to turn the values with which they were entrusted into "current money," "bank money" as it was called, that is to say, into a currency which was accepted immediately by merchants without the necessity of testing the value of the coin or the bullion brought to them. The "value" they provided was equal to the "value" they received, the only difference being the amount of the small charge they made to their customers, who gained by dealing with them more than equivalent advantages.

The Bank of Amsterdam, which was one of the most important, and of the Bank of Hamburg, which survived the longest, its existence not terminating till 1873, will suffice to explain the working of these institutions.

The Amsterdamseche Wisselbank, or exchange bank, known later as the Bank of Amsterdam, was established by the ordinance of the city of Amsterdam of 31st January 1600. The increased commerce of Holland, which made Amsterdam a leading city in international dealings, led to the establishment of this bank, to which any person might bring money or bullion for deposit, and might withdraw at pleasure the money or the worth of the bullion. The ordinance which established the bank further required that all bills of 600 gulden (£50), or upwards—this limit was, in 1643, lowered to 300 gulden (£25)—should be paid through the bank, or in other words, by the transfer of deposits or credits at the bank. These transfers came afterwards to be known as "bank money.

The charge for making the transfers was the sole source of income to the bank. The bank was at first endowed with a capital of its own, being understood to have actually in its vaults the whole amount of specie which "bank money" was outstanding. This regulation was not, however, strictly observed. Loans were made at various dates to the Dutch East India Company. In 1795 a report was issued showing that the city of Amsterdam was largely indebted to the bank, which held as security the obligations of the states of Holland and West Friesland. The debt was paid, but it was too late to revive the bank, and in 1820 "the establishment which for generations had held the leading place in European commerce ceased to exist." (See Chapters on the Theory and History of Banking, by Charles F. Dunbar, p. 105.)

Similar banks had been established in Middelburg (March 28th, 1618), in Hamburg (1616) and in Rotterdam (February 9th, 1615). Of these the Bank of Hamburg carried on much the largest business and survived the longest. It was not till the 15th of February 1873 that its existence was closed by the act of the German parliament which decreed that Germany should possess a gold standard, and thus removed those conditions of the local medium of exchange—silver coins of very different intrinsic values—which circulation had provided an ample field for the operations of the bank. The business of the Bank of Hamburg had been conducted in absolute accordance with the regulations under which it was founded.

The exchange banks were established to remedy the inconvenience to which merchants were subject through the uncertain value of the currency of other countries in reference to that of the city where the exchange bank carried on its business. The following quotation from Notes on Banking, written in 1873, explains the method of operation in Hamburg. "In this city, the most vigorous offshoot of the once powerful Hansa, the latest representative of the free commercial cities of medieval Europe,
there still remains a representative of those older banks which
were once of the highest importance in commercial affairs.
Similar conditions greatly aided the prosperity of Venice,
Genua, Amsterdam and Nuremberg. The Bank of Hamburg
is now the last survivor of these banks, whose business lay in the
assistance of commerce, not by loans, but by the local manufacture,
so to speak, of an international coinage. In a city of the highest
rank of commercial activity, but greatly circumscribed in territory,
continually receiving payments for merchandise in the coin of
other countries, a common standard of value was a matter of
primary necessity. The invention of bank money, that is, of
money of account which could be transferred at pleasure from
one holder to another, enabled the trade of the place to be carried
on without any of those hindrances to business which must have
followed on the delay and expense attendant on the verification
of various coins differing from each other in weight, intrinsic
value, standard of purity of metal, in every point in fact in which
coins can differ from each other. By supplying a currency of
universal acceptance the Bank of Hamburg greatly contributed
to the prosperity of that city." The regulations being strictly
carried on the currency was purely metallic; the "Mark Banco"
being merely the representative of an equal value of silver.
For the earliest example of a bank for the receipt of deposits
carrying on a business on modern lines, we must turn, as in the
case of the exchange banks, to a great commercial city of the
middle ages. Private banking in Venice began as an adjunct of the
business of the campores or dealers in foreign moneys.
"As early as 1270 it was deemed necessary to require them to
give security to the government as the condition of carrying on
their business, but it is not shown that they were then receiving
deposits. In an act of the 24th of September 1318, however,
ettled Bancheri scriptae de soli pellergias consultius, the receipt
of deposits by the campores is recognized as an existing practice,
and provision is made for better security for the depositors."
From this it becomes clear that between 1270 and 1318 the
money-changers of Venice were becoming bankers, just as the
same class of men became in Amsterdam a couple of centuries
later, and as later still the goldsmiths in London.

Of the early banks in Europe, the bank in Venice, the Banco
di Rialto, was established by the acts of the Venetian senate of
1584 and 1587. This appears to have been the first
public bank in that city and in Europe. The senate
by the act of the 3rd of May 1619\(^1\) established by the
side of the Banco di Rialto a second public bank
known as the Banco Giro, or Banco del Giro, which ultimately
became the only public bank of the city and was for generations
famous throughout Europe as the Bank of Venice. Earlier than
this the campores or dealers in foreign moneys had carried on
the business. The Bank of Venice (Banco del Giro) appears to
have been called into existence by the natural developments of
trade, but some banks have been established by governments and
have been of great service to the development of the countries
in which they have carried on their business. Of these, the Bank
of Sweden (the Riksbank) established in 1668, is the earliest.
This bank still exists and has always been the state bank of Sweden.
It was founded by a Swede named Palmstruck, who
also invented the use of the bank note—perhaps adapted for use
in Europe is the better expression to employ, as notes were
current in China about A.D. 800. The first bank note was issued
by the Riksbank in 1658. An enquete made by the French
government in 1729 recognizes the priority of Sweden in this
matter, and declares the bank note to be an admirable Swedish
invention, designed to facilitate commerce.

EUROPEAN COUNTRIES

United Kingdom.—English banking may be traced back to
the dealings in money carried on by the goldsmiths of London
and thus certainly to the 16th century; but it has been so greatly
influenced by the working of the Bank of England and by the
acts of parliament connected with that institution, that a
reference to this bank's foundation and development must precede
any attempt at a detailed history of banking in the

\(^{1}\) A translation of the act of the 3rd of May 1619 may be found in an
appendix to the Quarterly Journal of Economics (Boston,
U.S.A.) for April 1902. These documents present a distinct picture
of banking in its true sense.

\(^{1}\) The clearest account of its early days is found in Thorold
BANKS AND BANKING [BRITISH]

The date 1876 is taken as being that when the Imperial Bank of Germany came into full operation.

1 The date 1876 is taken as being that when the Imperial Bank of Germany came into full operation.
Besides the banks in London already mentioned, one in the provinces claims to have been established before the Bank of England. Smiths of Nottingham, since amalgamated with the Union of London Bank, is stated to have been founded in 1688. Others also claim considerable antiquity. The old Bank of Bristol (Bailey, Cave & Co.) was founded in 1750; the business amalgamated with Prescott & Co., Ltd., of London. The Hull Old Bank (Pesse & Co.) dated from 1754; this business also still continues (amalgamated, 1894, with the York Union Banking Co., Ltd., and since with Barclay & Co., Ltd.). The banks of Gurney & Co., established at the end of the 18th century in the eastern counties, have with numerous other banks of similar standing amalgamated with the firm of Barclay & Co., Ltd., of Lombard Street.

To the business of banking had been carried on by the goldsmiths of the city, who took deposits from the time of James I. onwards, and thus established "deposit-banking" as early as that reign. This is described in a pamphlet published in 1676, entitled The Mystery of the New-Formed Goldsmiths or Bankers Discovered, quoted by Adam Anderson in his History of the Great Commercial Interests of the British Empire (vol. ii. p. 402). During the Civil War the goldsmiths or new-fashioned bankers began to receive the rents of gentlemen's estates remitted to town, and to allow them and others who put cash into their hands some interest for it, if it remained but for a single month in their hands, or even a lesser time. This was a great allurement for people to put their money into their hands, which would bear interest till the day they wanted it. And they could also draw it out by £100 or £50, &c., at a time, as they wanted it, with infinitely less trouble than if they had lent it out on either real or personal security. The consequence was that it quickly brought a great quantity of cash into their hands; so that the chief or greatest of them were now enabled to supply Cromwell with money in advance on the revenues as his occasion required, upon great advantage to themselves."

The Bank of England, as stated before, was incorporated by the act of 1694. The position of the other banks at that time was defined by that act and the act of 1697, which declared that no note not issued by a joint-stock bank, was "to be issued within England during the continuance of the Bank of England," and also by the act of 1768, which provided that "during the continuance of the Bank of England, no company or partnership exceeding six persons in England " should " borrow, owe or take up any sum or sums of money on their bills or notes payable on demand or at any less time than six months from the borrowing thereof." This was confirmed by the act of 1800. No change of importance was made till the act of 1826, which prohibited "bank notes under £5;" and the second Banking Act of that year which allowed the establishment of co-partnerships of more than six persons, which necessarily were joint-stock companies, beyond 65 m. from London. The act of 1833 allowed the establishment of joint-stock banks within the 65 m. limit, and took away various restrictions of the amounts of notes for less than £50. But the power of issuing notes was not allowed to joint-stock banks within the 65 m. radius.

In the early days in England, issuing notes formed, as Bagheyt says in his Lombard Street, the introduction to the system of deposit-banking—so much so, that a bank which had not the power of issuing notes could scarcely exist out of London.

Bank notes in England originated in goldsmiths' notes. Goldsmiths received deposits of moneys and gave notes or receipts for such moneys payable on demand. The London bankers continued to give their customers notes or deposit-receipts for the sums left by them until about 1751, when in lieu of such notes they gave them books of cheques. Before the invention of cheque-books, the practice of issuing notes was considered so essentially the main feature of banking, that a prohibition of issue was considered an effectual bar against banking. Accordingly the prohibitory clause in the act of 6 Anne, c. 50, 1707 (in Record edition), which was repeated in the Bank of England Act 1708, 7 Anne, c. 30, § 66 (in Record edition), prohibiting more than six persons from issuing promissory notes, was intended to prevent any bank being formed with more than six partners, and was so understood at the time; and it did have the effect of preventing any joint-stock bank being formed.

The prohibition, as already related, was modified in the year 1826 and removed in 1833. Even then the privilege of limitation of liability was not permitted to any other bank but the Bank of England. The result was that when joint-stock banks were first formed many persons of good means were kept back from becoming shareholders, that is to say partners, in banks. For up to the date of the act of 1862 permitting "limited liability," every shareholder in a joint-stock bank was liable to the extent of the whole of his means (see the article COMPANY). Even as late as 1858 when the Western Bank of Scotland and 1878 when the City of Glasgow Bank failed, very great hardship was inflicted on many persons who had trusted with over confidence to the management of those banks. The failure of the City of Glasgow Bank was the cause of the Companies Act of 1856, passed to enable unlimited companies to adopt limited liability. In limited companies the shareholder who has paid up the nominal amount of his holding is not liable for any further amount, unless the company issues bank notes, in which case the shareholders are liable in the same way as if the company were registered as an unlimited company. The facilities allowed by this act were used by almost every joint-stock bank in the United Kingdom except those banks which were at that date limited by charter or by special act.

To return to the early history of banking—thus, as no bank could be formed with more than six partners during the whole of the period from 1694 to 1826 and 1833, the majority of the banks formed throughout England and Wales for more than a century were necessarily small and usually isolated firms. Further, when a partner died, his capital not infrequently went out of the business; then a fresh partner with sufficient means had to be found, constant change was the result, and confidence, "a plant of slow growth," could not thrive, except in those instances when a son or a relation filled the vacancy. The banks in the country districts had frequently branches in the small market-towns close to them; those in London had never more than one office. These banks were sometimes powerful and generally well managed, a considerable number being established by members of the Society of Friends.

The restriction of partners in private banks to the number of six continued till 1862. By the act of that year they were allowed to be ten. This power, however, did not extend to issuing private banks, which were restricted to six partners as before. The power of increasing bank partnerships to ten has been made but little use of. The difficulties of carrying on business on a large scale by private firms were augmented by certain legal technicalities which practically rendered large private banks impossible in ordinary circumstances. Hence banking business did not begin to assume its present form till almost half-way through the 19th century. The gradual change followed the passing of the acts of 1826-1833, of 1844-1845, of 1862 and of 1879. Incidentally the act of 1844 had an unexpected influence on the constitution of the banking system. After favouring the existence of small banks for many years, it gradually led, as the time arrived when the establishment of large and powerful banks in England and Wales became necessary, to their formation. No new bank of issue whatever was allowed to be established—restrictions were placed on the English issuing banks—private issuing banks with not more than six partners were allowed to remain, to amalgamate with other private issuing banks and to retain their joint issues. The joint-stock banks which possessed issues were also allowed to continue these, but when two joint-stock banks amalgamated, the continuing bank only retained its issue. Also when a private issuing bank was formed into or joined a joint-stock bank, the issue lapsed.

The greater number of the provincial banks in England and Wales had been banks of issue up to 1844. The act of 1844
restricted their power of issuing notes, which at that date and even subsequently continued to be of importance to them, in such a manner that, as Sir R. H. Inglis, the legislature before the committee of the House of Commons at the banking inquiry of 1875, these banks possessed in their issues a proportion they could use, but were not able to sell. The statistics forming part of Appendix 14 to the report of the select committee of the House of Commons on banks of issue (1875) give interesting information as to the proportion of notes in circulation to the deposits of banks in various districts of the country and at various dates. The statements were supplied by twenty-one banks, some in agricultural districts, some in places where manufactures flourished, some in mixed districts, commercial and agricultural, or industrial and manufacturing. In all of these, the inquiry being carried as far back as 1844, the proportion of the circulation to the banking deposits had greatly diminished in recent years. In several cases the deposits had increased three-fold in the time. In one case it was five times as large, in another nearly seven times, in another nearly twelve and a half times. The proportion of the circulation to the deposits had very largely diminished in that time. In one instance, from being about one-third of the deposits, at which proportion it had remained for five years consecutively, it fell to 9% at the end of the term. In another from being 2% it had diminished to 1% of the total. In all cases where the details were given it had diminished greatly.

The Bank Act of 1842 was arranged with the intention of concentrating the note issues on the banking of England in order to secure the monopoly of that bank as the one issuer in England and Wales. The result was that nearly all the provincial banks in England had by 1906 lost the right of issue. Doubtless all were destined to do so before long, a result by which banking in England and the industries of the country must lose the advantage which the local issues have been to Scotland and Ireland. Had the English country banks been allowed, as the Scottish banks were, to associate together and to retain their issues, powerful banks would many years since have been established throughout England and Wales, and the amalgamations of recent years would have been carried through at a much earlier date, and on terms much more favourable to the public.

No security was ever required to be given for the local issues in the United Kingdom. The provisions of the acts of 1842-1845 which compelled the Irish and Scottish banks to hold specie against the notes issued beyond the legal limit, do not make the coin held a security for them. The note issue of these countries may be made the note-issuers a first charge, with unlimited liability, on the total assets of the joint-stock banks which accepted the principle of limited liability for the rest of their business; has been the only recognition by the state of the duty to the note-holders of rendering them secure.

It has been a real disadvantage to England that this duty has never been sufficiently recognized, and that the provincial note issue, which is a very convenient power for a bank to possess, and incidentally a considerable advantage to its customers, has been swept away without any attempt being made to remedy its deficiencies. There may be objections raised to a note circulation secured by the bonds of the government, but the security of the note issues of the national banks of the United States made against such bonds, has scarcely ever been questioned.

A different policy was followed by Sir Robert Peel in Scotland and in Ireland from that which he established in England. By the acts of 1842-1845 the Scottish and Irish banks were allowed to exceed their authorized issues on holding specie to the amount of the excess, and no restrictions were placed on amalgamations among banks in these countries. In Scotland and in Ireland the note issues for less than £5 continued to be allowed. The result has been that the ten large banks in Scotland, and of the nine banks in Ireland, possess the power of issuing notes. The large proportion of local branches in these countries has been greatly assisted by this power.

Originally, besides the Bank of England, nearly all the provincial banks in England and Wales possessed the privilege of issue. These banks continued their operations as previously described for the time while the Bank Act was in force. So many new joint-stock banks were created that, after the 12th of October 1844, when the act came into operation, 67 joint-stock banks with an authorized issue of £5,153,417 and 12 private banks with an authorized issue of £3,478,230 were registered.

The actual circulation of the country in October 1844 was as follows:

<table>

This shows an apparent increase of more than £6,000,000 since 1844. The decrease of the country circulation in England and the increase of the Scottish and Irish circulations may be set off against each other. The increase is mainly in the notes of the Bank of England. In 1844 the number of banking offices in England and Wales was 976, while in 1906 there were more than 5860. Each of these offices must hold some till-money, and of this Bank of England notes almost always form a part. Hence it is probable that a large part of the circulation of the Bank of England since 1844 is held in the tills of the banks in England and Wales, and that the active note circulation of the United Kingdom is but little larger than it was.

It may be added that the government received from the note circulation for a typical year (ending 5th of April 1904), out of the profits of issue (Bank of England) £184,930, 2s. 2d., and also composition for the duties on the bills and notes of the banks of England and Ireland, and of country bankers, £120,768, 18s. 6d. In 1846 the business of England was carried on practically by about ten private and sixty joint-stock banks of which more than one was properly a private firm under a joint-stock form of organization. Though the number of individual banks had diminished, the offices had greatly increased.

The records of the numbers of banks in the United Kingdom have up to quite recent years been very imperfect. Such as exist were made by individual observers. The banks of England and Wales are believed to have been 350 in number in 1792. Those registered from 1826 to 1842 were:
BANKS AND BANKING

In the latter years of the 18th century and the early years of the 19th, the note circulation was a very important part of the business, but about that date the deposits began to be, as they were continued, since, far more important. It is unfortunately impossible to give any trustworthy statistics of the position of banking in the United Kingdom extending back for more than forty or fifty years. Even the Scottish banks, who have been less reticent as to their position than the English banks, did not publish their accounts accurately till 1854. The figures of the total deposits and cash balances in the Irish joint-stock banks were published collectively from the year 1810 by the care of Dr Neilson Hancox, but it is only of quite recent years that any statement of the general position other than an estimate has been possible owing to the long-continued reluctance of many banks to allow any publication of their balance-sheets. A paper by W. Newmarch, printed in the Journal of the Statistical Society for 1851, supplies the earliest basis for a trustworthy estimate. According to this the total amount of deposits, including the Bank of England, in England and Wales, Scotland and Ireland, may have been at that date from £250,000,000 to £300,000,000. The estimate in Palgrave's Notes on Banking (1872), excluding deposits in discount houses and the capitals of banks, was from £330,000,000 to £450,000,000. The corresponding amounts at the close of 1866 were, in round figures, including acceptances &c., £907,000,000. The total reserves, including capitals and reserves and note circulation (in round figures £1,777,500,000), were for 1866—

The progressive growth in bank deposits since it has been possible to keep a record of their amounts, affords some means of checking roughly the correctness of the estimates of 1851 and 1872. Broadly speaking, it may be said that the bank deposits of the United Kingdom have about doubled since 1872.

The purely city banks had associated themselves in a "Clearing House" certainly by 1776. An entry in the books of the Grasshopper, namely—"1773 to quarterly charge for use of the Clearing-room of 16/6d.," points to an earlier and perhaps less definitely organized system of settlement. A house was taken for the purpose in 1810, in which year the number of banking houses who settled their accounts with each other at the "Clearing House" was forty-six (Gilbart's History and Principles of Banking, p. 28). The Bank of England has never been a member of the Clearing House, though it "clears on one side," i.e. its claim on the clearing bankers is made through the Clearing House, but the claims of the clearing bankers on the bank are forwarded direct to Threadneedle Street twice or thrice daily. Nor did the banks in Fleet Street or at Charing Cross belong to it. In 1848 the clearing of country cheques was added through arrangements made by Lord Aveybury, then Sir John Lubbock. The "country clearing" is a great assistance to business, as it enables a cheque drawn on the most distant village in England to be dealt with as conveniently as a cheque on London. Of the forty-nine banks in London in 1844, twenty-six were connected with the Clearing House. At that time only private banks were allowed to be members. In 1854 the joint-stock banks made their way into that body, and in 1906 the numbers were one private bank and fourteen joint-stock banks who joined in the clearing—nineteen banks in all.

Practically at the present time every large transaction in the United Kingdom is settled by cheque, that is, by a series of ledger transfers, notes and specie being but the small change by which the fractional amounts are paid. A large proportion of these transactions are arranged through the operation of the London Clearing House. This is facilitated by the fact that every bank in the United Kingdom has an agent in London.

The annual circulation shown by the London Clearing House is more than £12,000,000,000. No one asks what stock of gold is held by the bank on which the cheques are drawn, or what the bank itself keeps in reserve. The whole is taken in that fairly and well-founded trust. It is the most easily worked paper circulation and circulating medium in existence. Like the marvellous tent of the fairy Paribanou, it expands itself to meet every want and contract again the moment the strain is passed. (See the article by R. H. Inglis Palgrave on "Gold and the Banks," Quarterly Review, January 1906.)

If we add to the returns of the London Clearing House those of the provincial clearing houses of the large towns in England, Ireland and Scotland, and the numerous exchanges which occur daily, and the large number which the different offices of banks with a great many branches settle among themselves, and the number drawn by one customer of a bank and paid to another, we may form some notion of the strain on the weekly turnover in cheques. This may be roughly estimated to be at least twice as great as that registered by the London Clearing House. The earliest authentic statement as to the clearing is found in the Appendix to the Second Report, Committee of House of Commons, Banks of Issue (1841). In 1839 the figures of the London clearings were—

In 1865, shortly after the establishment of the Bank of England, the Scottish parliament passed an act for the establishment of a public bank. Amongst the first names is that of Thomas Coutts, a name still commemorated in one of the most substantial banks in London. The terms of the establishment were more favourable than those connected with the establishment of the Bank of England, for they obtained the exclusive privilege of banking for twenty-one years without giving any consideration whatever. It may have been the natural caution of the country, or the fact that William III. was then king, which led to the Bank of Scotland being prohibited under a heavy penalty from lending money under any circumstances to the king. It is the only Scottish bank established by act of parliament. The directors began at a very early period to receive deposits and to allow interest thereon, also to grant cash credit accounts, a minute of the directors respecting the mode of keeping the latter being dated so far back as 1729.

Though the system of branches forms now so marked a feature of banking in Scotland, a good many years had to pass before they obtained any hold. It was not till about the year 1700 that the directors of the Bank of Scotland established branches at Glasgow, Aberdeen, Dundee and Montrose, but so little encouragement was given to these branches, the expenses far exceeding the profits arising from them, that the directors resolved to close them. In 1731 another attempt was made, and agencies were established at Glasgow, Aberdeen and Dundee. But after a trial of two years they were discontinued. It was not till 1774 that branches were again established by the bank.

Soon after the establishment of the Bank of Scotland the directors began to issue notes, or, as they were then called, bills or tickets, for £100, £50, £20, £10, and £5. In 1704 £1 notes were issued for the first time. In 1777 the Royal Bank of Scotland was established by a charter of incorporation,—which granted them "perpetual succession and a common seal." There was a great rivalry between the two companies. The British Linen Company was incorporated in 1746 for the
purpose of undertaking the manufacture of linen, but by 1763 they found it best to confine their operations to banking transactions. This bank also was incorporated by charter.

The note circulation was always an important item in the Scottish banks. Thus in the case of the Bank of Dundee, the receiving money from the public did not commence till 1792. Up to that time the whole business of the bank from 1764 onwards, twenty-eight years in all, had consisted in its issue of notes, which had varied from about £23,000 to £56,000. The Bank of Dundee was amalgamated with the Royal Bank of Scotland in 1864, when its deposits amounted in round figures to £900,000 and its note circulation to £41,000. After 1792, the money deposited with the banks in Scotland rapidly increased, but the habit of hoarding savings in a chest up to amounts of £10 or £20 continued to a much later period (History of the Dundee Banking Co.).

Private banking never appears to have had any considerable hold in Scotland. In 1819 eight private banks were in existence. These had all disappeared by 1844. In 1806 there were only ten banks of issue in Scotland, which practically carried on the whole business of the country. There were two other small banks established comparatively recently. These ten banks had, in 1806, 1180 branches.

The history of the growth and expansion of Scottish banking since 1826 is, as far as can be traced, as follows:

<table>

Against every note issued in excess of the limit allowed by the acts of 1844-1845, gold has to be held at the offices of the issuing banks in Scotland and Ireland. The amount of the specie to be thus held was, as explained by Sir Robert Peel in his speech of the 25th of April 1845, to be ascertained by the average amount of the note-issue in the respective banks. The object of the holding of this amount of specie by the bank which issued the notes was designed by Sir Robert Peel to cause the circulating medium of the country, being partly of notes and partly of specie, to fluctuate in the same manner as it had been in a metallic circulation only. The specie held in Scotland and Ireland against the note-issue is not a special security for the note circulation, but is placed in the banks there for this purpose. The influence ascribed to the working of the note circulation in the earlier part of the 19th century accounts for this legislation, which, as Sir Robert Peel stated in the speech of the 6th of May 1845, was intended to "ensure the uniform equivalency of bank notes to coin." It is not applicable to the present position of the circulating medium of the United Kingdom, which now consists mainly of a circulation of cheques. This differs absolutely from what was contemplated by Sir Robert Peel; no attempt is or can be made to cause such a paper circulation to fluctuate as if it were one of specie only. One result of the limitation of the power of note-issue to the banks in Scotland which possessed that power in 1845 has been that no important bank has been established in that country since. Notes are so largely employed in ordinary business in Scotland that a bank which does not possess the power, practically cannot carry on the business of banking. The object of the act of 1845 as far as this question is concerned has been a good though not a complete success.

This limitation in the number of the banks has, however, not been accompanied by any deficiency in the supply of banking accommodation to the people. There is a larger number of banking offices in proportion to the population in Scotland than in England and Wales or Ireland.

The large number of branches must, however, be a cause of great expense, and in several other respects it is obvious that a business can only be conducted properly and profitably by those banks which deal with more active centres of commerce. Although the profit derived from their large issue of notes may be thought to be considerable, yet, when we consider the many expenses incurred in conducting a large note circulation, the cost of printing, stamp duty, and the charges on importing gold from London when the circulation exceeds the limit fixed by the act of 1845, no small deductions must be made from the apparent profit to be derived from this head, if there is any direct profit at all.

On the other hand, the great number of branches possessed by the Scottish banks tends beyond doubt to their stability and prosperity. The network of banks on the surface of Scotland is as important to the development of the prosperity of the country as the network of the railways. It has caused a great economy of capital, as the universal practice of people, even of the most moderate means, is to lodge their money in banks.
BANKS AND BANKING

by the ready acceptance of their notes brought customers to their counters, and thus the existing system, fortunate in excellent managers, was built up gradually and surely.

Alone in the three kingdoms, Ireland maintains the same limit of authorized circulation as that established by Peel's Act of 1845. Not one of the six banks which had the privilege of issue at that period has lost it since.

The names of the banks carrying on business in Ireland, the years when they were established and their position in 1906, are as follows:

* Thus marked are not banks of issue.

Banking, like every other business, has to pass through periods of difficulty. The severity of these in the case of banking is intensified by the vast number of interests affected. These, on the one hand, are world-wide in their scope, on the other they touch every home in the country.

The stringency of such a time in England has since the passing of the act of 1844 been greatly enhanced by a doubt being sometimes felt as to whether a relaxation of the act of 1844 would be allowed. In any case, some little time must elapse before the assent of the ministers of the crown to the request of the Bank of England can be known. Since 1844 there have been five periods of pressure,—during 1847, 1857, 1866, 1870 and 1890. Of these in three, 1847, 1857 and 1866, the difficulties reached panic.

The crisis of 1847 was brought on by the speculation in railway enterprise which had gone on since 1845. So little had the anxieties of the autumn been anticipated that the bank rate of discount was 5 % on the 1st of January. It was raised to 6 % on the 14th and to 9 % on the 21st. It became 5 % on 8th April, 5½ % on 5th August, 6 % on 30th September and 8 % on 25th October. This was the highest. It was lowered to 7 % on 22nd November, on 2nd December to 6 % and on 23rd December to 5 %. An announcement was made on the 1st of October that no advances would be made on public securities. This was followed by general anxiety and alarm. The reserve of the bank was rapidly reduced to a very low ebb.

Meanwhile the anxiety and alarm prevailing were causing a general hoarding of coin and bank notes, and it really appeared not unlikely that the banking department of the Bank of England might be compelled to stop payment while there was more than £6,000,000 of specie in the issue department. The chancellor of the exchequer (Sir C. Wood, afterwards Lord Halifax) was urged by many deputations and remonstrances to relax the Bank Act, but he declined. At last, on the 22nd or 23rd of October, some of the leading city bankers had an interview with the prime minister (Lord John, afterwards Earl, Russell), and on their explaining the necessities of the position, the desired relaxation was given. The official letter (25th October) recommended "the directors of the Bank of England, in the present emergency, to enlarge the amount of their discounts and advances upon approved security." A high rate, 8 %, was to be charged to keep these operations within reasonable limits; a bill of indenunacy was promised if the arrangement led to a breach of the law. The extra profit derived was to be for the benefit of the public. The effect of the government letter in allaying the panic was complete.

The crisis of 1857 was the last occasion of an official inquiry. This is contained in the Report and Evidence of the Select Committee of the House of Commons on the Bank Acts (1857, 1858). The evidence given by Mr Sheffield Neave, the governor, and Mr Bonamy Dobree, deputy-governor of the bank in 1858, gives a vivid picture not only of what occurred, but of what might be expected to recur on such occasions. The wildest alarm prevailed, exchequer bills were scarcely saleable, and the bank itself sold £3,000,000 government securities at a considerable loss.

The extreme pressure was relaxed by the letter issued by the government on the 12th of November 1857, signed by Lord Palmerston, then premier, and Sir G. C. Lewis, which allowed a temporary relaxation of the Bank Act of 1844. The public alarm, however, was so great that it was not until the 21st of November that the severity of the pressure was in any way diminished. On the 20th of November the notes issued to the public on securities beyond the statutory limit (then £4,475,000) reached the sum of £5,280,000. By the next week the issue was almost down to the limit, and in the week following it was within the limit. On the 1st of January 1858 the bank rate was lowered to 8 % and the anxiety gradually passed away. Had the treasury been issued earlier, the pressure might not have been so severe, and the governor of the bank expressed a strong opinion that, if it had been later, it would not have been sufficient. November 1857 was the only occasion when the limits of the Bank Act as to issues were actually passed.

During the crisis of May 1866 £4,000,000 left the bank on one day in notes and coin, and the reserve of the bank was reduced in the return of the 1st of June of that year to £415,000. The bank rate was raised to 10 % and permission was given by the government to suspend the act. This, however, was not done. Tradition says that the bank asked the bankers, during the period of heaviest pressure of that terrible crisis—pressure more severe than anything that had taken place before or that has occurred since, to pay in every night the notes they had drawn out in the morning which were still in their tills at the close of the day, and that hence the legal limit was never exceeded. But it was not till the 6th of August that the rate was reduced to 8 %.

The effect of the crisis of October 1890 was far less severe. This was due to the judgment and skill displayed by the governor (Mr Liidderdale) and the directors of the bank, who imported £3,000,000 in gold from Paris. The reserve in that year never dropped below £10,000,000, and before the end of November the anxiety had greatly passed away. "Caution prevailed, but not panic, and the distinction is a very clear one." (See arts. on "Crises," Dictionary of Political Economy, vol. i.)

The most important requirement of banking in the United Kingdom is still the establishment of an efficient specie reserve. The reserve in the banking department of the Bank of England averaged:—

<table>
<thead>
<tr>
<th>Year</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1845</td>
<td>£8,500,000</td>
</tr>
<tr>
<td>1857</td>
<td>£11,000,000</td>
</tr>
<tr>
<td>1865</td>
<td>£15,000,000</td>
</tr>
<tr>
<td>1875</td>
<td>£20,000,000</td>
</tr>
<tr>
<td>1885</td>
<td>£25,000,000</td>
</tr>
</tbody>
</table>

This provides but a narrow basis for the whole business requirements of the country. Though much larger than in several previous years, it cannot be regarded as adequate. The figures fluctuate more severely than these decimal averages show, and the progress has not been one of uniform increase. Thus the £15,100,000 in 1885 was followed by £12,700,000 in 1888. The £29,900,000 of 1895 was followed by £34,000,000 in 1896 and £21,200,000 in 1899.

Beyond, or side by side with, the reserve of the Bank of England there are the reserves held by the other banks. Part of these are held in the form of balances at the Bank of England, part in specie and bank notes in their own tills. The latter, hence, are not unlikely to be estimated twice over. The published figures on this point are meagre.

The expectations expressed by Sir Robert Peel in his speech
on the bank charter and the currency of the 6th of May 1844 have not yet been fulfilled. "I rejoice," he said, "on public grounds, in the hope that the wisdom of parliament will at length devise measures which shall inspire just confidence, and secure a medium of exchange, shall put an end to the check on improvident speculations, and shall untie the just reward of industry and the legitimate profit of commercial enterprise conducted with integrity and controlled by provident calculation."

The extreme measures which have been required since the act of 1844 point out for themselves the necessity for reform. Three times since the date of the Bank Act of 1844 it has been needful to give permission for the suspension of that act which forms the very foundation of the monetary system of Great Britain. This, whenever it has occurred, has exercised a very injurious effect on credit abroad, as well as on prosperity at home.

The British money-market, the clearing-house of the world, is, in consequence of the smallness of its reserve, exposed to greater fluctuations than that of any other country. These fluctuations may arise from the need of meeting the requirements of other countries for specie or those arising from domestic trade. The recorded excess of imports over exports, £147,000,000 in 1906, though the difference is eventually balanced by the invisible "exports," gives foreign nations at times a pressure over the British money-market greater than has been previously been the case. The British banks have a tendency to flow outwards; this is financed by the great increase in the number of foreign banks which have branches in England. The need of providing sufficient reserves to meet requirements thus occasioned is obvious.

As regards the banks in which British interests are concerned in British colonies and countries we can only speak briefly. It must not be overlooked that in the Dominion of Canada there are 29 banks, many of them large, managed with much on the Scottish principle with capitals of nearly £18,000,000, and deposits of nearly £1,000,000. The number of offices is nearly 1000. There are, including the three Presidency banks, about 15 banks doing business mainly in India—in some cases connecting neighbouring countries and places like Bangkok, Hong-Kong and Zanzibar. These banks have capitals of more than £5,000,000 and deposits of fully £36,000,000 and over 210 offices. There are at least 8 banks in South-West Africa with capitals of nearly £5,000,000, deposits of nearly £50,000,000 and nearly 570 offices. There are 5 banks, including the Colonial Bank, in other British territories with capitals of about £1,000,000 and deposits of £1,000,000 and over 250 offices.

These are only very general approximations. The number of persons directly connected with the business, the number of branches, the number of offices, the number of deposits, the amount of capital, the amount of deposits, etc., vary very considerably. In the colonies with capitals amounting to £48,000,000, deposits £36,000,000 and offices 350. Outside British territories there are about 10 large joint-stock banks in Central America, with nearly £1,000,000 of capital, 1,000,000 deposits and about 60 offices. There are 6 large banks doing business principally in the East with more than £15,000,000 of capital, £66,000,000 of deposits and 100 offices; and 5 others, including Barclays, with about 50 banks doing £22,000,000 deposits. There are about 20 British banks doing business in foreign countries with capitals amounting to £15,200,000, deposits £135,000,000 and offices 173.

In this statement we have included only the more important banks which collectively wield about £1,000,000 capital and more than £495,000,000 of resources operating at about 3700 offices situated in places as different from each other and as widely separated as California and Hong-Kong, Constantinople and New Zealand.

France.—In France the first bank of issue, originally called the Banque Générale, was established in 1716 by John Law, the author of the Mississippi Scheme and the Système. Law's bank, which had been converted into the Banque Royale in 1718, and its notes guaranteed by the king (Louis XV.), came to an end in 1721; an attempt at reconstruction was made in 1767, but the bank thus reformed was suppressed in 1793. Other banks, some having notes, then carried on operations with limited success, but these never attained any real power. There were many negotiations on the subject of the establishment of a bank in 1796. The financial difficulties of the times prevented any immediate result, but the advice of those engaged in this plan was of great assistance to Napoleon I., who, aided by his minister Mollien, founded in 1800 the Bank of France, which has remained from that time to the present by far the most powerful financial institution in the country. The objects for which it was established were to support the trade and industry of France and to supply the use of loanable capital at a moderate charge. These functions it has exercised ever since with great vigour and great judgment, extending itself through its branches and towns attached to branches over the whole country. At its establishment and for some time subsequently the operations of the bank did not extend over the whole of France. Departmental banks with the privilege of issue had been formed under a law adopted in 1803. At the close of 1847 there were nine of these banks existing in as many of the larger towns. In 1848, however, they were absorbed into the Bank of France, which has since possessed an exclusive privilege of issue, and in 1863 took over the Bank of Savoy after that province was united to France.

The Bank of France has successfully suaited many political as well as financial troubles both during and since the times of Napoleon I. Thus during the war with Germany in 1870, the many difficulties that followed when the Commune reigned in Paris in 1871, the payment of the war indemnity—not completed till 1873—were all happily overcome. Great pains, too, have been taken, especially of recent years, to render the banks more accessible to the farmer and to agricultural industry. In 1877 the offices of the Bank of France were 78 in number; in 1906 they were 447, including the towns "connected with the branches—an arrangement which, without putting upon the branches the full burden of the operation of the business, has connected many of the advantages which a branch confers. The quantity of commercial paper discounted is very large. More than 20,000,000 bills were discounted in 1906, the total amount being £156,234,946. The advances on national and municipal securities amounted to £1,066,280,124. The rate of discount in Paris is as a rule lower and the number of alterations fewer than in London. From May 1900 to January 1906 there was no change, the rate remaining uniform at 7 1/2%. At this rate,£10,000,000 bills are discounted, including those below 8s.; about £1,500,000 of this class were discounted in 1906. Since the 27th of March 1890 loans as small as £10 are granted. In most cases three "names" must be given in Paris for larger loans, or for transactions or security given, but those necessary safeguards have not to be furnished in such a manner as to hamper applicants for loans unduly. In this manner the Bank of France is of great service to the industry of the country. It has never succeeded to far, however, in attracting deposits on any line, like the scale of the Bank of England or the banks of the English-speaking peoples, but it held, as stated in the balance-sheet for the 3rd of December 1906, about £25,000,000 in deposits, of which £14,000,000 were on account of the treasury and £21,000,000 for individuals, and the amount held in this manner gradually increases. The report for 1904 says "each year the movement in increases, and this economical and safe mode of effecting receipts and payments is more and more appreciated by the public." In one respect, however, its strength is indeed a disadvantage in competition with this branch of its business. The average amount held in this manner for individuals during 1906 was about £23,000,000. As the accounts numbered 77,159 the average for each account was considerably small. Accounts so small give a great probability of permanence. The figures of the accounts for 1904 were as follows:—

<table>
<thead>
<tr>
<th>Account Type</th>

At the present time the Bank of France operates chiefly through its enormous note circulation (averaging in 1906 £186,300,000), by means of which transactions in France are carried on.

The limits of the circulation of the Bank of France and the dates when it has been extended are as follows:—

Converting the Franc as 25 = £1.
Most business transactions in France are liquidated, not in cheques as in England, but in notes of the Bank of France. These, owing to their convenience, are preferred to specie. This is accumulated in the vaults of the Bank of France, which in 1906 held on average £115,000,000 gold and £42,000,000 silver. The gold and specie, as the Bank of France is generally considerably larger in amount than that held by the Bank of England, which in the autumn of 1890 had to borrow £5,000,000 in gold from the Bank of France at the time of its financial crisis. The large reserve of gold and specie has given stability to the trade of France, and has enabled the bank to manage its business without the numerous fluctuations in the rate of discount which are constantly occurring in England. It is true the banks are holding a very large amount of specie imposes a very heavy burden on the shoulders of the shareholders of the bank, but they do not complain. The advantage to the business from the low rate of interest which has to be paid for the use of borrowed capital in France is a great advantage to the trade and industry of that country.

The mass of the reserve in France is so great that the movements of the precious metals, when they are the result only of natural causes, are allowed to go on without corresponding movements in the discount rate. But it must be remembered that this large reserve is held in part against a gigantic note issue, and also that the trade activity and enterprise of the French people are less intense than in other countries, and consideration of the large amount of specie imposes a very heavy burden on the shoulders of the shareholders of the bank, but they do not complain. The advantage to the business from the low rate of interest which has to be paid for the use of borrowed capital in France is a great advantage to the trade and industry of that country.

The Reichsbank, by far the most powerful banking institution in Germany, is managed by the bank directors appointed by the chancellor of the empire. The shareholders join in the management through a committee, of which each member must be qualified by holding not less than three shares. The government exercises complete powers of control through the chancellor of the empire. The influence of the Imperial Bank now permeates, by means of its branches, all the separate kingdoms of the empire—Saxony, Hanover, Royal Prussia, Hamburg, and the Free City of Berlin. The Imperial Bank's doing business throughout the empire is rendered possible through the banking associations of the member states, which have been formed and are under the control of the government. The Imperial Bank's doing business in the member states is carried on through the associations which are the result of the union of the banks of the member states. The Imperial Bank has its head office in Berlin, and is governed by a board of directors, consisting of the president of the Reichsbank, Dr. Kock, and three other directors, appointed by the government. The board of directors is responsible to the government, and its decisions are subject to the approval of the government. The chairman of the board of directors is the president of the Reichsbank, Dr. Kock. The board of directors is responsible to the government, and its decisions are subject to the approval of the government.

There are also many private banking firms in Germany which do a considerable amount of business. The Imperial Bank of Germany, the "Reichsbank," has about 135 banks doing business in the states which form the German empire. These credit and industrial banks, with their large resources, have had an immense influence in bringing about the astonishing industrial development. Five banks possess the right of uncovered note-issue; these are:

1. The Imperial Bank of Germany with right of issue £23,641,450
2. The Bank of Saxony
3. The Bank of Bavaria
4. The Bank of Württemberg
5. The Bank of Baden

At the Bank of Germany the coin and bullion held is sometimes larger than at the Bank of England. The statement of the specie in the weekly accounts includes silver. The amounts held in gold and silver are shown in the balance-sheet, which is published. The figures of the balance-sheet for the 31st of December 1906 showed in round numbers £24,000,000 gold and £9,000,000 silver. As far as the capital is concerned the £18,000,000 of the Bank of Germany is made up of £9,000,000 of specie and £9,000,000 of the Bank of France and the £12,000,000 of the Bank of Germany. The note circulation of both the other banks is considerably larger than that of the Bank of England, that of the Bank of England being £12,000,000, and of the Imperial Bank of Germany £9,000,000, in 1906.

The capitals and reserves of the German banks, including those of banks established to do business in other countries, as South America and the Far East, and of the Bank of Germany, are about £133,000,000, with further resources, including deposits, notes and mortgage bonds, amounting to fully £141,000,000. The amount of the capital compares very closely with that of the capitals of the banks of the United Kingdom. The deposits are increasing. The deposits, however, are not the whole of the resources of the German banks. In addition to deposits, the banks use, besides, of their accepted deposits, in a manner which is not practised by the banks of other countries, and the average note circulation of the Reichsbank, included in the statement given above, is between £60,000,000 and £70,000,000. The Reichsbank is increasing proportion of the reserves of the German banks is employed in industrial concerns, some of which are beyond the boundaries of the empire. The dangers of this practice have called forth many criticisms in Germany, among which may be considered the requirement of the Reichsbank that members of the Reichsbank, by a resolation of the board of directors, and of the president of the Reichsbank. Dr. Kock especially points out the need of the development of powerful banks in Germany unconnected with speculative business of this kind. The object of employing these reserves is to avoid the higher rate of interest obtained from these investments than could be availed of by resorting to cheap rates of interest at home. But such an employment of the resources of a bank is opposed to all regular rules of business and of banking tradition, which abounds from making fixed investments of any large part of the resources of a bank. Dr. Kock believes that the risks of the one "reserve system" mentioned by Bagehot are not to be feared in Germany.

The recent movement in favour of concentration among the banks has been described by Dr. Depire and Dr. Riesser, who give particulars of the business done by these banks, which do not correspond with banking as practised in the United Kingdom, being more of an industrial character.

There are also many private banking firms in Germany which do a considerable amount of business. The Imperial Bank of Germany, the "Reichsbank," has about 135 banks doing business in the states which form the German empire. These credit and industrial banks, with their large resources, have had an immense influence in bringing about the astonishing industrial development.

Before the Reichsbank was established, Hamburg was the first, and for a long time the only, example of a clearing bank in Germany. This was taken up by the Reichsbank when it established its office in Hamburg in the time-honoured building which had belonged to the Hamburg Clearing House. Similar business had long been undertaken by the Bank of London and the Bank of England, which were the forerunners of the Reichsbank. The clearances, or clearing banks, were the results of a movement which originated in Germany, and which was developed by the Reichsbank in 1876. Through the "clearing system" money can be remitted from any of the 433 places in which there is an office of the Reichsbank, to any of these places, without charge either to the sender or the receiver. It is sufficient that the person to whom the money is to be remitted should have an account at the bank. Any person owing money in the remotest parts of the empire may go to the office of the bank which is most convenient to him and remit the money via the clearing house, which is placed at his disposal in the clearing house. The funds are transferred by the clearing house to the bank from which the money was sent, the same day following day at the office of the bank, without charge, to the account of the creditor wherever he may reside. The person who makes the payment need not have any account with the bank. The impetus to business in Germany has been considerable, and the system has become very popular. In the case of international transactions, it practically amounts to a money-order system without charge or risk of loss in transmission. From Hamburg and Bremen to the frontiers of Russia, from the shores of the Baltic to the frontiers of Switzerland, the whole empire of Germany has thus become a single monetary system for monetary purposes one country only. The amount of these transfers for the year 1906 exceeded £1,380,000,000.

The note circulation is also a powerful factor in the business of the banks of Germany. The Reichsbank, by the law of 1873, and the commercial banks by the law of 1889, corresponding in some degree to Peel's act of 1844, which regulates the note circulation of the Bank of England. An unlimited cover, originally £2,500,000, increased to £14,511,450 in 1906, was given to the Reichsbank by the law of 1889, and this was extended by these and by the act of the 5th of June 1902 to £23,641,450. Against the notes thus issued which are not represented by specie, treasury notes (Reichskassenscheine, the legal tender notes of the
The Reichsbank is bound by law to redeem its notes at the rate of £9,000,000, and the loans and advances to £14,200,000. The notes issued averaged for the year £9,000,000. The gold held amounted, 30th December 1886, to £24,000,000. If the condition of the Reichsbank is to pass within the limits allowed by the law, the bank is permitted to do this on the payment of 5% on the surplus. In this respect the German act differs from the English act, which allows no such automatic statutory power of overpassing the limit of issue. We may well consider that this arrangement is an advantage for the German bank, and the fact that it has been made use of annually since 1895 appears to show that it is needed by the business requirements of the bank. On the other hand, it is true that the Reichsbank has been annual and large, having been £25,267,000 on the 29th of September 1896 and £28,652,000 on the 31st of December of the same year. The amount of the duty paid on the excess issue in the year 1895 was £18,784, and the duty paid on the £9,000,000 held amounted to £30,100. The increase of the uncovered limit (untaxed limit of issue called in Germany the “note reserve”) has not been sufficient to obviate the need for an excess of issue beyond the limit.

In accordance with a law passed in 1906 the Imperial Bank Act imposes a limitation of the number of notes and bills issued by the bank. The old regulation was raised by the bill of that year to £9,000,000. The reserve fund has been raised out of surplus profits to £3,240,000. This exceeds the amount required by the act of 1895, which was £3,000,000. The amount of the reserve fund diminished the dividend receivable by the stockholders of the Reichsbank and increases the share which the government will obtain.

The arrangement with the four note-issuing banks is designed to enable the central bank to control the money market actively in Germany. The Reichsbank has to raise its bank-rate in order to protect its gold reserves. The official published rate of discount of the Reichsbank is to be binding on the private note-issuing banks after it has reached or when it reaches a certain percentage above the official discount rate, which, in case the Reichsbank itself discounts at a lower rate than the official rate, at more than 1% below that rate. If the Reichsbank discounts below the official rate, it is to announce that fact in its daily report.

The subject being important, we quote from the amend the sections governing the discount rate:—Gesetze betreffend die Abänderung des Bankgesetzes vom 14. März 1875; vom 7. Juni 1889, Art. 7, S. 2. The private note-issuing banks, “the grain, wheat, which will give up their right of issuing notes. The object of the enactment is apparently to protect the specie reserve of the Reichsbank, but it may be doubted whether, considering the importance of the other three banks, the Reichsbank would be able to do this except in similar conditions—relatively to the note-issuing banks, the restrictions put on the note-issuing banks will have any practical effect.

Since 1870 banking has made immense progress in Germany, but it may be some time before the habit of making payments by cheque instead of in cash is entirely displaced. The word, however, may be taken as a prophecy that the day is not far off when the Reichsbank will be the bank of issue merely for note-issuing banks.

The bank did much, during the first eight years after its organization, to restore order to the chaos of Federation finances. It loaned to Morris, as government superintendent of finance, $1,249,975, of which $906,581 was repaid in cash and the remainder by surrendering the stock in the bank owned by the government.

The Bank of the United States.—A national bank of issue was one of the essential parts of the system built up by Alexander Hamilton in organizing the finances of the Federal government under the constitution of 1789. The first "Bank of the United States" was accordingly incorporated in 1791, with a capital of $10,000,000, divided into 25,000 shares of $400 each. This bank issued circulating notes, discounted commercial paper and aided the government in its financial operations. The government subscribed one-fifth of the capital, but paid for it by a roundabout process which actually resulted in the loan of the amount by the bank to the treasury. Other loans were made by the bank to the government, which gradually carried the obligation by the end of 1795 to $6,200,000. In order to meet these obligations, the government gradually disposed of its bank stock, until by 1802 its entire holdings had been disposed of at a profit of $711,850. The bank did not publish reports, but a statement submitted by Gallatin to congress for January 24, 1811, showed resources of $24,183,046, of which $3,578,294 was in loans and discounts, $2,750,000 in United States stock and $5,000,567 in specie.

The expiration of the charter of the bank in 1811 was the occasion of a party contest, which prevented renewal and added greatly to the financial difficulties of the government in the war with Great Britain which began in the next year. Although foreign shareholders were not permitted to vote by proxy, and the twenty-five directors were required to be citizens of the United States, the bank was attacked on the ground of foreign ownership as well as on the constitutional ground that congress had no power to create such an institution.

The government was compelled in the war of 1812 to rely on the state banks. Their suspension of specie payments, in 1814, made it very difficult for the treasury to transfer funds from one part of the Union to the other, because the notes of one section did not circulate readily in another. Gallatin left on record the opinion that the suspension of specie payments "might have been prevented at the time when it took place, had the former Bank of the United States been still in existence."

The financial condition of the government became so bad during the war that the second Bank of the United States was authorized in April 1816. The general project was that of Alexander J. Dallas, who in October 1814 had become secretary of the treasury. The capital of the new bank was $35,000,000, and the government again appeared as owner one-fifth of the stock, which was paid in a stock note. The president of the United States was authorized to appoint five of the twenty-five directors and public funds were to be deposited in the bank, "unless the secretary of the treasury shall at any time otherwise order and direct." The right of congress to charter the bank came before the Supreme Court in 1819 in the famous case of McCulloch v. Maryland. Chief Justice Marshall rendered the decision that the right to create the bank was within the implied powers granted by the Federal constitution, and that it was not competent for the states to levy taxes upon the circulating notes of the bank or upon its property except in common with other property.

The second Bank of the United States was not well managed in the early part of its career, but was upon a firmer foundation under the presidency of Langdon Cheves in 1819. Its policy greatly benefited commerce, but invited bitter complaints from the private dealers in exchange, who had been enabled to make excessive profits while the currency was below par, because of its different values in different states and the constant fluctuations in these values. The Bank, in the language of the report of Senator Samuel Smith of Maryland in 1823, furnished "a currency as safe as silver, more convenient, and more valuable

The early history of the American colonies is strewn, like that of most new countries, with many crude experiments in banking and currency issues. Most of these colonial enterprises, however, were projects for the issue of paper money rather than the creation of commercial banks. Speculative banking was checked to a large extent in the colonies by the Bubble Act (6 Geo. I. c. 18), which was passed in England after the bursting of the South Sea Bubble. This act, which forbade the formation of banking companies without a special charter, was in 1740 extended to the colonies.

The serious history of banking in the United States may be said to have begun with the foundation of the Bank of Pennsylvania. This bank originated in the project of a number of the citizens of Philadelphia to supply the continental army with rations. The first bills, issued in 1780, were nothing more than interest-bearing notes payable at a future time. The advances in continental money made by the shareholders were secured by bills of exchange for £150,000, drawn on the American envoys in Europe, but not intended to be negotiated.

A further outgrowth of the needs of the continental government was the Bank of North America, which was authorized by congress on May 26, 1781. The act gave to Robert Morris, the financier, power to create a bank with a capital of $400,000, to be increased if desirable. Morris arranged with the Bank of Pennsylvania to take over its holdings of foreign bills and paid in cash its claims against the Federation. The Bank of North America did not begin business until the 7th of January 1782, and there was so much doubt of the power of the continental congress to charter a bank that it was thought advisable to obtain a charter from the state of Pennsylvania. Under this charter the bank continued to operate until it was absorbed in the national banking system in 1863, and it may be considered the oldest organized banking institution in the United States.
BANKS AND BANKING

[AMERICAN]

than silver, which through the whole western and southern and interior parts of the Union, is eagerly sought in exchange for silver; whereas in these sections, often bears a premium paid in silver, which is, throughout the Union, equal to silver, in payment to the government, and payments to individuals in business."

The bank in 1835 had attained a circulation of $23,975,422 loans of $59,322,445; and deposits of $5,061,436. The institution was ultimately destroyed by the open enmity of President Jackson, who in 1833 had suspended the deposit of public money in its custody. This policy known as the "removal of the deposits," excited a bitter political controversy in which Clay and Webster led the opposition, but Jackson was supported by the public (see Jackson, Andrew). The Federal charter of the bank expired in 1836. Under a charter obtained by President Nicholas Biddle from the state of Pennsylvania, the bank continued its business, but without success, and in 1841 it went into liquidation.

The State Banks.—The Bank of the United States found powerful rivals during its life and successors after its death in the banks chartered by the separate states. In the undeveloped state of the country in the early days there was much unsound and speculative banking. The most successful systems were those of New York and New England, where the surplus capital of the country in the early days was chiefly concentrated. The least successful banking systems were those in the newer and poorer regions of the country, and they grew progressively worse as poverty and inexperience added to the difficulty of setting aside capital for investment in the tools of exchange.

The termination of the life charter of the Bank of the United States was followed by a banking mania. In Pennsylvania a bill authorizing 41 new banks was passed over the veto of the governor, and 37 of them were in operation in 1814. Similar movements in other states increased the number of banks in four years (1814-1818) from 88 to 208. The amount of specie was not adequate to support the mass of credit which these banks created, and what there was in the country drifted to New England, which was upon a metallic basis. A number of banks collapsed in 1814, and business proscription was prolonged for several years.

The banking laws of the states varied considerably. Some states authorized the issue of notes upon state bonds, many of which, especially at the outbreak of the Civil War, proved valuable. In New England, however, a system prevailed which required the prompt redemption of the banks' notes at par. The New England Bank was the pioneer of this movement in 1814. In 1824 what was known as the "Suffolk system" of redemption came into operation. This system provided for the deposit by a bank in the Suffolk Bank in Boston of a redemption fund, from which the notes were redeemed and afterwards sent home by the Suffolk Bank for collection. This system, with slight modifications, continued in successful operation until 1838. The circulation of the New England banks in 1838 was less than $40,000,000 and the redemptions in the course of the year through the Suffolk Bank were $400,000,000. It was the essential merit claimed for the system that it tended to keep the volume of the circulation constantly adjusted to the requirements of business. A branch redemption agency was established at Providence. Legal sanction was given to the system in Vermont by an act of 1842, which levied a tax of 1% upon bank capital, but remitted this tax to any bank which would "keep a sufficient deposit of funds in the city of Boston, and should at that city uniformly cause its bills to be redeemed at par."

The period from 1836 to 1842 was a trying one for American banking. It was preceded by another great expansion in financial ventures, made without sufficient circulating capital or adherence to conservative banking methods. Foreign capital had come into the country in considerable amounts after the English crisis of 1825, the entire debt of the general government was paid off and a tremendous speculation occurred in public lands, which were expected to advance rapidly in value as the result of immigration and the growth of the country. The sales of public lands in 1836, on the eve of the crisis, reached 20,074,870 acres and brought receipts to the treasury of $25,167,833. How essentially speculative was the mass of these sales is indicated by the fact that such receipts declined in 1842 to only $417,972. President Jackson pricked the bubble of speculation by the "Baltimore crisis" of July 11, 1836, requiring payments for public lands to be made only in specie or notes of specie value. Practically every bank in the Union stopped payment, and banking capital fell from $38,442,602 in 1835 to $196,804,300 in 1846. As usual in periods of business collapse the shrinkage of capital did not follow at once the outbreak of the panic, but was the result of gradual liquidation. Specie payments were resumed in 1838, but there was another crash in 1842, after the United States Bank finally suspended.

In New York, which was becoming the chief commercial state of the Union, the banks of New York City were generally sound, but several different systems were tried of securing the circulating notes. The "safety-fund system," inaugurated in 1829, provided for a contribution by each bank towards a fund to meet the deficit of any contributing bank which might fail with assets insufficient to meet its liabilities. It was the intention of the act to protect by this fund only the bank-notes, but it was treated as a fund for the payment of all the liabilities of a failed bank and in consequence the fund was exhausted by important failures which occurred in the panics of 1837 and 1857. Before 1843 the issue of notes was not controlled by the state, so that in several cases there were illegal over-issues.

This was called the "free-banking system" was inaugurated in New York by the act of 1836. This system permitted any body of persons, complying with the requirements of the law, to form a bank and issue circulation secured by the deposit of various classes of public bonds. This system was in operation at the outbreak of the Civil War, was imitated in several other states, and became in a measure the model of the national banking system. The state banks of Indiana and Ohio were among the most successful of the state banks, being modeled somewhat on the European plan of a central bank. They held in their states an exclusive charter for issuing notes and had branches at important points throughout the state. Under the management of Hugh McCulloch, afterwards secretary of the treasury, the bank of Indiana weathered the crisis of 1857 without suspending specie payments, and retired its circulation when gold went to a premium in 1862.

One of the defects of the state system of note-issues was the inconvenience which it occasioned. Notes issued outside a state could not safely be received without careful scrutiny as to the responsibility of their issuers. The systems prevailing in New England, in Louisiana, in Ohio and in Indiana were eminently successful, and proved the soundness of the issue of bank-notes upon the assets of a well-constructed commercial bank. But the speculation fostered by loose banking laws in some other states, and the need for uniformity, cast a certain degree of discredit upon the state banks, and prepared the way for the acceptance of a uniform banking system in 1863.

The power of note-issue formed a more important part of banking resources before the Civil War than in later years, because the deposit system had not attained its full development. Thus in 1835 circulation and capital of state banks combined were about $335,000,000 and deposits were only $35,000,000, in 1807 circulation and capital of national banks $1,430,000,000, while deposits were $4,322,000,000— in the earlier period deposits forming less than one-third of the other two items and in the later period three times the other items. The circulation of the state banks fluctuated widely at different periods. A maximum of $149,185,800 was attained in 1837, to decline to $106,468,672 three years later and to a minimum of $58,563,068 in 1843. From this point there was a tendency upward, with some variations, which put the circulation in 1845 at $80,618,711; 1848, $125,566,091; 1850, $131,566,526; 1854, $240,880,207; 1856, $195,477,950; 1858, $155,280,344; 1860, $207,102,477; 1864, $238,677,118.

Other leading items of the accounts of the state banks for representative years are as follows:
The National Banking System.—The creation of the national banking system was mainly the outcome of the financial necessities of the Federal government in the Civil War. It was found difficult to float government bonds at profitable rates, and Mr. Chase, the secretary of the treasury, devised the scheme of creating a compulsory market for the bonds by offering special privileges to banks organized under Federal charters, which would issue circulating notes only when secured by the deposit of government bonds. But this plan, authorized by the act of 25th February 1863 (supplemented by the act of 3rd June 1864), was not sufficient to give predominance to the national banks. The state banking systems in the older states were so firmly entrenched in the confidence of the commercial community that it became necessary to provide for legalizing about 10 per cent of the face value of the notes of state banks in circulation after the 1st of July 1866. The state banks were thus driven out of the note-issuing business, some being converted into national banks, while others continued their commercial business under state laws without the privilege of note-issue. A remarkable growth in the national banking system took place; in 1864 there were 453 national banks with an aggregate capital of $79,366,950, and in 1865 there were 1014 banks with an aggregate capital of $242,542,082.

The national banking system was specially marked by the issue of circulating notes upon United States bonds. Any national bank desiring to issue notes might by law deposit with the United States treasurer bonds of the United States to an amount not exceeding its capital stock, and upon such bonds it might receive circulation equal to 90 per cent of their par-value. No bank could be established which did not invest one-third of its capital in bonds. This was changed in 1874 so as to reduce the requirement to 25 per cent, with a maximum mandatory requirement of $3,000. Any notes were taxed at the rate of 10 per cent per annum. The notes were determined from the provision for circulation of the lowest of what was described by critics as "double interest," being credited with the interest on bonds in the custody of the treasury department, and being also able to lend their notes to the public. But some deductions had to be made: notes could not be issued to the full par-value of the bonds; the tax of 10 per cent upon circulation reduced by that amount the profit which would otherwise be earned; and the banks had to set aside in gold or other lawful money what was needed for redemption purposes and for reserves. As the banks suspended specie payments at the close of 1861 and great masses of government paper-money were issued, gold ceased to be a medium of exchange except in California, and the new banks redeemed their notes in government paper. The gold-value of the bank-notes, therefore, rose and fell with that of government notes until the resumption of payments in specie by the national treasury on the 1st of January 1879.

The amount of bank-notes in circulation proved in practice to be increased largely by the price of bonds. The maximum originally set for bank circulation was $300,000,000. This was increased in 1870 by $43,000,000, and in 1873 by $50,000,000. The circulation reached $362,651,169 on the 1st of January 1873, but afterwards declined materially as bonds became scarce and the price rose. The fact that circulation could be issued to only 90 per cent of the par-value of the bonds greatly reduced the net profits on circulation when the price of 4 per cent bonds rose in 1889 above 120 and other classes of bonds rose in like ratio. The circulation of bank-notes fell as low as $167,927,574 on the 1st of July 1891, but afterwards increased somewhat as the supply of bonds was increased to meet the treasury deficiencies of 1894-1896 and the expenses of the war with Spain.

The national banks supported the government cordially in the measures taken to bring about resumption of gold payments on the 1st of January 1879 under the law of 1875. The banks held more than $125,000,000 in legal tender notes, of which sum nearly one-third was held in New York City. A run upon the treasury for the redemption of these notes would have exhausted the gold funds laboriously accumulated by secretary Sherman and compelled a new suspension. But the banks appointed a committee to co-operate with the treasury, declined to receive gold longer as a special deposit, and resolved to receive and pay balances without discrimination between gold and government notes. Thus resumption was accomplished without jar, and as early as the 17th of December 1878 gold sold at par in paper.

The silver legislation enacted by Congress in 1878 and 1880 caused uneasiness in banking circles, and the banks discriminated against silver dollars and silver certificates in their cash. When the treasury began to lose gold heavily, however, in 1893, a combination of leading bankers in New York, Boston, Philadelphia, Baltimore and Chicago turned over a large part of their holdings to replenish the government reserves. About 150 national banks suspended during the panic of 1893, but 84 of these afterwards resumed deposits and a large number of deposits, it is true, the system suffered the greatest decline during the years of liquidation following the actual panic, the number of banks falling from 3856 on the 1st of June 1893 to 3585 on the 1st of June 1899, and aggregate capital falling during the same period from $608,454,665 to $610,028,805.

A new extension was given to the national banking system by the provisions of the gold standard law of 14th March 1900. Banks were authorized to issue circulation to the full par-value of bonds deposited, and the tax upon circulation was reduced from 1 per cent to 1/2 of 1 per cent in the case of circulation which was secured by the 2 per cent refunding bonds, which were authorized by this law. By issuing 2 per cent bonds in exchange for those paying a higher interest, at approximately the market-price, it became possible to obtain a given amount of notes upon a smaller investment in bonds, independent of other provisions of the law. Under these provisions the volume of notes outstanding, secured by bonds, which stood on the 31st of October 1899 at $297,920,774, reached on the same date in 1900, $308,829,064; in 1901, $328,195,613; in 1902, $355,783,189; in 1903, $380,650,821; in 1904, $425,320,000; in 1905, $490,037,806; in 1906, $536,933,169; and in 1907 $592,727,614.

The lowest denomination of national bank-notes authorized by law is $5, and not more than one-third of any bank's issues can be of this denomination. The government issues notes for $1 and $2, as well as for higher denominations. The largest amount of bank-notes of one denomination is in bills for $10, which on the 31st of October 1907 constituted $249,046,530 in total outstanding issues of $869,655,461. Of this total circulation $562,727,614 was secured by bonds, and the remainder, $47,727,821, was covered by lawful money in the government treasury, deposited for the redemption and retirement of the notes as they might be received.

An important extension of the national system resulted from the authority given by the act of 1900 to incorporate national banks with a capital as low as $25,000, in places having a population not in excess of 3000. The previous minimum limit had been $50,000. Under this provision there were incorporated to the 31st of October 1907 2389 national banks with capitals of less than $50,000, with aggregate capital of $63,912,500, of which $17,960,500 in banks were conversions of state and private institutions, 752 were reorganizations and 165 were new institutions.

The national banks possess most of the powers of commercial banks, but are not permitted to hold real estate other than their banking houses, unless taken for debt. Five reports are required each year to the comptroller of the currency at dates selected by him without notice, and each bank is subject to the visitation of bank examiners acting under the comptroller. No reserves against notes are required by existing law except 5 per cent, which is
kept in Washington for current redemption purposes. The redemption system is defective in that redemptions are not authorized at other places, and the notes reach the treasury on an average only once in two years. For many years the banks are prohibited from retiring more than $1,000,000 of notes monthly, but the limit was raised by an act of 4th March 1907 to $1,000,000 per month.

Reserves are required against deposits to the amount of 25% in so-called "reserve cities," and 15% in what are called the "country banks" outside of reserve cities. Not all these amounts, however, are required to be kept in cash. The three central reserve cities, where cash is required, with only trifling deductions, are New York, Chicago and St Louis. In other reserve cities, which in 1908 numbered forty, the banks are permitted to deposit half their cash in national banks in central reserve cities, while country banks may deposit three-fifths of their cash in any reserve city. The shareholders of national banks are subject in case of liquidation to double liability upon their shares, and this is now the rule in most of the conservative state banking systems. National bank-notes are not legal tender, but are receivable by the government for all obligations except customs dues.

The panic of 1907 imposed a severe strain upon the cash resources of the banks of New York City, but did not cause any such considerable number of failures as occurred in 1893.

Payment of cheques in currency was suspended in New York on the 28th of October 1907, and continued until about the beginning of January 1908. The panic was precipitated by over-speculation by a group of national banks, followed by the suspension of the Knickerbocker Trust Company on the 22nd of October with deposits of $38,000,000. Then came runs on other companies, a deficit in the required reserves of New York banks of $8,838,835 in the week of 2nd November, and arrangements for the importation of foreign gold to an amount which soon approached $100,000,000. With an increase during the autumn of about $77,000,000 in national bank circulation, a transfer of $72,000,000 from the treasury to the banks, and a further decline in required reserves in New York during the next week, the amount of currency which was added to the circulation or disappeared during a few weeks of the panic amounted to more than $275,000,000, or nearly one-tenth of the usual volume of circulation in the country.

The total bank-note circulation on the 28th of December 1907 had risen to $487,340,835; but this amount was abnormal and was reduced somewhat during the spring of 1908.

The position of the trust companies, especially those of the city of New York, was one of the disturbing features of the panic. These companies were comparatively a small factor in New York finance at the time of the panic of 1893. The capitalization of all the trust companies in the United States, even as late as 1897, was only $106,968,253, and individual deposits were $868,927,205. The capital of these companies had risen to $177,145,982 in 1907 and their deposits to $2,061,623,927. The trust companies of New York were required by the law of the state to maintain only 5% of their demand deposits in cash in their vaults. Whilst most of them had also large amounts on deposit in national banks, these reserves proved inadequate to sustain the vast mass of credit which was built upon them. The absolute amount of the reserves, however, was perhaps less important than the class of business to which some of the less conservative of these companies had committed themselves. Instead of keeping their assets liquid by purchases of commercial paper and loans on first-class negotiable securities, they had in some cases engaged in speculative undertakings and had locked up their funds in enterprises requiring a long time for their consummation.

It was these combined influences which led to distrust of the Knickerbocker Trust Company, and to the runs upon that company and others during the late days of October and early November. The result was to reduce the total resources of the forty-eight trust companies of Greater New York from $1,205,010,700 on the 22nd of August 1907 to $38,000,000 on the 16th of December 1907. Individual deposits subject to cheque fell from $602,744,460 to $1,373,733. Such a reduction of resources within so short a time, most of it being accomplished within a few weeks, has hardly ever been recorded in the history of banking, and the railways, with a capitalization of $5,150,000,000 in 1906, were able to meet in their cash and meet such demands was evidence to a certain extent that the criticisms upon them were exaggerated. The necessity for stronger reserves and for greater safeguards against speculative operations was so strongly impressed upon the public mind, however, that several restrictive measures were enacted at the session of the New York legislature in 1908, designed to prevent any abuses of this sort in the future.

The function of issuing notes, which is exclusively a privilege of national banks, has diminished in importance in America, as other methods of transferring credit have attained a wide development. This has not only been true of the national banks themselves, but has accounted for the development alongside the national banking system of state banks, private banks and trust companies, which have not had the privilege of note-issue, but have obtained other privileges sometimes greater than those of the national banks.

The aggregate resources of all classes of banks in the United States has in recent years increased about $687,340,835; the following table gives the increase in the chief items of the accounts of national banks for representative years from the reports made nearest to the beginning of the year:

The aggregate banking power of the United States, as computed by the comptroller of the currency in his annual report for 1907, increased from $5,150,000,000 to $71,524,800,000 in 1907, and the banking power of foreign countries from $10,835,000,000 to $27,034,200,000, representing an increase for all reporting countries from $15,985,000,000 to $44,893,900,000.

The system of clearing cheques has attained a higher development in the United States than in any other country, except perhaps, Great Britain. Clearing-houses exist in about 112 leading cities, and the aggregate clearings for the year ending 30th September 1907 reached $1,354,663,285,250. The New York Clearing-House is greatly in excess of the proportion of this business; its clearings in 1906 were 67% of the total clearings in 55 of the larger cities. The volume of clearings fluctuates greatly with the volume of stock-exchange transactions and with the business prosperity of the country. An indication of these fluctuations at New York is afforded by the following table, taken from Conant’s Principles of Money and Banking, brought down to 1907.

The Clearing-House Committee of the New York Clearing-House exercises a powerful influence over the banking situation through its ability to refuse aid in emergencies to a bank which is unwisely conducted. This power was used in the panic of 1907 to eliminate several important, but speculative, financial interests from control of national banks. Only national and state banks and the sub-

Treasurer of the Treasury at the time. Their weekly reports of condition were awaited every Saturday as an index of the state of the money-market and the exchanges; but this index was incomplete and sometimes misleading, because regular weekly reports were not made by trust companies. It was announced early in 1908 by the state superintendent of banking that he would exercise a power vested in him by law to require weekly reports in future from trust companies, so that the two classes of reports would present a substantially complete picture of banking conditions in New York.

The statistical information is contained in the annual reports of the comptroller of the currency of the United States, published annually at Washington.

C. A. C.

ENGLISH LAW AFFECTING BANKS AND THEIR CUSTOMERS

ISSUE OF NOTES.—The legislation which culminated in the Bank Charter Acts of 1844 and 1845 secured to the Bank of England the absolute monopoly of the note issue within the city of London and a 3-m. radius. Outside that radius, and within 65 m. of the city, there is a concurrent right in banks, consisting of six or less than six persons, established before 1844, and issuing notes at that date; beyond the 65-m. radius the privilege may be exercised by all banks established before 1844, and then issuing notes, who have not since lost their right to do so by bankruptcy, abandonment of business, or temporary suspension of issue. According to some authorities, the effect of 20 and 21 Vict. cap. 49, sec. 12 [re-enacted Companies Consolidation Act 1908, sec. 286(d)] was to sanction the issue in the constitution of any bank issuing notes outside the 3-m. and within the 65-m. radius fixing such a six or less persons without affecting the power to issue notes. The case of In re Absorbed Bank, 11 L.T. 516, involved the number of joint-stock banks and the gradual absorption of the smaller and older concerns have had the effect of minimizing the output of notes other than those issued by the Bank of England, and, as exemplified by the case of The Attorney-General v. Birkbeck, 12 Q.B.D. 57, it would seem impossible to devise any scheme by which the note-issuing power of an absorbed bank could be continued to the new or amalgamated body. But a bank having the right would not necessarily lose it by absorbing other banks (Capital and Counties Bank v. Bank of England). Foreign banks may establish branches in Great Britain on complying with the regulations imposed on them by the Companies Consolidation Act 1908, but cannot apparently issue notes, even though payable abroad.

Deposition Business.—The term "bank of deposit" gives a mistaken idea of the real relation between banker and customer. So long ago as 1848 it was decided by the House of Lords in Foley v. Hill, 2 H. L. 28, that the real relation between banker and customer was that of debtor and creditor, not in any sense that of trustee and custodius quae trust, or depositee and depositor, as had been formerly supposed and contended. The ordinary process by which a man pays money in to his account at his banker's is in law simply lending the money to the bank; it fixes the banker with no fiduciary relation, and he is in no way responsible to the customer for the use he may make of the money so paid in. And as being a mere debt, a customer's right to recover money paid in is barred on the expiration of six years by the Statute of Limitations, if there has been no payment made with account of goods or of money, interest, and the acknowledgment sufficient to bar the statute (Pennant v. Claxton, 12 M. & W. 321). Such a state of affairs, however, is hardly likely to arise, inasmuch as in the absence of specific appropriation, earlier drawings out are attributed to the earlier payments in, as in the ordinary case of current accounts, and so the items on the credit and debit side cancel each other. An apparent exception to this system of appropriation exists in cases where a man wrongfully pays into his own account moneys held by him in a fiduciary capacity. In such circumstances he is presumed to have drawn out his own moneys rather than those affected by the trust, and so long as the account is in credit, any balance will be attributed to the trust money. As between contending claims to the money, based on different breaches of trust, the ordinary rule of appropriation will apply.

It has often been suggested that the only method of withdrawing money from a banker is by cheque, that the presentation of a cheque is a condition precedent to the liability of the banker to repay. This is not so; such a view being inconsistent with the cases establishing the effect of the Statute of Limitations on money left in a banker's hands, and in the normal case in which a balance at a bank has been attached as a simple and unconditional debt by a garnishee order, as, for instance, in Rogers v. Whiteley, 1807, 4 A.C. 116. The banker's position with regard to cheques is that, superadded to the relation of debtor and creditor, there is an obligation to honour the customer's cheques provided the banker has a sufficient and available balance in his hands for the purpose (Foley v. Hill). If, having such funds in his hands, the banker dishonours a cheque, he is liable to the customer in substantial damages without proof of actual injury having accrued (Rolin v. Steward, 14 C.B. 593). Where several cheques are presented simultaneously and the available balance is insufficient to pay all, the banker should pay as many as the funds will cover, and is not bound to discriminate between particular cheques. It would seem a legitimate condition that a cheque should be drawn in the ordinary recognized form, not in one raising any question or doubt as to its validity or effect. Cheques drawn to "wages or order," "petty cash or order," or the like, are common, and are sometimes regarded as payable to bearer. Such payees are not, however, "fictitious or non-existent persons," so as to render the cheque payable to the bearer under sec. 7, subs. 3 of the Bills of Exchange Act 1882, nor can such payees endorse. Some banks refuse to pay such cheques, and is it considered they are not in so doing. Money paid in so shortly before the presentation of the cheque that there would not have been time to pass it through the books of the bank would not be treated as available for drawing against. If a person have an account at one branch of a bank, he is not entitled to draw cheques on another branch.
where he has either no account or is overdrawn, but the bank has, as against the customer, the right to combine accounts at different branches and treat them as one account (Garnet v. M'Gowan, L.R. 8 Ex. 10). Funds are not available so long as on a garnishee order, founded on a judgment against the customer, is pending, since it attaches all moneys on current account irrespective of the amount of the judgment (Rogers v. Whiteley).

The very questionable practice of post-dating cheques has been the source of considerable doubt and inconvenience to bankers. The use of such documents enables the drawer to obtain the results of a bill at a fixed future date without the expense of a regular bill-stamp. But the Bills of Exchange Act 1882, sec. 13, sub.s. 1, provides that “a bill is not invalid by reason only that it is ante-dated or post-dated, or that it bears date on a Sunday.” The banker cannot therefore refuse to pay a cheque presented after the apparent date of its issue on the ground that he knows it to have been post-dated. On the other hand, he is entitled and indeed bound to refuse payment if such a cheque is presented before the apparent date of its issue (Morley v. Cuberwell, 7 M. & W. at p. 178). Revocation of authority to pay a cheque must come to the banker by conscientious knowledge and observance of his powers and method of communication. He is not bound to act on an unconfirmed telegram (Curtice v. London City & Midland Bank [1908], 1 K.B. 293). The banker’s authority to pay cheques is terminated by the death, insanity or bankruptcy of the customer, or by notice of an available act of bankruptcy committed by him.

The banker is bound to observe secrecy with respect to the customer’s account, unless good cause exists for disclosure, and the obligation does not cease if the account becomes overdrawn (Hardy v. Vasey, L.R. 3 Ex. 107). In England a cheque is not an assignment of funds in the banker’s hands (Bills of Exchange Act 1882, sec. 53). The holder of the cheque has therefore no claim on the banker in the event of payment being refused, his remedy being against the drawer and endorser, if any. On this section is also based the custom of English bankers not to pay part of the amount of a cheque where there are funds, though not sufficient to meet the whole amount. The section does not apply to Scotland, where it would seem that the bank is bound to pay over what funds it has to satisfaction of the cheque. A bank is entitled to hold paid cheques as vouchers until there has been a settlement of account between him and the customer. The entries in a pass-book constitute prima facie evidence against the banker, and when returned by the customer without comment, against him; but the proposition that such return constitutes a settlement of account has been much disputed. Indeed where forgery is the ground of repudiation of a cheque, no dealings or omissions of the customer with regard to the pass-book would seem to preclude him from objecting to being debited and throwing the loss on the banker (Kepitigalla Rubber Co. v. National Bank of India, 25 Times L.R. 402). As against the banker, however, credit entries in the pass-book cannot be disputed if the customer has altered his position in reliance thereon, and cheques drawn against an apparent balance must be honoured (Holland v. Manchester & Liverpool District Bank, 25 Times L.R. 386).

The rule by which the holder of a cheque has no direct recourse against the banker who dishonours it, holds good even where the bank has before issue marked the cheque as good for the amount, such marking not amounting to an acceptance by the banker. As between banker and banker, however, such marking or certifying probably amounts to a binding representation that the cheque will be paid, and, if done by request of the drawer, the latter cannot subsequently revoke the authority to pay. In certain circumstances, marking at the instance of the person presenting the cheque for payment may amount to an undertaking by the banker to hold the money for his benefit (In re Beaumont [1902], 1 Ch. p. 805).

A banker either paying or collecting money on a cheque to which the person tendering it for payment or collection has no title or a defective title is prima facie liable to the true owner for conversion or money had and received, notwithstanding he acted in perfect good faith and derived no benefit from the operation. Payment of an open cheque, payable to bearer either originally or by endorsement, is, however, in all cases a good payment and discharge (Charles v. Blackwell, 2 C.P.D. at p. 158). Limited protection in other cases has been extended by legislation to the banker with regard to both payment and collection of cheques, usually on the principle of counterbalancing some particular risk imposed on him by enactments primarily designed to safeguard the public.

By sec. 19 of the Stamp Act 1853, the banker paying a draft or order payable to order on demand, drawn upon him, was relieved from liability in the event of the endorsement having been forged or unauthorized. This enactment was not repealed by the Bills of Exchange Act 1882, and, in London City & Midland Bank v. Gordon (1903), A.C. 240, was held to cover the case of drafts drawn by a branch of a bank on its head office. Sec. 60 of the Bills of Exchange Act 1882 extends like protection to the banker in the case of cheques, the definition of which therein as “bills drawn on a banker payable on demand” đuas drafts of the above-mentioned description. Such definition, involving the unconditional character of the instrument, also precludes from the above-mentioned sections of the Bills of Exchange Act 1882 cheques frequently issued by corporations and others, which direct banks take for payment on a specific attached receipt being duly signed (London City & Midland Bank v. Gordon). Sec. 17 of the Revenue Act 1883, however, applies to these documents the crossed cheques sections of the Bills of Exchange Act 1882 (see Bovis, Jr., & Sims v. London & South-Western Bank [1900], 1 Q.B. 270), while denying them the position of negotiable instruments, and a banker paying one of them crossed, in accordance with the crossing and in the absence of any indication of its having been transferred, could probably claim immunity under sec. 80. The Bills of Exchange Act 1882 contains no direct prohibition against a banker paying a crossed cheque otherwise than in accordance with the crossing, but if he do so he is liable to the true owner for any loss suffered by him in consequence of such payment (sec. 79), and is probably unable to charge his customer with the amount. A banker paying a crossed cheque in accordance with its ostensible tenor obtains protection under sec. 80 and the proviso to sec. 79. Questions have been raised as to the bearing of the crossed cheques sections of a bank when a crossed cheque drawn on one branch of a bank is paid in for collection by a customer at another branch; but the transaction is so obviously a legitimate and necessary one that either by the collecting branch may be regarded as a separate bank for this purpose, or sec. 79 may be ignored as inapplicable (Gordon v. London City & Midland Bank [1902], 1 K.B. 242 C.A.).

The collection of crossed cheques for a customer being virtually incumbent on a banker, qualified immunity is accorded him in so doing by sec. 82, a final exposition of which was given by the House of Lords in London City & Midland Bank v. Gordon (1903), A.C. 240. To come within its provisions, the banker must fulfil the following conditions. He must receive the cheque from, and the money for, a customer, i.e. a person with whom he has definite and existing business relations (see Great Western Ry. Co. v. London & County Bank [1901], A.C. 414). He must take the cheque already crossed generally or specially to himself. His act crossing under sec. 77 is absolutely inexcusable in this connexion. He must take the cheque and receive the money in good faith and without negligence. Negligence in this relation is the omission to exercise due care in the interest of the true owner, not necessarily the customer. To avoid this disqualification of negligence, the banker must see that the endorsements, where necessary, are ostensibly correct; he must satisfy himself of the authority where an endorsement is per procuration; he must not take for private account a cheque which on its face indicates that the holder is in possession of it as agent, or in an official capacity, or for partnership purposes (Hannan’s Lake View Central Ltd. v. Armstrong & Co., 16 Times L.R. 236; Bevan v. National Bank, 23 Times L.R. 65); he must not take a cheque marked “account payee” for an account other than that...
indicated (Bouw v. National Bank). It is further demonstrated by the Gordon case that the banker only secured protective loss in his capacity as a conduit pipe, or as an agent for the customer. If he holds the position of owner of the cheque, he no longer fulfils the condition of receiving the money only for the customer. In the Gordon case, adoption of the not uncommon practice of crediting cheques as cash in the bank's books before the money was actually received was held equivalent to taking them as transference or owner, and to debar the bank from the protection of sec. 82. The anxiety and inconvenience caused to bankers by this unexpected decision was ultimately removed by the Bills of Exchange (Crossed Cheques) Act 1906, which enacts that a banker receives payment of a crossed cheque for a customer within the meaning of sec. 82 of the Bills of Exchange Act 1882, notwithstanding that he credits his customer's account with the amount of the cheque before receiving payment thereof. Apparently the scope of this act must be confined to its immediate object, and it does not affect the relations and rights between the banker and his customer or parties to the cheque arising from such crediting as cash. For instance, the customer, in the absence of agreement to the contrary, may at once draw against cheques so credited, while the banker may still debit the customer with the amount of the cheque if returned unpaid, or sue the drawer or indorser thereon.

The protection to the collecting banker is in no way affected by the cheque being crossed "not negotiable," or by the nature of the fraud or crime by which the cheque was obtained by the customer or any previous possessor, although there are dicta which have been interpreted in the contrary sense. Nor does the fact that the customer is overdrawn deprive the banker of the character of a collecting agent, unless the cheque be definitely given and taken in reduction of such overdrawn. Where the conditions requisite for protection exist, the protection covers not only the receipt of the money, but all operations usual in business and leading up to such receipt, on the basis of the customer's title being unimpeachable. The provisions of the crossed cheques sections of the Bills of Exchange Act 1882 are extended to dividend warrants by sec. 95 of that act, and to certain orders for payment issued by a customer of a banker by sec. 17 of the Revenue Act 1853, as before stated. But the wording of the Bills of Exchange (Crossed Cheques) Act 1906, specifying as it does cheques alone, appears to exclude documents of both these classes from its operation. With regard to the orders for payment, inasmuch as the same section which brings them within the crossed cheques sections expressly provides that they shall not be negotiable, a banker would probably be protected only in taking them from the specified payee, though this distinction has been ignored in some recently decided cases.

Where a banker incurs loss through forgery or fraud in circumstances not covered by statutory protection, his right to relief, if any, must depend on general principles. He cannot charge his customer with payments made on a forgery of that customer's signature, or of another person presumed to know such signature or that the payment is unauthorized. But if the customer has accredited the forgery, or, having knowledge or reasonable ground for belief that it has been committed, has failed to warn the banker, who has thereby suffered loss or prejudice, the customer will be held estoppel from disputing the banker's right to debit him with the amount (Vaglino v. Bank of England [1891], A.C. 107; McKensie v. British Linen Co. 6 A.C. 82; Ewing v. Dominion Bank [1904], A.C. 806). The doctrine of the fictitious person as payee may also exonerate a banker who has paid an order bill to a wrongful possessor. Payment on a forgery to an innocent holder is payment under mistake of fact; but the ordinary right of the payor to recover money so paid is subordinated to the necessity of safeguarding the characteristics of negotiability. Views differ as to whether the recovery is precluded only where the opportunity of giving notice of dishonour is lost or prejudiced by delay in reclaiming payment, or whether mere possibility of damage is sufficient (cf. London & River Plate Bank v. Bank of Liverpool [1860], 1 Q.B. 7, and Imperial Bank of Canada v. Bank of Hamilton [1903], A.C. 48).

Cases have frequently arisen where the carelessness of a customer in filling up cheques has enabled a person to fraudulently increase the sum for which such cheques were originally drawn. In Colonial Bank of Australasia v. Marshall [1906], A.C. 590, the judicial committee of the privy council held that the affording such facilities for forgery was no breach of the customer's duty to his banker, and that the latter was not entitled to debit the customer with more than the original amount. As before stated, the customer's dealings with the pass-book cannot, in the present state of the authorities, be relied on as depriving unauthorized payments appearing therein.

The payment of bills accepted payable at the bank is not, like the payment of cheques, an essential obligation of the banker, and the risk involved is enhanced by the fact that the banker must pay or refuse payment at once, no interval being allowed for verification of endorsements. The abolition or modification of the practice has frequently been advocated, but it is one of the facilities which competition compels bankers to extend to their customers. On the same basis stands the receipt of a customer's valuables for safe custody. The question of the banker's responsibility for the loss of goods so deposited with him was raised, but not decided, in an action brought by Mrs Langtry against the Union Bank of London in 1896. Certain jewels belonging to her had been delivered up by the bank to an unauthorized person on a forged order. The case was settled; but bankers being desirous to ascertain their real position, many legal opinions were taken on the point, and after consideration of these, the Central Association of Bankers issued a memorandum, in which they stated that the best legal opinion appeared to be that a distinction must be drawn between cases in which valuables were by mistake delivered to the wrong person and cases in which they were destroyed, lost, stolen or fraudulently abstracted, whether by an officer of the bank or some other person. That in the former case the question of negligence did not arise, the case being one of wrongful conversion of the goods by a valuables act for which the bank was liable apart from any question of negligence. That, in the second case, that of loss or theft, the banker, being a gratuitous bailee, would only be liable if he had failed to use such care as an ordinary prudent man would take of valuables of his own. The latter rule is practically that laid down in Gillin v. MacMullen, L.R. 2 P.C. 318, but in estimating the amount of care to be taken by the banker, the nature of the goods, if known or suspected, and the exceptional means of protection at the disposal of bankers, such as strong rooms, must be taken into consideration. Methods of obviating both classes of risk by means of special receipts have frequently been suggested, but such receipts do not appear to have come into general use.

Theoretically, bankers are supposed to refuse accounts which are either expressly or are known to be trust accounts. In practice, however, it is by no means uncommon to find accounts opened on a definite heading indicating the fiduciary capacity. In such cases, the chairman of the court which affect the banker with notice of that capacity. In either cases, however, the obligation to honour the customer's cheque is the predominant factor, and the banker is not bound or entitled to question the propriety or object of the cheque, unless he has very clear evidence of impending fraud (Gray v. Johnston, L.R. 3 H. of L. 1). Even though the banker have derived some personal benefit from the transaction, it cannot be impeached unless the banker's conduct amount to law to his being party or privy to the fraud, as where he has stipulated, or pressed for the settlement or reduction of an ascertained overdraft on private account, which has been effected by cheque on the trust account (Coleman v. Bucks & Oxon Union Bank [1897], 2 Ch. 243). A banker is entitled, in dealing with trust monies, known to be such, to insist on the authority of the whole body of trustees, direct and not deputed, and this is probably the safest course to adopt. Scarcely larger responsibility devolves on Joint Stock Banks appointed custodian trustees under the Public Trustee Act 1906,
a remunerative position involving custody of trust funds and securities, and making and receiving payments on behalf of the estate, while leaving the active direction thereof in the hands of the managing trustees. Other incidents of the ordinary practice of banking are the discounting of bills, the keeping of deposit accounts, properly so called, and the making of advances to customers, either by way of definite loan or arranged overdraft.

Bill-discounting. So far as the discounting of bills is concerned, there is little to differentiate the position of the bank from that of any ordinary bill-discounter. It has been contended, however, that the peculiar attribute of the banker's lien entitled him to hold funds of the customer against his liability on current discounted bills. This contention was ultimately disposed of by Bowen v. Foreign & Colonial Gas Company, 22 W.R. 740, where it was pointed out that the essential object of a customer's discounting bills with his banker was to fund the current account, and that a possible liability constituted no set-off against an existing debt. Whether a particular bill has been taken for discount or collection is a question of fact. As in the payment of bills, so in the collection of them, there is no statutory protection whatever for the banker; as against third parties he can only rely either on the customer's title or his own as a holder for value, if no forged endorsement intervene and he can establish a consideration.

A deposit account, whether at call or on fixed notice, does not constitute any fiduciary relation between the depositor and the banker, but merely a debt due from the latter to the former. It has been suggested that cheques can be drawn against deposit account on call, and, though a banker might safely honour such a cheque, relying, if necessary, on his right of lien or set-off, there appears no legal right in the customer to enforce such payment. Deposit receipts given by bankers are exempt from stamp duty, even though they contain an undertaking with respect to payment of principal and interest. They are clearly not negotiable instruments, but it is difficult to deduce from the cases how far dealings with them may amount to an equitable assignment of the moneys they represent. Probably deliberate defined transfer, coupled with endorsement, would confer an effective title to such moneys. Where, as is not uncommon, the form of deposit note includes a cheque, the banker, contrary to his practice, the cheque presented and any superadded formalities complied with.

There is no obligation on a banker to permit his customer to overdraw, apart from agreement express or implied from course of business. Drawing a cheque or accepting a bill payable at the banker's which there are not funds to meet is an implied request for an overdraft, which the banker may or may not comply with. Interest is clearly chargeable on overdrafts whether stipulated for or not. There is no direct authority establishing this right in the banker, and interest is not usually recoverable on mere debts, but the charge is justifiable on the ground of the universal custom of bankers, if not otherwise. The charging of compound interest or interest with periodical rests has been supported where such system of keeping the accounts has been brought to the notice of the customer by means of the pass-book, and not objected to by him, but in the present attitude of the courts towards the pass-book some further recognition would seem necessary. Such system of charging interest, even when fully recognized, only prevails so long as the relation of banker and customer, on which it is founded, is continuing; if taking a mortgage for the existing debt would put an end to it. The main point in which advances made by bankers differ from those made by other people is the exceptional right possessed by bankers of securing repayment by means of the banker's lien. The banker's lien is part of the law merchant and entitles him, in the absence of agreement express or implied to the contrary, to retain and apply, in discharge of the customer's liability to him, any securities of the customer coming into his possession in his capacity as banker. It includes bills and cheques paid in for collection (Currie v. Misa, 1 A.C. 564). Either by virtue of it, or his right of set-off, the banker can retain moneys paid in by or received for the credit of the customer, e.g., in the banker's debt to him. Goods deposited for safe custody or moneys paid in to meet particular bills are exempt from the lien, the purpose for which they come to the banker's hands being inconsistent with the assertion of the lien. The existence of the banker's lien entitles him to sue all parties to bills or cheques by virtue of sec. 27, subs. 3 of the Bills of Exchange Act, and to the extent of his advances his title is independent of that of the previous holder. Moreover, the banker's lien, though so termed, is really in effect an implied pledge, and confers the rights of realization on default pertaining to that class of bailment. But with regard to the exercise of his lien, as in many other phases of his relation to his customer, the banker's strict rights may be curtailed or circumscribed by limitations arising out of course of business. The principle, based either on general equity or estoppel and independent of definite agreement or consideration, requires that when dealings between banker and customer have for a reasonable space of time proceeded on a recognized footing, the banker shall not suddenly break away from such established order of things and assert his strict legal rights to the detriment of the customer. From this principle arises the doctrine of the banker's lien in particular cases, as for instance for an overdraft on one account against another which had habitually been kept and operated on separately. It equally prevents the dishonouring of cheques in circumstances in which they have hitherto been paid independent of the actual available balance.

Restrictions arising from course of business can of course be put an end to by the banker, but only on reasonable notice to the customer and by providing for outstanding liabilities undertaken by the latter in reliance on the continuance of the pre-existing state of affairs (see Buckingham v. London & Midland Bank, 12 Times L.R. 70). As against this, the banker can, in some cases, fortify his position by appeal to the custom of bankers. The validity of such custom, provided it be general and reasonable, has frequently been recognized by the courts. Any person entering on business relations with a banker must be taken to contemplate the existence of such custom and implicitly agree that business shall be conducted in accordance therewith. But of the question of the banker's lien, there is no such custom not already recognized in law, as to how far it can be established by the evidence of one party, the bankers, unsupported by that of members of the outside public, in most cases impossible to obtain. It is conceived, however, that on the analogy of local custom and the Stock Exchange rules, such outside evidence could be dispensed with, and this is the line apparently indicated with relation to the pass-book by the court of appeal in Vagiano's case (23 Q.B.D. at p. 245). The unquestionable right of the banker to summarily debit his customer's account with a returned cheque, even when unindorsed by the customer and taken by the banker in circumstances constituting him a transferee of the instrument, is probably referable to a custom of this nature. So is the common practice of bankers to refuse payment of a so-called "stale" cheque, that is, one presented an unreasonable time after its ostensible date; although the fact that some banks treat a cheque as stale after six months, others not till after twelve, might be held to militate against the validity of such custom, and lapse of time is not included by the Bills of Exchange Act among the matters which imply the banker's lien. And authority to make any such custom not already recognized in law, is probably referable to a custom of this nature.

The common practice of banks to refuse payment of a so-called "stale" cheque, that is, one presented an unreasonable time after its ostensible date; although the fact that some banks treat a cheque as stale after six months, others not till after twelve, might be held to militate against the validity of such custom, and lapse of time is not included by the Bills of Exchange Act among the matters which imply the banker's lien. And authority to make any such custom not already recognized in law, is probably referable to a custom of this nature.

That section does, however, import the custom of bankers into the reckoning of a reasonable time for the presentation of a cheque, and with other sections clears up any doubts which might have arisen on the common law as to the right of the holder of a cheque, whether crossed or not, to employ his banker for its collection, without imperilling his rights against prior parties in case of dishonour. On dishonour of a cheque paid in for
collection, the banker is bound to give notice of dishonour. Being in the position of an agent, he may either give notice to his principal, the customer, or to the parties liable on the bill. The usual practice of bankers has always been to return the cheque to the customer, and sec. 49, subs. 6 of the Bills of Exchange Act is stated to have been passed to validate this custom. Inasmuch as it only provides for the return of the dishonoured bill or cheque to the drawer or an endorser it appears to miss the case of a cheque to bearer or become payable to bearer by blank endorsement prior to the customer's.

Where a bank or a banker takes a mortgage, legal or equitable, or a guarantee as cover for advances or overdraft, there is nothing necessarily differentiating the position from that of any other mortgagee or guaranteed party. It has, however, fallen to banks to evoke some leading decisions with respect to the former class of security. In London Joint Stock Bank v. Simmons ([1862], A.C. 201) the House of Lords, professedly explaining their previous decision in Sheffield v. London Joint Stock Bank, 13 A.C. 333, determined that negotiable securities, commercial or otherwise, may safely be taken in pledge for advances, though the person tendering them is, from his known position, likely to be holding them merely as agent for other persons, so long as they are taken honestly and there is nothing tangible, outside the man's position, to arouse suspicion. So again in Lloyd's Bank v. Cooke [1907], 1 K.B. 704, the bank vindicated the important principle that the common law of estoppel still obtains with regard to bills, notes and cheques, save where distinctly annulled or abrogated by the Bills of Exchange Act, and that therefore a man putting inchoate negotiable instruments into the hands of an agent for the purpose of his raising money thereon is responsible to any one taking them bona fide and for value, although the agent may have fraudulently exceeded and abused his authority and the case does not fall within the provisions of the Bills of Exchange Act.

With regard to guarantees, the main incidents peculiarly affecting bankers are the following. The existence of a guarantee does not oblige the banker to any particular system of keeping the account. So long as it is not unfairly manipulated to the detriment of the guarantor, there is no obligation to put moneys paid in, without appropriation, to the guaranteed rather than to the unguaranteed account, and on the termination of a guarantee, the banker may close the account, leaving it to be covered by the guarantee, and open a new one with the customer, to which he may devote payments in, without otherwise appropriated. Where by its nature or terms a continuing guarantee is revocable either summarily or on specified notice, difficult questions may arise on such revocation as to the banker's duty and obligations towards the customer, who has probably incurred liabilities on the strength of the credit afforded by the guarantee. Although the existence of a guarantee does not bind the banker to advance up to the prescribed limit, he could not well, on revocation, immediately shut off all facilities to the customer without notice, and subsequently, purely voluntary advances might not be covered by the guarantee. These contingencies should therefore be fully provided for by the guarantee, particularly the crucial period of the pendency of notice.

BANKSIA, an Australian genus of shrubs and trees (natural order Proteaceae), with leathery leaves often deeply cut and handsome dense spikes of flowers. It is named after Sir Joseph Banks (q.v.). The plants are generally found in England for their handsome foliage, though not often in flower houses shrubs.

BANKURA, a town and district of British India, within the Burdwan division of Bengal. The town has a population of 20,737. The district has an area of 2621 sq. m., and in 1901 its population was 1,116,411, showing an increase of 4% in the decade. It is bounded on the N. and E. by Burdwan district, on the S. by Midnapur district; and on the W. by Manbhum district. Bankura forms a connecting link between the delta of the Ganges on the E. and the mountainous highlands of Chota Nagpur on the W. Along its eastern boundary adjoining Burdwan district the country is flat and alluvial, presenting the appearance of the ordinary sandy lands of Bengal. Going N. and W., however, the surface gradually rises into long undulating tracts; rice lands and swamps give way to a region of low thorny jungle or forest trees; the hamlets become smaller and more scattered, and nearly disappear altogether in the wild forests along the western boundary. Large quantities of lac and tussur silk are gathered in the hilly tract. The stone quarries and minerals are little worked. There are indigo factories and two coal-mines. Both cotton and silk are woven, and plates, &c., are carved from soap-stone. The old capital of the country was at Bishnupur, which is still the chief centre of local industries. The north-east part of the district is skirted by the East Indian railway beyond the river Damodar. The Midnapur-Jhuria line of the Bengal-Nagpur railways passes through the district, and there is a line from Howrah to Bankura. The climate of Bankura is generally healthy, the cold season being bracing, the air wholesome and dry, and fogs of rare occurrence. The district is exposed to drought and also to destructive floods. It suffered in the famines of 1866, 1874-1875 and 1896-1897. The temperature in the hot season is very oppressive and relaxing. The Bishnupur Raj was one of the largest estates in Bengal in the end of the 18th century, but it was sold for arrears of revenue shortly after the conclusion of the permanent settlement in 1793.

BANN, the principal river in the north of Ireland. Rising in the Mourne mountains in the south of the Co. Down it runs N.W. until it enters Lough Neagh (q.v.), which it drains N.N.W. to an estuary at Coleraine, forming Lough Beg immediately below the larger lough. The length of its valley (excluding the lesser windings of the river) is about 90 m. The total drainage area, including the other important feeder of Lough Neagh, is about 3300 sq. m., extending westward to the confines of the Co. Fermanagh, and including parts of the Co. Down and Antrim, Armagh and Monaghan, Tyrone and Londonderry. The river has valuable salmon fisheries, but is not of much importance for navigation. Above Lough Neagh it is known as the Upper Bann and below as the Lower Bann.

BANNATYNE, George (1545-1608), collector of Scottish poems, was a native of Newtyle, Forfarshire. He became an Edinburgh merchant and was admitted a burgess in 1587. Some years earlier, in 1568, when the "pest" raged in the capital, he retired to his native county and amused himself by writing out copies of poems by 15th and early 16th century Scots poets. His work extended to eight hundred folio pages, divided into five parts. The MS. descended to his only daughter Janet, and later to her husband's family, the Foulis of Woodhall and Ravelston, near Edinburgh. From them it passed to the Advocates' Library, and is still preserved. This MS., known as the "Bannatyne Manuscript," constitutes with the "Asloan" and "Middle and Folio" MSS. the chief repository of Middle Scots poetry, especially for the texts of the greater poets Henryson, Dunbar, Lyndsay and Alexander Scott. Portions of it were reprinted (with modifications) by Allan Ramsay in his Ever Green (1724), and latter, and more correctly, by Lord Hailes in his Ancient Scottish Poems (1770). The entire text was issued by the Hunterian Club (1873-1902) in a handsome and generally accurate form. The name of Bannatyne was honoured in 1823 by the foundation in Edinburgh of the Bannatyne Club, devoted to the publication of historical and literary material from Scottish sources. The thirty-third issue of the club (1829) was Memorials of George Bannatyne (1545-1608), with a memoir by Sir Walter Scott and an account of the MS. by David Laing.

See also Gregory Smith, Specimens of Middle Scots (1902).

BANNERET (Fr. banneiret, de bannière, banner, elliptical for seigneur or chevalier bannered, Med. Lat. bannercus), in feudalism, the name given to those nobles who had the right to lead their vassals to battle under their own banner. Ultimately bannerets obtained a place in the feudal hierarchy between
barons and knights bachelors, which has given rise to the idea that they are the origin of King James I.'s order of baronets. Selden, indeed, points out that "the old stories" often have appeared; for bannetted is his name, and he points out that in France the title had become hereditary; but he himself is careful to say (p. 680) that bannet " hath no relation to this later title." The title of knight bannet, with the right to display the private banner, came to be granted for distinguished service in the field. "No knight bannet," says Selden, of the English custom, "can be created but in the field, and that, when either the king is present, or at least his royal standard is displayed. But the creation is almost the same with that in the old French ceremonies by the solemn delivery of a banner charged with the arms of him that is to be created, and the cutting of the end of the pennon or streamer to make it a square or into the shape of a banner in case that he which is to be created had in the field his arms on a streamer before the creation." The creation of banneters is traceable, according to Selden, to the time of Edward 1. "Under these banneters," he adds, "divers knights bachelors and esquires usually served; and according to the number of them, the banneters received wages." The last authentic instance of the creation of a knight bannet was that of John Smith, created bannet at the battle of Edgcill by Charles I. for fighting the standards from the army.

BANNERS, FEAST OF (Jap. Nobori-no-Schku), a Japanese festival in honour of male children held on the 5th of May. Every householder who has sons fastens a bamboo pole over his door and hangs from it gaily-coloured paper fishes, one for each of his boys. These fishes are made to represent carp, which are in Japanese folklore symbolical of health and longevity. The day is recognized as a national holiday.

For banners in general see *Flag."

BANISTER, CHARLES (1738–1824), English actor and singer, was born in Gloucestershire, and after some amateur and provincial experience made his first London appearance in 1762 as Will in *The Orators* at the Haymarket. Gifted with a fine bass voice, Banister acquired a reputation as a singer at Ranelagh and elsewhere, as well as an actor, and was received with such favour that Garrick engaged him for Drury Lane. He died on the 26th of October 1824.

His son John Banister (1760–1836), born at Deptford on the 12th of May 1760, first studied to be a painter, but soon took to the stage. His first formal appearance was at the Haymarket in 1778 as Dick in *The Apprentice*. The same year at Drury Lane he played in James Miller's version of Volttaire's *Mahomet* the part of Zaphna, which he had studied under Garrick. The Palmira of the cast was Mrs Robinson ("Perdita"). Banister was the best low comedian of his day. As manager of Drury Lane (1802) he was no less successful. He retired in 1815 and died on the 7th of November 1836. He never gave up his taste for painting, and Gainsborough, Morland and Rowlandson were among his friends.

BANNOCK (adapted from the Gaelic, and apparently connected with Lat. panis, bread), the term used in Scotland and the north of England for a large, flatish, round sort of bun or cake, usually made of barley-meal, but also of wheat, and sometimes with curants.

BANNOCK, the name of a county in the south-east of the state of Idaho, U.S.A., and of a river in the same state, which runs northward in Oneida county into the Snake or Lewis river. It is taken from that of the Bannock Indians (see *Bannate*), a corruption of the native *Panaiti.*

BANNOCKBURN, a town of Stirlingshire, Scotland. Pop. (1901) 2444. It is situated on the "burn" from which its name is derived, the Bannock (Gaelic, ban oc, "white, shining stream"); a right-hand affluent of the Forth, which was once a considerable river. The town lies 24 m. S.S.E. of Stirling by the Caledonian railway, and now has thriving manufactures of woollens (chiefly treeds, carpets and tartans) and leather, though at the beginning of the 19th century it was only a village. The Bore Stone, in which Bruce planted his standard before the battle in which he defeated Edward II. in 1314 (see below), is preserved by an iron grating. A mile to the west is the Gillies' Hill, now finely wooded, over which the Scots' camp-followers appeared to complete the discomfiture of the English, to which event it owes its name. Bannockburn House was Prince Charles Edward's headquarters in January 1746 before the fight at Falkirk.

The famous battle of Bannockburn (24 June 1314) was fought for the relic of Stirling Castle, which was besieged by the Scottish forces under Robert Bruce. The English governor of Stirling had promised that, if he were not relieved by that date, he would surrender the castle, and Edward II. hastily collected an army in the northern and midland counties of England. Bruce made no attempt to defend the border, and selected his defensive position on the Bannock Burn, 23 m. S. of Stirling. His front was covered by the marshy bed of the stream, his left flank by its northern bend towards the Forth, his right by a group of woods, behind which, until the English army appeared, the Scots concealed themselves. Two corps were left in the open to watch the low ground, one to garrison the burn, one to guard the point at which the Falkirk-Stirling road crosses the burn. On the 23rd the van of the army of Edward, which numbered about 60,000 against the 40,000 of the Scots, appeared to the south of the burn and at once despatched two bodies of men towards Stirling, the first by the direct road, the other over the lower Bannock Burn near its junction with the Forth. The former was met by the Scottish outpost on the road, and here occurred the famous single combat in which Robert Bruce, though not fully armed for battle, killed Sir Henry Bohun. The English corps which took the other route was met and after a severe struggle defeated by the second Scottish outpost near Ninian's. The English army assembled for battle on the following day. Early on St John's day the Scottish army took up its assigned positions. Three corps of pikemen in solid masses formed the first line, which was kept out of sight behind the crest until the enemy advanced in earnest. A line of "pottoes" (military pits) had been previously dug to give additional protection to the front, which extended for about one mile from wing to wing. The right wing consisted of the remnant of the Æthelred's army and a squadron of 500 chosen men-at-arms under Sir Robert Keith, the marshall of Scotland. The line of the defenders was unusually dense; Edward, in forming up on an equal front with greatly superior numbers, found his army almost hopelessly cramped. The attacking army was formed in an unwieldy mass of ten "battles," each consisting of horse and foot, and the whole formed in three lines each of three "battles," with the tenth "battle" as a reserve in rear. In this order the English moved down into the valley for a direct attack, the cavalry of each "battle" in first line, the foot in second. Ignoring the lesson of Falkirk (q.v.), the mounted men rode through the morass and up the slope, which was now crowned by the three great masses of the Scottish pikemen. The attack of the English failed to make any gap in the line of defence, many knights and men-at-arms were injured by falling into the pits, and the battle became a mêlée, the Scots, with better fortune than at Falkirk and Flodden, presenting always an impenetrable hedge of spears, the English, too stubborn to draw off, constantly thronging in vain to break it down. So great was the pressure that the "battles" of the second line which followed the first were unable to reach the front and stood on the slope, powerless to take part in the battle on the crest. The advance of the third English line only made matters worse, and the sole attempt to deploy the archers was crushed with great slaughter by the charge of Keith's mounted men. Bruce threw his infantry reserve into the battle, the arrows of the English archers wounded the men-at-arms of their own side, and the remnants of the leading line were tired and disheartened when the final impetus to their rout was given by the historic charge of the "gillies," some thousands of Scottish camp-followers who suddenly emerged from the woods, blowing horns, waving such weapons as they possessed, and holding aloft...
improvised banners. Their cries of "slay, slay!" seemed to the wearied English to betoken the advance of a great reserve, and in a few minutes the whole English army brake and fled in disorder down the slope. Many perished in the burn, and the demoralized fugitives were hunted by the peasantry until they re-crossed the English border. One earl, forty-two barons and bannerets, two hundred knights, seven hundred esquires and probably 10,000 foot were killed in the battle and the pursuit. One earl, twenty-two barons and bannerets and sixty-eight knights fell into the hands of the victors, whose total loss of 4,000 men included, it is said, only two knights.

BANNS OF MARRIAGE (formerly banes, from A.S. gebban, proclamation, Fr. ban, Med. Lat. bannum), the public legal notice of an impeding marriage. The church in earliest days was forewarned of marriages (Tertullian, "Ad Uxorem, De Pudicitia", c. 4). The first canonical enactment on the subject in the English church is that contained in the 11th canon of the synod of Westminster in London (A.D. 1200), which orders that "no marriage shall be contracted without banns thrice published in the church, unless by special authority of the bishop." It is, however, believed that the practice was in France as old as the 9th century, and certainly Od, bishop of Paris, ordered it in 1176. Some have thought that the custom originated in the ancient rule that all "good knights and true," who elected to take part in the tournaments, should hang up their shields in the nearest church for some weeks before the opening of the lists, so that, if an "impeachment" existed, they might be "warned off." By the Lateran Council of 1215 the publication of banns was made compulsory on all Christendom. In early times it was usual for the priest to betroth the pair formally in the name of the Blessed Trinity; and sometimes the banns were published at vespers, sometimes during mass. In the United Kingdom, under the canon law and by statute, banns are the normal preliminary to marriage; but a marriage may also be solemnized without the publication of banns, by obtaining a licence or a registrar's certificate. In America there is no statutory requirement; and the practice of banns (though general in the colonial period) is practically confined to the Roman Catholics.

BANNU, a town and district of British India, in the Derajat division of the North-West Frontier Province. The town (also called Edwardesabad and Dhublinagar) lies in the north-west corner of the district, in the valley of the Kurrum river. Pop. (1901) 14,300. It forms the base for all punitive expeditions to the Tochi Valley and Waziri frontier.

The district of Bannu, which only consists of the Bannu and Marwat tahsils since the constitution of the North-West Frontier Province in 1901, contains an area of 1,680 sq. m. lying north of the Indus. The cis-Indus portions of Bannu and Dera Ismail Khan now comprise the new Punjab district of Mianwali.

In addition to the Indus the other streams flowing through the district are the Kurrum (which falls into the Indus) and its tributary the Gambila. The valley of Bannu proper, stretching to the foot of the frontier hills, forms an irregular oval, measuring 60 m. from north to south and about 40 m. from east to west. In 1901 the population was 231,485, of whom the great majority were Mahommmedans. The principal tribes inhabiting the district are: (1) Waziri Pathans, recent immigrants from the hills, for the most part peaceable and good cultivators; (2) Marwats, a Pathan race, inhabiting the lower and more sandy portions of the Bannu valley; (3) Bannuks, a mongrel Afghan tribe of bad physique and mean vices. The inhabitants of this district have always looked upon themselves as independant, and stubbornly resisted the Afghan and Sikh predecessors of the British. After the annexation of the Punjab the valley was administered by Herbert Edwards so thoroughly that it became a source of strength instead of weakness during the Mutiny. The inhabitants of the valley itself are now peaceful, but it is always subject to incursion from the Waziri tribes in the Tochi valley and the neighbouring hills. Salt is quarried on government account at Kalabagh and alum is largely obtained in the same neighbourhood. The chief export is wheat. A military road leads from Bannu town towards Dera Ismail Khan. The Indus, which is nowhere bridged within the district, is navigable for native boats throughout its course of 76 m. The chief frontier tribes on the border are the Waziris, Battans and Dwaris. All these are described under their separate names.

BANSDA, a native state in the south Gujarat division of Bombay, India, belonging to the Surat agency. Area, 215 sq. m. Pop. (1901) 40,382, showing a decrease of 2% in the decade; estimated revenue £10,508. Its chief is a rajput. About half the total area of the state is cultivable, but the bulk is forested.

BANSHEE (Irish bean sidhe; Gaelic ban sith, "woman of the fairies"), a supernatural being in Irish and general Celtic folklore, whose mournful screaming, or "keening," at night is held to foretell the death of some member of the household visited. In Ireland legends of the banshee belong more particularly to certain families in whose records periodic visits from the spirit are chronicled. A like ghostly apparition in Brittany folklore. The Irish banshee is held to be the distinction only of families of pure Milesian descent. The Welsh have the banshee under the name gwarch y Rhilyn (witch of Rhilyn). Sir Walter Scott mentions a belief in the banshee as existing in the highlands of Scotland (Demonology and Witchcraft, p. 351). A Welsh death-portent often confused with the gwarch y Rhilyn and banshee is the cykyraeth, the groaning spirit.

See W. Wirt Silkes, British Goblins (1880).

BANSWARA (literally "the forest country"), a rajput feudatory state in Rajputana, India. It borders on Gujarat and is bounded on the N. by the native states of Dungarpur and Udaipur or Mewar, on the N.E. and E. by Partabgarh; on the S.E. by the dominions of Holkar and the state of Jabalpur and on the W. by the state of Rewa Kantha. Banswara state is about 45 m. in length from N. to S., and 33 m. in breadth from E. to W., and has an area of 149,60 sq. m. The population in 1901 was 165,350. The Mahi is the only river in the state and great scarcity of water occurs in the dry season. The Banswara chief belongs to the family of Udaipur. During the reign of the Dfather empire Banswara formed one of its dependencies; on its decline the state passed under the Maharrats. Weared out by their oppressions, its chief in 1812 petitioned for English protection, on the condition of his state becoming tributary on the expulsion of the Maharrats. The treaty of 1818 gave effect to this arrangement, Britain guaranteeing the prince against external enemies and refractory chiefs; he, on his part, pledging himself to be guided by her representative in the administration of his state. The chief is assisted in the administra- tion by a bannadar or minister. The estimated gross revenue is £37,000 and the tribute £2500. The customs of suttee or widow-burning, has long been abolished in the state, but the people retain all their superstitions regarding witches and sorcery; and as late as 1870, a Bihl woman, about eighty years old, was swung to death at Kusbalgarh on an accusation of witchcraft. The perpetrators of the crime were sentenced to five years' rigorous imprisonment, but they had the sympathy of the people on their side. The chief town is Banswara, situated about 8 m. W. of the Mahi river, surrounded by an old disused rampart and adorned by various Hindu temples, with the battlements of the chief's palace overlooking it. Its population in 1901 was 709,339. The petty state of Kusbalgarh is feudatory to Banswara.

BANTAM, the westernmost residency of the island of Java, Dutch East Indies, bounded W. by the Strait of Sunda, N. by the Java sea, E. by the residencies of Batavia and Preanger, and S. by the residencies of the Free States of the Indies and Dwars-in-den-weg ("right-in-the-way") Island in Sunda Strait, as well as several smaller islands along the coasts. Bantam had a population in 1897 of 79,339, including 320 Europeans, 1929 Chinese and 89 Arabs and other Asiatic foreigners. The natives are Sundanese, except in the northern or Serang division, where they are Javanese. The coast is low-lying and frequently marshy. The northern portion of the residency constitutes the most fertile portion, is generally flat with a hilly group in the middle, where the two inactive volcanoes, Karang and Pulosari,
are found, while the north-western corner is occupied by the
isolated Gede Mountain. The southern portion is covered by
the Kendang (Malay for "range") Mountain, into which the
Preanger. The rivers are only navigable at their mouths.
Various geysers and cold and warm sulphur springs are found
in the centre of the residency, and on a ridge of the Karang Mountain
is the large crater-lake Danu, a great part of which was drained
by the government in 1835 for rice cultivation. Pulse (kachang),
rice and coffee are the principal products of cultivation; but
in the days of government culture sugar, indigo and especially
pepper were also largely grown. The former considerable fishling
and coastal trade was ruined by the eruption of Krakatoa in
1883, a large stretch of coast line and the seaports towns of
Charingin and Anjer being destroyed by the inundation.
The prosperity of the residency was further affected by an
outbreak of plague in 1879, followed by a fever epidemic which carried off
30,000 people, and except in the rice season there is a considerable
emigration of natives. Bantam contains five native regencies or
territorial divisions, namely, Serang, Anjer, Pandeglang,
Charingin, Lebak. The principal towns are Serang, the capital
of the residency, Chiliegon, Pandeglang, Menes and Rangkas
Betug. The chief town, Serang, is situated 23 m. from Bantam
Port in the East, 42 m. from Bantam Bay, and close by is the old
ruin of town of Bantam, once the capital of the kingdom of Bantam,
and before the foundation of Batavia the principal commercial
port of the Dutch East India Company. The ruins include the
remains of the former pepper warehouses, the old factory, called
Fort Speelwijk, belonging to the company, the fortified palace
of the former sultans and a well-preserved mosque thought to
have been built by the third Mahomedan ruler of Bantam about
1562-1576, and containing the tombs of various princes of
Bantam. Before the Dutch conquest Bantam was a powerful
Mahomedan state, whose sovereign extended his conquests in
the neighbouring islands of Borneo and Sumatra. In 1593 the
Dutch expelled the Portuguese and formed their first settlement.
A British factory was established in 1603 and continued to
exist till the staff was expelled in 1662. In 1663 the Dutch
reduced the sultan to vassalage, built the fort of Speelwijk and
monopolized the port, which had previously been free to all
comers; and for more than a century afterwards Bantam was one
of the most important of the Dutch settlements in the East.
In 1811 after Batavia had surrendered to the British, Bantam
soon followed; but it was restored to the Dutch in 1814.
Two years later, however, they removed their chief settlement to
the more elevated station of Serang, or Ceram, 7 m. inland,
in 1817 the ruin of Bantam was hastened by a fire.

For "Bantin" fowls see Poultry.

BANTIN, or BANTING, the native name of the wild ox of Java,
known to the Malays as sapi-utan, and in zoology as Bos (Bibos)
sondaicus. The white patch on the rump distinguishes the
bantin from its ally the gaur (q.v.). Bulls of the typical bantin of
Java and Borneo are, when fully adult, completely black
except for the white rump and legs, but the cows and young are
rufous. In Burma the species is represented by the tsaine, or
rufous, in which the colour of the adult bulls is rufous fawn.
Tame bantin are bred in Bali, near Java, and exported to
Singapore. (See Bovidac.)

BANTY, a seaport, market-town and seaside resort of Co.
Cork, Ireland. In the west parliamentary division, 58 m. S.W.
of Cork by Cork, Bandon & South Coast railway. On the bay
of the same name. Pop. (1901) 3129. It is an important centre
both for sea fisheries and for sport with the rod. It is the term
minus of the railway, and a coaching station on the famous
"Prince of Wales" route (named after King Edward VII.) from
Cork to Glengariff and Killarney. The bay, with excellent
anchorage, is a picturesque inlet some 22 m. long by 3 to 6 broad,
with 12 to 32 fathoms of water. It is one of the headquarter
stations of the Channel Squadron, which uses the harbour at
Castletown Berehaven on the northern shore, behind Bear
Island, near the mouth of the bay. It was the scene of attempts
by the French to invade Ireland in 1689 and 1706, and troops of
William of Orange were landed here in 1697. There are several
islands, the principal of which are Bear Island and Whiddy,
off the town. Ruins of the so-called "fish-palaces" testify to the
failure of the pilchard fishery in the 18th century.

BANTU LANGUAGES. The greater part of Africa south of
the equator possesses but one linguistic family so far as its
native inhabitants are concerned. This clearly-marked division
of human speech has been entitled the Bantu, a name invented
by Dr W. H. I. Bleek, and it is, on the whole, the fittest general
term with which to designate the most remarkable group of
African languages. It must not be supposed for a moment that all the people who
speak Bantu languages belong necessarily to a special and
definite type of negro. On the contrary, though there is a certain
physical resemblance among those tribes who speak clearly-marked Bantu dialects (the Babangi of the upper Congo, the
people of the Great Lakes, the Ova-herero, the Bata-tonga, Zulu-
Kalifs, Awamba and some of the East Coast tribes), there is
nevertheless a great diversity in outward appearance, shape of
head and other physical characteristics, among the negroes who
inhabit Bantu Africa. Some tribes speaking Bantu languages
are of dwarf or dwarfs, and belong to the group of Forest
Pygmies;0 Other Patter Characteristics. There is also a general opinion that Bantu
again cannot be distinguished from the most exaggerated types of
the black West African negro. Yet others again, especially
on the north, are of Galla (Galla) or Nilotic origin. But the
general deduction to be drawn from a study of the Bantu
languages, as they exist at the present day, is that at some
period not more than 3000 years ago a powerful tribe of
negroes speaking the Bantu mother-language, allied physically
to the negroes of the south-western Nile and southern Lake
Chad basins (yet impregnated with the praucasian Hmithe),
pushed themselves forcibly from the very heart of Africa (the
region between the watersheds of the Shari, Congo and western
Nile) into the southern half of the continent, which at that time
was probably sparsely populated except in the north-west, east
and south. The Congo basin and the south-western watershed
of the Nile at the time of the Bantu invasion would have been
occupied on the Atlantic seaboard by West Coast negroes, and
in the centre by negroes of a low type and by Forest Pygmies;
the eastern coasts of Victoria Nyanza and the East African coast
region is the more likely to have been inhabited by Bushmen
tribes, partly Nilotic negro and partly Hottentot-Bushman. From
Lakes Tanganyika and Nyasa south-westwards to the Cape of
Good Hope the population was Forest negro, Nilotic negro,
Hottentot and Bushman. Over nearly all this area the Bantu
swept; and they assimilated or absorbed the vast majority of
the preceding populations, of which, physically or linguistically,
the only survivors are the scattered tribes of pygmies in the
forests of south-west Nile land, Congo basin and Gabun, the
central Sudanese of the N.E. Congo, a few patches of quasi-
Hottentot, Hamitic and Nilotic peoples between Victoria
Nyanza and the Zanzibar coast, and the Bushmen and Hottentots
of south-west Africa. The first area of decided concentration
on the part of the Bantu was very probably Uganda and the
shores of Tanganyika. The main line of advance south-west
travelled rather to the east coast of Africa than to the west,
but bifurcated at the south end of Lake Tanganyika, one great
branch passing west between that lake and Nyasa, and the
other southwards. Finally, when the Bantu had reached the

3 Bantu (literally Ba-ntu) is the most archaic and most wide-
spread term for "men," "mankind," "people," in these languages.
It also indicates aptly the leading feature of this group of
tongues, which are governed by the unchangeable root by prefixes.
The syllable -ntu is nowhere found now standing alone, but it originally
meant "object," or possibly "person." It is also occasionally used
as a relative pronoun— that, which, who. Combined with different
prefixes it has different meanings. Thus (in the purer forms of Bantu
languages) muntu means " a man," bantu means " men," kintu means
" a thing," bintu " things," bantu means "a little thing," buntu " little things," and so on. This term Bantu
has been often criticized, but no one has supplied a better, simpler
designation for this section of Negro languages, and the name has
now been definitely consecrated by usage.
south-west corner of Africa, their farther advance was checked by two causes: first, the concentration in a healthy, cattle-rearing people of Africa of the Hottentots (themselves only a superior type of Bushman, but able to offer a much stronger resistance to the big black Bantu negroes than the crafty but feeble Bushmen), and secondly, the arrival on the scene of the Dutch and British, but for whose final intervention the whole of southern Africa would have been rapidly Bantuized, as far as the imposition of language was concerned.

The theory thus set forth of the origin and progress of the Bantu and the approximate date at which their great southern exodus commenced, is to some extent attributable to the present writer only, and has been traversed at different times by other writers on the same subject. In the nearly total absence of any historical records, the only means of building up Bantu history lies in linguistic research, in the study of existing dialects, of their relative degree of purity, of their connexion one with the other and of the most widely-spread roots common to the majority of the Bantu languages. The present writer, relying on linguistic evidence, fixed the approximate date at which the Bantu negroes left their primal home in the very heart of Africa at not much more than 2000 years ago; and the reason adduced is one in the root common to a large proportion of the Bantu languages extending the domestic fowl—kuku (nkuku, ngoko, nsusu, nguku, nku).

Now the domestic fowl reached Africa first through Egypt, at the time of the Persian occupation—not before 500 to 400 B.C. It would take at that time at least a couple of hundred years before—from people to people and tribe to tribe to up the Nile valley—the fowl, as a domestic bird, reached the equatorial regions of Africa. The Muscovy duck, introduced by the Portuguese from Brazil at the beginning of the 17th century, is spreading itself over Negro Africa at just about the same rate. Yet the Bantu people must have had the domestic fowl well established amongst themselves before they left their original home, because throughout Bantu Africa (with certain exceptions and those not among the purest Bantu tribes) the root expressing the domestic fowl recurs to the one vocable of kuku.

Curiously enough this root kuku resembles to a marked degree several of the Persian words for "fowl," and is no doubt remotely derived from the cry of the bird. Among those Negro races which do not speak Bantu languages, though they may be living in the closest contact of Bantu communities, the root is quite different. The fowl was only introduced into Madagascar, as far as researches go, by the Arabs during the historical period, and is not known by any name similar to the root kuku. Moreover, even if the fowl had been (and there is no record of this fact) introduced from Madagascar on to the east coast of Africa, it would indeed strange if it carried with it to Cameroon, to the White Nile and to Lake Nyami one and the same name. It may, however, be argued that such a thing is possible, that the introduction of the fowl south of the equator need not be in any way coincident with the Bantu invasion, as its name in North Central Africa may have followed it everywhere among the Bantu peoples. But all other cases of introduced plants or animals do not support this idea in the least. The Muscovy duck, for instance, is pretty well distributed throughout Bantu Africa, but it has no common widely-spread name. Even tobacco (though the root "tabs" turns up unexpectedly in remote parts of Africa) assumes totally different designations in different Bantu tribes.

The Bantu, moreover, remained faithful to a great number of roots like "fowl," which referred to animals, plants, implements and abstract concepts known to them in their original home. Thus there are the root-words for ox (hambe, bame, dik, gopt, budu, bsuta, bali, pis (guluha), pigeon (ziba), buffalo (nyali), dog (mbebo), hippopotamus (mbebo, gulu), elephant (jbebo, joko), leopard (ngolo), house (so-da, yumba, ando, dago, dabo), moon (es), sun, sky, and God (juba), water (nadi, ndiba, mabake), lake or river (awo), the numerals, 1, 2, 3, 4, 5, 10 and 100; verbs like fua (to die), ta (to strike, kill), la (da) or lia (di, dia) (to eat). The root-words cited are not a hundredth part of the total number of root words which are practically common to all the spoken dialects of Bantu Africa. Therefore the possession amongst its root-words of a common name for "fowl" seems to the present writer to show conclusively that 1) the original Bantu tribe must have possessed the domestic fowl before its dispersal through the southern half of Africa began, and that 2) as it is historically certain that the fowl as a domestic bird did not reach Egypt before the Persian conquest in 525 B.C., and probably would not have been transmitted to the heart of Africa for another couple of hundred years, the Bantu exodus (at any rate to the south of the equatorial region) may safely be placed at a date not much anterior to 2100 years ago.

The creation of the Bantu type of language (pronoun-prefix) was certainly a much more ancient event than the exodus from the Bantu mother-land. Some form of speech like Fula, Kiama (Tem), or Kposo of northern Togoland, or one of the languages of the lower Niger or Benue, may have been taken up by ancient Libyan, Hamite or Nilotic conquerors and cast into the type which we now know as Bantu—a division of sexless Negro speech, however, that shows no obvious traces of Hamitic (Caucasian) influence. We have no clue at present to the exact birth-place of the Bantu nor to the particular group of dialects or languages from which it sprang. Its origin and near relationships are as much a puzzle as is the case with the Aryan speech. Perhaps in grammatical construction (suffixes taking the place of prefixes) Fula shows some resemblance; and Fula possesses the concord in a form considerably like that of the Bantu, as well as offering affinities in the numerals 3 and 4, and in a few nominal, pronominal and verbal roots. The Timne and Cognate languages of southern Guinea show affinities with the north Guinea coast use pronominal prefixes and a system of cases. It is on the latter that the latter being precisely similar to the same practice in the Bantu languages; but in word-roots (substantives, numerals, pronouns, verbs) there is absolutely no resemblance with this north Guinea group of prefix-using languages. In the numerals 2, 3, 4, and sometimes 5, and in a few verbal roots, there is a distinct affinity between Bantu and the languages of N. Togoland, the Benue river, lower Niger, Calabar and Gold Coast. The same thing may be said with less emphasis about the Madi and possibly the Nyam-Nyam (Makarka) group of languages in Central Africa though in none of these forms of speech is there any trace of the concord. Prefixes of a simple kind are used in the tongues of Ashanti, N. Togoland, lower Niger and eastern Niger delta, Cross River and Benue, to express differences between singular and plural, and also the quality of the noun; but they do not correspond to those of the Bantu type, though they sometimes fall into "classes." In the north-west of the Bantu field, in the region between Cameroon and the north-western basin of the Cameroun or the Benue, there is an area of great extent occupied by languages, the "semi-Bantu" character, such as Nki, Mudukim, Akpa, Mbe, Bayon, Manyاو, Bafut and Banzo, and the Munshi, Jarawa, Kororaha, Kamu and Gbari of the central and western Benue basin. The resemblances to the Bantu in certain word-roots are of an obvious nature; and prefixes in a very simple form are generally used for singular and plural, but the rest of the concord is very doubtful. Here, however, we have the nearest relations of the Bantu, so far as
etymology of word-roots is concerned. Further evidence of slight etymological and even grammatical relationships may be traced as far west as the lower Niger and northern and western Gold Coast languages (and, in some word-roots, the Mandingo group). The Fula language would offer some grammatical resemblance if its suffixes were turned into prefixes (a change which has actually taken place in the reverse direction in the English language between its former Teutonic and its modern Romanized condition; cf. "offset" and "set-off," "standing-up" and "standing-down").

The legends and traditions of the Bantu peoples themselves invariably point to a northern origin, and a period, not wholly removed from their racial remembrance, when they were strangers in their present lands. Seemingly the Bantu, somewhat early in their migration down the coast, took to the sea, and not merely occupied the islands of Pemba and Zanzibar, but travelled as far afield as the Comoro archipelago and even the west coast of Madagascar. Their invasion of Madagascar must have been fairly considerable in numbers, and they doubtless gave rise to the race of black people known traditionally to the Hovas as the Va-zimba.

The accompanying map will show pretty accurately the distribution of the Bantu-speaking Negroes at the present day.

**BANTU LANGUAGES**

**Classification.—**With our present knowledge of the existing Bantu tongues and their affinities, it is possible to divide them approximately into the following numbered groups and subdivisions, commencing at the north-eastern extremity of the Bantu domain, where, on the whole, the languages approximate nearest to the hypothetical parent stock.

(1) The Uaganda-Unyoro group. This includes all the dialects between the Victoria Nile and Busoga on the east and north, the east coast of Lake Albert, the range of Ruwenzori and the Congo Forest, and the south-western coast and the north-east of the Victoria Nyanza, and a line from near Emin Pasha Gulf to the Malagarazi river and the east coast of Tanganyika. On the south-west this district is bounded more or less by the Rusizi river which forms the boundary of these languages on the north-east and all the archipelagos and inhabited islands of the Victoria Nyanza even as far east as Bukere, except those islands near the north-east coast. The dialects of Busoga, the Sese Islands and the west coast of Lake Victoria are closely related to the languages of eastern Tanganyika down to Ufipa are closely allied to the Uonyoro sub-section, is that which is usually classified as Uonyoro.

(2) The Luhuku-Kuamba group, the separate and somewhat peculiar Bantu dialects lingering in the lands to the south and south-west of Albert Nyanza (Mboga country), Luhuk (or Libvanuma) is a very isolated type of Bantu, quite apart from the Uganda-Unyoro group, with which it shares a special affinity at all, though in close juxtaposition. Its alliance with Kuamba of western Ruwenzori is not very close. Other affinities are with the degraded Bantu dialects (Ki-bira, &c.) of the Ituri-Aruwimi forests. Kuamba is spoken on the west and north slopes of the Ruwenzori, and Luhuk on the Lango river, in the northwestern archipelago of the Victoria Nyanza (Igiizi).

(3) The Kikuyu-Kamba group, embracing the languages of the Kikuyu, Luvungi, Luvungu and Luvu, of the north-eastern and eastern shores of the Victoria Nyanza and the northern Kivu and Mount Elgon territories, is related to the Luganda section more than to any group of the Bantu tongues, but it is a very different linguistic division, in its prefixes it contains the languages spoken along the western flanks of Mount Elgon, those of Bantu Kivuondo, and of the eastern coast-lands of the Victoria Nyanza (Igizhi).

(4) The Ki-kikuyu-Kamba group of British East Africa, east of the Rift-valley. It includes besides the special dialects of Kikuyu and Ukumbani, all the scattered fragments of Bantu speech on Mount Kenya and the upper Tana river (Dhaicio).

(5) The Kikuyu-Kamba group, embracing the rather peculiar dialects of Mount Kilimanjaro, Luvungi and Luvu.

(6) The Pokomo-Nyika-Giriana-Tatevi group represents the Bantu dialects of the coast province of British East Africa, between (and including) the Tana river on the north and the frontier of German East Africa on the south.

(7) Swahili, the language of Zanzibar and of the opposite coast, a form of speech now widely spread as a commercial language over Eastern and Central Africa. Swahili is a somewhat archaic Bantu dialect, indigenous probably to the East African coast south of the Pwani, and of the coast-lands of the north and north-eastern coast of the mainland. It may have been a broken Bantu group mingled with strangers among the people of Mombasa, Malindi, Lamu, and even as far north as the Sheli or Somallia, and also along the coast of the German and Portuguese East Africa as far south as Angoche. In the coast-lands to the north of Lake Tanganyika, the north and the Kilwa settlements on the south, the local languages and dialects are more or less related to Swahili, though they are independent languages. Among these may be mentioned Bondeti, Shambala (north of the Ruvu), Nyuru,-Zagaha, Ki-mirimba and Ki-zaramba.

(8) The Enkuguru-Sagale-Kami group, which occupies the inland territories of German East Africa, between the Swahili coast dialects on the east and the domain of the Nyamwezi (No. 11) on the west. On the north this group is bounded by the non-Bantu languages of the Masai, Muyuru, and Karamojong, and on the south by the Ruhuna river. This group includes Kigogo and Irangi.

---

1 In using the forms Uaganda, Unyoro, the writer accepts the popular mis-spelling. These countries should be called Buganda and Bunyoro, and their languages Luganda and Runyoro.
(9) The dialects of the Comoro Islands, between the East African coast and Madagascar, are styled Hi-neu or Anzoumi and Shi-nganja. They are somewhat closely related to Swahili.

(10) The archaic Makonde or Makbio of the lower Kuvuma, and the coast between Lindi and Ilbo; this might conceivably be attached to the Swahili branch.

(11) The Nyamwezi group includes all the dialects of the Nyamwezi country west of Ugo as far north as the Victoria Nyanza (where it is joined, northwards, by the Bantu tongues of the Kasai rivers). This language may be connected with that of the Djagbe, or, more probably, that of the Bantu, we meet with another group, the Mpongwe-Orungu and Aduma languages of French Gabun, and the tongues of the Lower Ogowe and Fernan Vaz promontory.

(12) The Tanganyika languages (Ki-rape, Kabwezi, Kikuba, &c.) These are spoken generally by the districts west-north-west, and perhaps north and east of Tanganyika, from the vicinity of Lake Albert Edward on the north and the Lukuga outlet of Tanganyika on the south. On the west they are bounded by the Congo Forest and the Manyesa genus (Nos. 13), the east coast of Tanganyika (Kiri-rundi, Kiinye, &c.) seem to be more nearly connected with those of group No. 1 (Uganda-Unyoro), yet perhaps they are more conveniently included here.

(13) The Manyesa (Baunya) group includes most of the corrupt Bantu dialects between the western watershed of Tanganyika and the main stream of the Luapula-Congo, extending also still farther north, and comprising (seemingly) the languages of the Aruwimi basin, the Kivira dialects of Kasai, the Bondu, Londu, &c. On the west the Manyesa group is bounded by the languages of the Lomami valley, which belong to groups Nos. 15 and 16; on the east the Manyesa genus merges into the much purer Bantu dialects of group No. 1. An extensive and important branch (the northern section) No. 2) shows these tongues to be connected with the Manyesa group. The Kivira dialects of the north-eastern Congo Forest (Ituri district) may perhaps be placed in this section.

(14) The Manyesa-Mambo dialects, generally spoken in the north of the southmost parts of the Congo, in the vicinity of the Kanyoka, Bantu basin (where discovered that the north coast line of the Congo, the main stream of the Congo and the Kasai-Kasai and Upper Kwilu on the west. Its boundary on the north is perhaps the Sankuru river.

(15) The Balolo group consists of all the languages of the Northern Congo, and may be divided into four general divisions: the Balolo, of the main stream of the Congo, and perhaps the corrupt dialects of the Northern Kasai, Kwilu and Kwango (Babuna, Babuana, Bambala, Ba-yaka, Babula, &c.), where these are not nearer allied to Teke (No. 30) than to Balolo (No. 29).

(16) The Bangala-Bobangi-Liloko group comprises the commercial languages of the Upper Congo (Ngala, Bangi, Liloko, Fatu, Ngombe, Yanzi, &c.) and all the known Congo dialects along to and north of the mouth of the Kongo (partly included in the Balolo group). On the main junction of the Sangha to as far east as the Rubi and Lomami rivers, and those between the Congo and the Lower Ubangi river and up the Ubangi, as far north as the limits of the Bantu domain (about 3° 30' N. lat.), are the only forms of speech in the basin of the Sangha river, besides the "Ba-yanzi" dialects of Lakes Mantumbe and Leopold II.

(17) The Bake (Batto) group. This may be taken roughly to include most of the Bantu dialects west of the Sangha river, north-west of the Lower Congo, south of the Upper Ogowe and Ngoko rivers and east of the Atlantic coast-lands.

(18) The Di-Kele and Benga dialects of Spanish Guinea and the Bantu dialects of Camayam ataumbo.

(19) The Fali or Fang languages of forms of speech (so corrupt as to be just recognizable as Bantu), which occupy the little-known interior of German Cameroon and French Gabun, down to the Ogowe, and as far north as the mouth of the Kongo, and include the intermediate hinterland of the "Duala" Cameroon.

(20) The Duala group, which on the other hand is of a much purer Bantu type, includes the languages spoken on the estuary of the Ogowe, and extending into the old-time Spanish Congo.

(21) The Isulu-Bakwiri group of the coast-lands north of Cameroon delta (Ambas Bay), and on the west slopes of Cameroon Mts.

(22) The Isinu-Bakwiri group of the coast-lands north of Cameroon delta (Ambas Bay), and on the west slopes of Cameroon Mts.

(23) The Bantu dialects of Fernando Pó (Ediya, Bateti, Bani, &c.) distantly allied to Nos. 24, 2 and 13.

(24) The Barongo-Bakundu group, which begins on the north at the Kio-del Rey on the extremity of the Bantu field, near the estuary of the Arous river, and also at the mouth of the Dibango and Wamanga languages, are allied to the Mbangi-Mompi of the Turi and Ngoko, and also to the Munda of the Egyptian Sudan. The Munda group extends westward to the upper Ubangi, as far south as 3° 30' N. See George Gorrell and the Congo, by Sir Harry Johnston; and Dans la Grande Foret de l'Afrique Equatoriale, by Franz Thonner (1899).

It is an important and recently discovered fact (delineated in the work of the Baptist missionaries and of the Austrian traveller Dr. Franz Thonner) that the Congo at its northern and north-eastern bend, between the Rubi river and Stanley Falls, lies outside the Bantu field. The Bondonga and Wamanga languages are not Bantu. They belong to the languages of the Nyasa-Tanganyika plateau and also to the Munda of the Egyptian Sudan. The Mundu group extends westward to the upper Ubangi, as far south as 30° N. See George Gorrell and the Congo, by Sir Harry Johnston; and Dans la Grande Forêt de l'Afrique Equatoriale, by Franz Thonner (1899).

(25) What may be called the North Nyasa or Nkonde group comprises all the dialects of the north-west and north coasts of Lake Nyasa and to the north of the Ici-wandia river, and also southwards to the Lower Kuvuma river, beyond the Nyasa-Tanganyika plateau, and extends perhaps as far north west as the Fipa country (Iki-fipa), and the shores of Lake Rukwa (Icierungu) in the vicinity of the Nyamwezi domain (No. 11). Iki-fipa, however, has some affinities to the Tanganyika and western Victoria-Nyanza languages (groups Nos. 1 and 12).
(36) The western part of Nyasaland, south of group No. 35, is occupied by the Tumbuka section, which includes the languages of the Tumbuka, Henga and A-tongo peoples, and occupies the area between the western shores of Lake Nyasa and the Upper Luangwa river.

(37) Eastwards of No. 35 (North Nyasa group) lies the Kinga speech of the lofty Livingstone mountains, which is sufficiently distinct from its neighbours to be classified as a separate group.

(38) The northern group of the Livingstone mountains and west of the Ruvuma river, south also of the Umyamwezi domain, extends the Sango-Bena-Uche-Suvi group.

(39) The extensive Yao genus of languages stretches from just behind the coast of the Lindi shelf to the far north of the Zambian Copperbelt; (k) south-west across the Ruvuma river to the north-east shores of Lake Nyasa (Ki-kese), and thence back to the valley of the Lujendza-Ruvuma (Cingindo), and southwards in various dialects of the Yao language to the south-east corner of Lake Nyasa and the regions of the Songa and Shire rivers. In the basin of the Shire, between the Chipeta and Chipeta, lands and Mt. Manjane. It is only since the middle of the 19th century that the Yao language has conquered territory to the south of Lake Nyasa. There still remain within its domain colonies of Nyanja-speaking people.

(40) Eastwards of the Yao domain, and bounded on the north by the range of that language in the Ruvuma valley and by the separate group of Ki-makonde (No. 10), ranges the well-marked Makonde domain, which includes the group of the Makonde, a tribe of Portuguese East Africa away from the watershed of Lake Nyasa. The Makonde language is probably divided into the following dialects:—I-melo, I-tomwe, I-tugula and Anzura. There are other dialects understood by the people there, but they are not necessarily distinct.

(41) The southern part of the Makonde domain is occupied by the Ci-gwamba of the Quelimane district.

(42) Nyanga, perhaps the most extensive group of cognate languages in the Bantu field, is principally associated with the east and west shores of the southern half of Lake Nyasa. It also covers all the valley of the Shire, except portions of the Shire highlands, domed by the highlands of the North Shire and Zambezi. The lands on both banks of the Zambezi down to and including its delta. West of Lake Nyasa, the Nyanga domain extends in the Senga language to the river Luangwa and the Central Zambezi, also along both banks of the Shire and other central rivers of the country. All the Nyanga dialects are spoken as far west as the Victoria Falls. Thence they extend eastwards over Moshanaland to the seacoast. With this family may also be associated the languages of the Portuguese coast region south of the Zambezi as far as Inhambane. The principal dialects of the Nyanga language are the Ci-ngwa of Eastern Nyasaland, Ci-peta and Ci-maumor of South-West Nyasaland to as far as the watershed of the Luangwa river, the Ci-maumor of the Shire highlands, Ci-melo and Ci-machiri of the Shire river, Ci-macandwe of the Tete and Sena (Zambezi), andCi-maumor of the Lower Zambezi.

(43) The north-eastern group of Nyasa Lake, known as the Bechuanaland protectorate west of the Guai river. Bechuanaland dialects (such as Ci-venda, Se-suto, Se-poló, Se-kalala, Se-xápi, &c.) covers three groups of languages in the north and south respectively. The Bechuanaland or No. 41, covers an area almost as great as the Bechuanaland protectorate. The languages of this group are divided into three groups:

(44) The Ronga (Tonga) languages of Portuguese South-East Africa (Gazaland, Lower Limpopo valley, and patches of the North Transvaal (Shi-gwamba), Delagoa Bay) are almost equally related to the Nyanga group (41) on the one hand, and to Zulu on the other, probably presenting a mingling of the two influences, of which the latter predominates.

(45) The last comes the Zulu-Khoi group, occupying parts of Rhodesia, the eastern portion of the Transvaal, Swaziland, Natal and the eastern coastal strip of Africa south of Lake Malawi. It is divided into various dialects in phonetics, the Zulu language (divided at most into three dialects) is related in some phonetic features to No. 42, and of course to No. 43; otherwise it stands very much alone in its developments. It may have distant relations in groups Nos. 23 and 41, and the dialect of Zulu (Tebele and Ki-wongi or Ci-rongo) are spoken at the present day in South-West Rhodesia and in Western Nyasaland and on the plateaus north-east of Lake Nyasa, carried thither by the Zuludrivers of the early 19th century.

The foregoing is only an attempt to classify the known forms of Bantu speech and to give their approximate geographical limits. The attempt is not as well as it might be in view of the fact that languages spoken by two or three villages which, though emphatically Bantu, possess isolated characters making them not easily included within any of the above-mentioned groups; but too detailed a classification would only lead to confusion, perhaps in the end perhaps puzzling. Broadly speaking, the domain of Bantu speech seems to be divided into four great sections:—(a) the languages of the Great Lakes and the East Coast down to and including the source of the Zambezi; (b) the languages of the Shire and the Zambesi (Shi-gwamba); (c) the languages of the South-West, from the southern part of the Belgian Congo to Damarama and the Angola-Congo coast; and (d) the Western group, including all the Central and Northern Congo and Cameroun languages, and probably also group No. 2 of the South-East.

Common Features.—There is no mistaking a Bantu language, which perhaps is what renders the study of this group so interesting and encouraging. The homogeneity of this family is so striking, as compared with the inexplicable confusion of tongues which reigns in Africa north of the Bantu borderland, that the close relationships of these dialects have perhaps been a little exaggerated by earlier writers.

The phonology of the Western group (d) is akin to that of the Negro languages of Western and West-Central Africa. A small portion of (b) the South-Central group (Zulu) has picked up clicks, perhaps borrowed from the Hottentots and Bushmen. Otherwise, the three groups (a), (b) and (c) are closely related in phonology, and never, except here and there on the borders of Western languages, are they divided into causes or affixes which may be applied in conjugating verbs, and the roots of some prepositions.

1 These features are characteristic of almost all the Negro languages of Africa.

2 This does not preclude the aspiration of consonants, or the occurrence of local changes of a palatal into a guttural.

3 As already mentioned, a somewhat similar concord is also present as regards the suffixes of the Fula and the Kiamo (Terem) languages in Western Africa, and as regards the prefixes of the Umdjulo (San) of South Africa.

4 An apparent but not real exception to this rule is in the second person plural of the imperative mood, where an abbreviated form of the verb is prefixed to the noun. Other phases of the verb may be occasionally emphasized by the repetition of the governing pronoun at the end.
The root of the verb is the second person singular of the imperative.
(6) No sexual gender is recognized in the pronouns and concord. Sexual gender may be indicated by a male "prefix" of varying forms, often identical with a word meaning "father," while there is a feminine prefix, na or nja, connected with the root meaning "mother," or a suffix ka or kiki, indicating "wife," "female.

The sixteenth original prefixes of the Bantu languages are given below in the most original forms to be found at the present time. The still older types of these prefixes met in one or two languages, and dedicated general names are sometimes other forms of the particle used in the syntax, are given in brackets. It is possible that some of these prefixes resulted from the combination of a demonstrative pronoun and a prefix indicating quality or number.

**Old Bantu Prefixes.**

**Class 1.**

Plural.

1. Umu (Mwen-mu). 2. Aba (Mnu-ba or Ngu-ba).

4. *Imi* (Ngi-mi).

5. *Idi* (Ndi-idi).

6. Ama (Ngam-ma).

7. Ki-ke (Khi-ki).

8. Mbu (Mbi-bi).

9. Lura or Luma (Lum-ki).

10. Lika or Liku (Lik-ki).

13. *Abu* (Nka-ka); usually diminutives, sometimes functions.

14. *Ubu* (Mka-bu); sometimes used in a plural sense; generally employed to indicate abstract nouns.

15. *Uku* (Nku-ku); identical with the preposition "to," used in parallel with verbs, but also with certain nouns indicating primarily functions of the body.

**Class 2.**

Locative; to nouns and other forms of speech; never in place or position; identical with the adverb "here," as ku is with "there."

To these sixteen prefixes, the use which is practically common to all members of the family, might perhaps be called No. 1, Tse, Tse, or Vi-, a prefix in the singular number, having a diminutive sense, which is found in various of the western and north-western tongues, chiefly in the northern half of the Congo basin and the upper Congo river. Thus, e.g., in the Manyena language of the Upper Congo river Tanganika, this prefix cannot be traced to derivation from any of the others, though the origin is not known. The corresponding plural prefix is *Kwe* (Kwe), Tse-ba, Ogu, which has, as a plural prefix, No. 19, Aga. These are both used in an augmentative sense, and their use seems to be confined to the Luganda and Masaba dialects, and perhaps some branches of the Unyoro language. These, like No. 17, are regular prefixes, since they sometimes occur in the plural. Like No. 17, the 20th prefix, *Mu*, which is really a preposition meaning "in," or "into," often combined in meaning with another particle, or suffix, usually used as a suffix. This prefix, or *Mu*, however, does not seem to have a close connexion with the usual or as a preposition and has no grammatical accusative.

The concord may be explained thus: Let us for a moment reconstruct the original Bantu mother-tongue as attempts are sometimes made to do, and observe that the three or four commonest roots of any language are those of the most archaic of its daughters, and that all other types may be explained from these.

**Bantu Languages.**

Babo mbaba-ntu

mbaba-ntu

babi ba-bo-za ba-za-oga.

They see-they person they bad who kill we fear them.

Babo babba-ni babba tu-ba-enga.

They see-they person they bad who we kill them fear.

Babo abana-tu abana to-ba-tia.

(These are beautiful people, we hate them.)

Old Bantu.

Ngomu mu-lo-nta mu-lo-nta.

Babo nga-ba-nta nga-ba-nta.

Babo nga-ba-nta nga-ba-nta.

This prefix and its corresponding particle have varied greatly in form from the original syllables, as the various Bantu dialects became more and more corrupt. Assuming these prefixes to have consisted of two distinct particles, such as, for example, Nos. 1 and 3, 

1. The full hypothetical forms of the prefixes as joined with definite articles—Ngum, Mbwaba, Ngem, Nsama and so on—are added in brackets. Forms very like these are met with in the Mt. Elgon languages (Group No. 3) and in Sibaya group (No. 32).

2. Or perhaps *nga-ba-nta* (afterwards *ga-ba*, *aba*); the form *gaba* is actually met with in Zulu-Kaffir: also *gnama*.

3. Likewise *ba* may have meant "two" ("Bantu root *tali* = two"); a dual first and then a plural.

land from which the Bantu negroes were subsequently driven by Nilotic invaders from the north. They may be relics therefore of a time before the Pa- prefix of those regions had changed to the modern form of Ha-. In S.W. and N.W. Cameroon the initial p of their usual meanings are as follows: in English, in North-West Bantu Africa and in the whole basin of the Congo, except the extreme south and south-east, the form Pa- is never met with; it is Ya-, Wa-, Ha-, Pa-, or A-.

In the Secuanova group of dialects it is Pa or Ha-; in the Lengi language of Baronial land it resembles the very rare form of Ba-, while the first prefix is weakened to A-

The pronouns in Bantu are in most cases traceable to some such general forms as these:

I, me, my
Thou, thee, thine
He or she, him, her, his, &c

-a, -ya,-wo-(nom.); also -igu-(which becomes ya, ye, wu, hu, igu, nu, -kuw-(poss.); there is also another form, ndi (nom. and poss) in the Western Bantu languages, e.g. We, us, our

Ye, you, your

mu, mu-nyu, nyr, -ni

(tanda-ile, -ilevo, -ile, -ile, -ilevo, -ile, etc.)

They, them, their

-babo, ba-ba; -ba-(acc.); -babo, ba-ba;

The Bantu verb consists of a pronominal, invariable root which is employed as the second person singular of the imperative. To this root are prefixed and suffixed various particles. These are worn-down verbs which have become auxiliaries or are reduced to a formless (with a particle or particles) state. It is probable that the building up of the verbal root into moods and tenses has taken place independently in the principal groups of Bantu languages, the arrangement followed being probably founded on a fundamental system. Among the original forms of the verbal root, there were the exceptions allowed to be a method of forming the preterite tense, which seems to be shared by a great number of widely-spread Bantu languages. This may be illustrated by the Zulu tanda, love, which changes to tandile, to love, and so on, in all the other forms -tani, -tani, -tana, etc., and is always referable back to some form like di or ile, which is probably connected with the root di or di (ndi or ni), which means "to be" or "to exist." The initial i in the particle or phoneme affects the last penultiminate syllable of the root, thereby causing one of the very rare changes which take place in the vocabulary. In many Bantu dialects the root pa (which means to give) becomes pedi in the preterite (no doubt from an original pa-ile). Likewise the Zulu tandile is a contraction of tandile, tanda, with the addition of a particle or phoneme. The exceptions from this rule are so rare that they might almost be included among the elementary propositions determining the Bantu languages. And these instances when they occur are generally due to a direct or indirect borrowing of foreign words (Arabic, Portuguese or English). This point of the root a is the more interesting because, by changing the terminal vowel of the verbal root and possibly adding a personal prefix, one can make nouns from verbs. Thus in Luganda, the verb root for "pardon" or "forgiveness" is ki-senyu. A "pardoner" might be mu-senyu. In Swahili, patanisa would be the verbal root for "convict"; mpatanasi is a "convictor," and upatana is a "convict." Another marked feature of the verb is that of modifying the sense of the original verbal root by suffixes, the affixion of which modifies the sense of the verbal root and sometimes the preceding consonant of the root. The most important variations in these languages understandable as a case of verbal root.

Supposing an original Bantu root tandla, to love; this may become tandwa, to laugh: this becomes tandaka or tandibia, to laugh;
tandika or tandila, to laugh;
tandia or -tanda, to laugh;
tandis (or -tanda) to cause to laugh;
tandis (or -tanda) to be laughed at;
tandona to love reciprocally.

The suffix -aka or -aga sometimes appears and gives a sense of continuation to the verbal root. Thus tanda may become tandaka in the sense of "to continue loving.

The negative verbal particle in all Bantu languages may be traced back to the root (a) Sa, koi, it is so in the Zulu and Shona, and in other tongues. Apparently in the parent language this particle had already these alternative forms, which resemble those in some West African languages. In the vast majority of the Bantu dialects at the present day, the negative particle in the verb (which nearly always coalesces with the pronominal particle) is descended from the kafa, sa, or koi, ti or ti, or sa, or sa, or sa, it, is, he, and, it is only by the existence of some intermediate forms (as in the Kongo language) that we are able to guess at the original separation between the two. Originally the negative particle kia, sa, etc., was joined to the pronominal particles, thus: kia-

ka-ku or ka-ku-
ka-a, sa-
ka-tu
ka-mu
ka-bo (or sa-
not I)
not thou.
k-a, sa-
not he, she, it
not she.
not they.

In like manner sa would become sa-ngi, sa-ngi, &c. But very early in the history of Bantu languages ka-ngi, or sa-ngi, became contracted to the form kia, sa, as is also the case with the Kikongo, in Chokwe, and it seems that kia, kis, has never been used. Sometimes in the modern languages the negative particle (such as it or sa) is used without any vestige of a pronoun being attached to it, and is applied indifferently to all the persons referred to in the sentence. Thus the negative of the verb is expressed (1) by stress or accent; (2) by suffix (traceable to a root -pe or -bo) answering to the French pas, and having the same sense; and (3) by the separate employment of an adverb. In fact, if a few Bantu languages, the verb used in a negative sense may be formed by changing the terminal -a to -e, then tandia=love, tandis=may love.

BIBLIOGRAPHY—A Comparative Grammar of South African Languages (in two parts, left unfinished), by Dr H. W. Blom (London, 1869); A Sketch of the Modern Languages of Africa, by R. N. Cusin (1882); Comparative Grammar of the South African Bantu Languages, by Father J. Torrend (1864); mainly composed on a study of the languages of the Coloured Africans, interesting, but is not without some deductions, and incomplete. In Sir H. H. Johnston's The Kilimanjaro Expedition (1884), British Central Africa (1898), and The Uganad Exploration (1902-1904), there are illustrative vocabularies; and C. C. Neuberg and the Congo (1891) are freely formed in the manner of the tanda=to love; tandis=may love.

In the numerous essays of Carl Meinhof on the original structure of the Bantu mother-speech, and on existing languages in Eastern Africa, he has developed a progressive view of the formation of the modern Kikongo and Chokwe languages.

The Swahili-English Dictionary, by Dr. L. Krapi (London, 1882), contains a mass of not well-ordered or invaluable information concerning the Swahili language spoken on the coast of East Africa, especially regarding many words now becoming obsolete. A similar mine of information is to be found in an Encyclopaedic Dictionary of the Manafi language (Mang' anja) Language of British Central Africa, by the Rev. C. C. Neuberg (London, 1892). Other admirable works are the Dictionary of the Congo Language, by the Rev. Holman Bentley (1891), and The Folklore of Angola, and a Grammar of the Kikumbu, by Dr. Heli Chatelein, the many handbooks and vocabularies written and published by Bentley and others, and the earlier works of the East African Linguistic Institute. All of these forms of the prefixes now passing out of use. The Introductory Handbook of the Yao Language, by the Rev. Alexander Hetherwick, illustrates very fully the peculiar and important character of the East African Bantu languages of the Western Congo basin, under the editorship of Dr. A. Sims: more important works on this subject have been published by the Rev. W. H. Stapleton (Comparative Handbook of Congo Languages), and by Rev. John Whitehead (Grammar and Dictionary of the Eastern, 1899). Hetherwick has illustrated the languages of the Western Congo basin (Kwango, Kwilu, northern Kasai) in the Journal of the Royal Anthropological Institute. There is a treatise on the Lunda language of the south-western part of the lord mbo, mbo (or Lunda), by Henrique de Carvalho, who also in his Ethnographia de Especladu portuguesa.

1 Mi is a possible softening of mi, ri; ligi becomes in some dialects nji, ndi, or mi; there is in some of the coast Cameroon languages, and in the north-eastern part of the Congo, the word ligi, which seems to be borrowed from the Sudanese Mundu tongues.

2 The possessive pronoun for the first person is derived from two forms, am and angi (am, angi, anni, ambi, &c.).

3 An exception to this rule is the verbal particle li or di, which means "to be." 4 Or-ero, -era.

5 This form may appear also as sa, as. for instance akata to be on fire becomes asa, to set on fire.
As Musa Yano goes deeply into Bantu language questions. The Duala language of Cameroon has been illustrated by the Baptist missionary Saker in his works published about 1860, and since 1890 by German missionaries and explorers (such as Schaper). The Duala was finally published in 1890 in Matthias' "Schriften für orientalische Sprachen" (Berlin); see also Schaper's "Grammatik des Duala." The Rev. S. Koele, in his "Polyglotta Africana," published in 1851, gave a good many interesting vocabularies of the Duala and some other Bantu languages of Nigeria and the Congo, particularly those of "Mambila" and "Kanu" (Usurra). The fullest information is now extant regarding the languages of Uso and Unyoro, in works by the missionaries of the Church Missionary Society (Fulkington, Blackledge, Hattersley, Hulme), and of the "Nama" (H. M. Ivens, later at the Kaffir). The mission, has collected information regarding the Masaka dialects of Elgon, and some of these have also been illustrated by Mr. C. W. Hobi, and by Sir H. H. Johnston ("Uganda Protectorate"), and privately by Mr. S. A. Northcote. Mr. A. C. Madan has published works on the Indian languages of the little-known Seng of Central Zambezia and Wisa of North-East Rhodesia (University Press, Jacquetet, Paris, 1932) and his "Grammaire Subia" provided a valuable study of the Subia and the Ewak languages of Tanganyika. Mr. S. W. H. Northcote (1932) and Mr. E. V. P. H. Northcote have also published a "Dictionary of Krunni" (the language spoken at the north end of Tanganyika). "Och-herero" of Damara land has been illustrated by German writers, old and new; such as Dutsch (1850), W. D. [L.] (1873), and R. [L.] (1879), and the later publications of the German and French have been studied by members of the American Mission at Lulandu under the name of "Umbundu." Some information on the languages of the south-western part of the Congo basin and the "Zambezi" dialects ("J. E. and F. D. Koelle, 1851") of the Shona have been studied by Henri de Carvalho and Commander V. L. Cameron. The British, French and German missionaries have published many dictionaries and grammars of the different Secanu dialects, as well as that of the Kafir and its dialects, which should also be consulted. Miss A. Werner has written important studies on the Zulu click-words and other grammatical essays and vocabularies of the Bantu languages in the "Journal of the African Society" between 1892 and 1886. The Tebete dialect of Zulu has been illustrated by W. A. Elliott in his "Dictionary of the Tebete and Shona languages" (London, 1897). The "Kongo" (Tonga, Si-gwamba, Hlengwe, &c.) are dealt with in his "Grammaire Kongo" (Kasavanne, 1898). Mr. H. Junod, Bishop of Boyce and Bishop Colenso, has published a vocabulary and short grammar of the Xilungo (Shilongo) language of Inshambane (S.P.C.K., 1902). The journal "Anthropos" (Vienna) should also be consulted.

BANVILLE, Théodore Paulin de (1823-1891), French poet and miscellaneous writer, was born at Moulins in the Bourbonnais on the 14th of March 1823. He was the son of a captain in the French navy. His boyhood, by his own account, was cheerlessly passed at a lycée in Paris; he was not harshly treated, but took part in the amusements of his companions. On leaving school with but slender means of support, he devoted himself to journalism, and the first work which appeared under his name was "Les Caricatures" (1846), which was followed by "Les Stalactites" in 1846. The poems encountered some adverse criticism, but secured for their author the approbation and friendship of Alfred de Vigny and Jules Janin. Henceforward Banville's life was devoted to literary production and criticism. He printed other volumes of verse, among which the "Odes funambulesques" (Alençon, 1857) received untinted praise from Victor Hugo, to whom they were dedicated. Later, several of his comedies in verse were produced at the Théâtre Français and on other stages; and from 1853 onwards a stream of prose flowed from his industrious pen, including studies of Parisian manners, sketches of well-known persons ("Comtes parisiennes," &c.), and a series of tales ("Contes bourgeois," "Contes héroïques," &c.), most of which were republished in his collected works (1875-1878). He also wrote freely for reviews, and acted as dramatic critic for more than one newspaper. Throughout a life spent mainly in Paris, Banville's genial character and cultivated mind won him the friendship of the chief men of letters of his time. He was also intimate with Frédéric-Lemaitre and other famous authors. In 1838 he was decorated with the Legion of Honour, and was promoted to be an officer of the order in 1886. He died in Paris on the 13th of March 1891, having just completed his sixty-eighth year. Banville's claim to remembrance rests mainly on his poetry. His plays are written with distinction and refinement, but are deficient in dramatic power; his stories, though marked by fertility of invention, are as a rule conventional and unreal. Most of his prose, indeed, in substance if not in manner, is that of a journalist. His lyrics, however, rank high. A careful and loving student of the finest models, he did even more than his greater and somewhat older comrades, Victor Hugo, Alfred de Musset and Théophile Gautier, to free French poetry from the fetters of metre and mannerism in which it had limped from the days of Malherbe. In the "Odes funambulesques" and elsewhere he revives with perfect grace and understanding the rondeau and the villanelle, and like Victor Hugo in "Les Orientales," wrote "panoramis" (pantuns) after the Malay fashion. He published in 1872 a "L' Étude de versification française" in exposition of his metrical methods. He was a master of delicate satire, and used with much effect the difficult humour of sheer bathos, happily adapted by him from some of the early folk-songs. He has somewhat rashly been compared to Heine, whom he profoundly admired; but if he lacked the supreme touch of genius, he remains a delightful writer, who exercised a wise and sound influence upon the art of his generation.

Among his other works may be mentioned the poems, "Idylles proisiennes" (1871), and "Trente-six ballades joyeuses" (1873); the prose tales, "Les Saltimbanks" (1853); "Eguisses parisiennes" (1859); and "Contes féroiques;" and the plays, "Le Recueillet d'Aristophane" (1852), "Gringoire" (1860), and Desdemona (1870).

BAPTISM.

That as before.

Beforehand, that initiated per lavacrum, "through a font," and that in the Ludi Apollinares et Eleusini, i.e. the mysteries of Apollo and Eleusis, men were baptized (linguntur, Tertullian's favourite word for baptism), and, what is more, baptized, as they presumed to think, "unto regeneration and exemption from the guilt of their perjuries." "Among the ancients," he adds, "anyone who had stained himself with homicide went in search of waters that could purge him of his guilt."

The texts of the New Testament relating to Christian baptism, given roughly in chronological order, are the following:

A.D. 55-60, Rom. vi. 3, 4; 1 Cor. ii. 12-17, vi. 11, x. 1-4; xii. 13, xv. 29; Gal. iii. 27.

A.D. 60-65, Col. ii. 11, 12; Eph. iv. 5, v. 26.

A.D. 60-70, Mark x. 38, 39.

A.D. 80-90, Acts i. 5, ii. 38-41, viii. 16, 17, x. 44-48, xii. 1, xii. 16; 1 Pet. iii. 20, 21; Heb. x. 22.

A.D. 90-100, John iii. 3-8, vii. 22, vii. 26, iv. 1, 2.

Uncertain, Matt. xxviii. 18-20; Mark xvi. 16.

The baptism of John is mentioned in the following:

A.D. 60-70, Mark i. 1-11.

A.D. 80-90, Matt. iii. 1-16; Luke iii. 1-22, vii. 29, 30; Acts i. 22, x. 37, xii. 24, xvi. 25, xix. 3, 4.

A.D. 90-100, John i. 25-33, iii. 23, x. 40.

It is best to defer the question of the origin of Christian baptism until the history of the rite in the centuries which followed has been sketched, for we know more clearly what baptism became after the year 100 than what it was before. And that method on which a great scholar1 insisted when studying the old Persian religion is doubly to be insisted on in the study of the history of baptism and the cognate institution, the eucharist, namely, to avoid equally "the narrowness of mind which clings to matters of fact without rising to their cause and connecting them with the series of associated phenomena, and the wild and uncontrolled spirit of comparison, which, by comparing everything, confounds everything."

Our earliest detailed accounts of baptism are in the Teaching of the Apostles (c.90-120) and in Justin Martyr.

The Teaching has the following:

1. Now concerning baptism, thus baptize ye: having spoken beforehand all these things, baptize into the name of the Father and of the Son and of the Holy Spirit, in living water.
2. But if thou hast not living water, baptize into other water; if thou canst not in cold, in warm.
3. But if thou hast not either, pour water upon the head thrice, in the name of the Father and of the Son and of the Holy Spirit.

4. Now before the baptism, let him that is baptizing and him that is being baptized fast, and any others who can; but thou biddest him who is being baptized to fast one or two days before.

The "things spoken beforehand" are the moral precepts known as the two ways, the one of life and the other of death, with which the tract begins. This body of moral teaching is older than the rest of the tract, and may go back to the year A.D. 80.

Justin thus describes the rite in ch. xli. of his first Apology, (c. 140):—

"I will also relate the manner in which we dedicated ourselves to God when we had been made new through Christ. As many as are persuaded and believe that what we teach and say is true, and undertake to be able to live accordingly, are instructed to pray and entreat God with fasting, for the remission of their sins that are past, we praying and fasting with them. Then they are brought by us where there is water, and are regenerated in the same manner in which we were ourselves regenerated. For in the name of God, the Father and Lord of the universe, and of our Saviour Jesus Christ and of the Holy Spirit, they then receive the washing with water." In the sequel Justin adds:

There is pronounced over him who chooses to be born again, and has repented of his sins, the name of God the Father and Lord of the universe, he who leads to the latter the person that is to be washed calling him by this name alone. For no one can utter the name of the ineffable God, and this washing is called Illumination (Gr. φωτισμος), because they who learn these things are illuminated in their understandings. And in the name of Jesus Christ, who was crucified under Pontius Pilate, and in the name of the Holy Ghost, who through the prophets foretold all things about Jesus, he who is illuminated is washed.

In ch. xiv. of the dialogue with Trypho, Justin asserts, as against Jewish rites of ablation, that Christian baptism alone can purify those who have repented. "This," he says, "is the water of life. But the cisterns which you have dug for yourselves are broken and profitless to you. For what is the use of that baptism which cleanses the flesh and body alone? Baptize the soul from wrath, from envy and from hatred; and, lo, the body is pure."

In ch. xlii. of the same dialogue Justin remarks that "those who have approached God through Jesus Christ have received a circumcision, not carnal, but spiritual, after the manner of Enoch."

In after ages baptism was regularly called illumination. Late in the 2nd century Tertullian describes the rite of baptism in his treatise On the Resurrection of the Flesh, thus:

1. The flesh is washed, that the soul may be freed from stain.
2. The flesh is anointed, that the soul may be consecrated.
3. The flesh is sealed (i.e. signed with the cross), that the soul also may be protected.
4. The flesh is overshadowed with imposition of hands, that the soul also may be illuminated by the Spirit.
5. The flesh feeds on the body and blood of Christ, that the soul also may be filled and gazed with God.
6. He also mentions elsewhere that the neophytes, after baptism, were given a draught of milk and honey. (The candidate for baptism, we further learn from his tract On Baptism, prepared himself by prayer, fasting and keeping of vigils."

Before stepping into the font, which both sexes did quite naked, the neophytes had to renounce the devil, his poms and angels. Baptisms were usually conferred at Easter and in the season of Pentecost which ensued, and by the bishop or by priests and deacons commissioned by him.

Such are the leading features of the rite in Tertullian, and they reappear in the 4th century in the rites of all the orthodox churches of East and West; Tertullian testifies that the Marcionites observed the particulars numbered one to six, which must therefore go back at least to the year 150. About the year 300, those desirous of being baptized were (a) admitted to the catechumenate, giving in their names to the bishop. (b) They were subjected to a scrutiny and prepared, as to-day in the western churches the young are prepared for confirmation. The catechetical course included instruction in monotheism, in the folly of polytheism, in the Christian scheme of salvation, &c. (c) They were again and again exercised, in order to rid them of the lingering taint of the worship of demons. (d) Some days or even weeks beforehand they had the creed recited to them. They might not write it down, but learned it by heart and had to repeat it just before baptism. This rite was called in the West the traditio and reddito of the symbol. The Lord's Prayer was communicated with similar solemnity in the West.
BAPTISM

(nobiliori precis). The creed given in Rome was the so-called Apostles’ Creed, originally compiled as we now have it to exclude Marcionites. In the East various other symbols were used. (a) There followed an act of unction, made in the East with the oil of the catechumens blessed only by the priest, in the West with the priest’s saliva applied to the lips and ears. The latter was accompanied by the following formula: “Efeta, that is, be thou opened unto odour of sweetness. But do thou flee, O Devil, for the judgment of God is at hand.” (f) Renunciation of Satan. The catechumens turned to the west in pronouncing this; then turning to the east they recited the creed. (g) They stepped into the font, but were not usually immersed, and the priest recited the baptismal formula over them as he poured water, generally thrice, over their heads. (h) They were anointed all over with chrism or scented oil, the priest reciting an appropriate formula. Deacons anointed the males, deaconesses the females. (i) They put on white garments and often baptismal wreaths or chaplets as well. In some churches they had worn cowls during the catechumenate, in sign of repentance of their sins. (j) They received the sign of the cross on the brow; the bishop usually dipped his thumb in the chrism and said: “In name of Father, Son and Holy Ghost, peace be with thee.” In laying his hands on their heads the bishop in many places, especially in the West, called down upon them the sevenfold spirit. (k) The first communion followed, with milk and honey added. (l) Usually the water in the font was exorcised, blessed and chrism poured into it, just before the catechumen entered it. (m) Easter was the usual season of baptism, but in the East Epiphany was equally favoured. Pentecost was sometimes chosen. We hear of all three festivals being habitually chosen in Jerusalem early in the 4th century, but fifty years later baptisms seem to have been almost confined to Easter. The preparatory fasts of the catechumens must have helped to establish the Lenten fast, if indeed they were not its origin. Certain features of baptism as used during the earlier centuries must now be noticed. They are the following:—(1) Use of fonts; (2) Status of baptizer; (3) Immersion, submersion or aspersion; (4) Exorcism; (5) Baptismal formula and trine immersion; (6) The age of baptism; (7) Confirmation; (8) Disciplina arcana; (9) Regeneration; (10) Relation to repentance; (11) Baptism for the dead; (12) Use of the name; (13) Origin of the institution; (14) Analogous rites in other religions.

1. Fonts.—The New Testament, the Didache, Justin, Tertullian and other early sources do not enjoin the use of a font, and contemplate in general the use of running or living water. It was a Jewish rule that in ablutions the water should run over and away from the parts of the body washed. In acts of martyrdom, as late as the age of Decess, we read of baptisms in rivers, in lakes and in the sea. In exceptional cases it sufficed for a martyr to be sprinkled with his own blood. But a martyr’s death in itself was enough. Nearchus (c. 270) dipped the toe of his baptized friend Polyaeuctes, when on the scaffold he asked if it were possible to attain salvation without baptism, with this answer: ”Behold, we see the Lord, when they brought to Him the blind that they might be healed, had nothing to say to them about the holy mystery, nor did He ask them if they had been baptized; but this only, whether they came to Him with true faith. Wherefore He asked them, Do ye believe that I am able to do this thing?”

Tertullian (c. 200) writes (de Bapt. iv.) thus: “It makes no difference whether one is washed in the sea or in a pool, in a river or spring, in a lake or a ditch. Nor can we distinguish between those whom John baptized (hymen) in the Jordan and those whom Peter baptized in the Tiber.” The custom of baptizing in the rivers when they are annually blessed at Epiphany, the feast of the Lord’s baptism, still survives in Armenia and in the East generally. Those of the Armenians and Syrians who have retained adult baptism use rivers alone at any time of year.

The church of Tyre described by Eusebius (H. E. x. 4) seems to have had a font, and the church order of Macarius, bishop of Jerusalem (c. 311-235), orders the font to be placed in the same building as the altar, behind it and on the right hand; but the same order lays down that a font is not essential in cases of illness for “the Holy Spirit is not hindered by want of a vessel.”

2. Status of Baptizer.—Ignatius (Smyrn. viii.) wrote that it is not lawful to baptize or hold an aspæt (Lord’s Supper) without the bishop. So Tertullian (de Bapt. xvi.) reserves the right of admitting to baptism and of conferring it to the summus sacros or bishop, Cyprian (Epist. lxxii. 7) to bishops and priests. Later canons continued this restriction; and although in outlying parts of Christendom deacons claimed the right, the official churches accorded it to presbyters alone and none but bishops could perform the confirmation or seal. In the Montanist churches women baptized, and of this there are traces in the earliest church and in the Caucasus. Thus St Thekla baptized herself in her own blood, and St Nino, the female evangelist of Georgia, baptized king Mirian (see “Life of Nino,” Studia Biblica, 1903). In cases of imminent death a layman or a woman could baptize, and in the case of new-born children it is often necessary.

3. Immersion or Aspersion.—The Didache bids us “pour water on the head,” and Christian pictures and sculptures ranging from the 1st to the 10th century represent the baptizing as standing in the water, while the baptizer pours water from his hand or from a vessel over his head. Even if we allow for the difficulty of representing complete submersion in art, it is nevertheless clear that it was not insisted on; nor were the earliest fonts, to judge from the ruins of them, large and deep enough for such an usage. The earliest literary notices of baptism are far from conclusive in favour of submersion, and are often to be regarded as merely rhetorical. The rubrics of the MSS., it is true, enjoins total immersion, but it only came into general vogue in the 7th century, “when the growing rarity of adult baptism made the Or. word (bànliw) patient of an interpretation that suited that of infants only.” The Key of Truth, the manual of old Armenian Baptists, archaically prescribes that the penitent admitted into the church shall advance on his knees into the middle of the water and that the elect one or bishop shall then pour water over his head.

4. Exorcism.—The Didache and Justin merely prescribe fasting, the use of which was to hurry the exit of evil spirits who, in choosing a nidus or tenement, preferred a well-fed body to an emancipated one, according to the belief embodied in the interpolated saying of Matt. xvii. 21: “This kind of demon goeth not forth except by prayer and fasting.” The exorcisms tended to become longer and longer, the later the rite. The English prayer-book excludes them, as it also excludes the renunciation of the devil and all his angels, his pomps and works. These elements were old, but scarcely primitive; and the archaic rite of the Key of Truth (see PAULICANS) is without them. Basil, in his work On the Holy Spirit, confesses his ignorance of the words of this other feature of his baptismal rite had originated. He instances the blessing of the water of baptism, of the oil of anointing and of the baptizing herself, the use of anointing him with oil, trine immersion, the formal renunciation of Satan and his angels. All these features, he says, had been handed down in an unpublished and unspoken teaching, in a silent and sacramental tradition.

5. The Baptismal Formula.—The trinitarian formula and trine immersion were not uniformly used from the beginning, nor did they always go together. The Teaching of the Apostles, indeed, prescribes baptism in the name of Father, Son and Holy Ghost, but on the next page speaks of those who have been baptized into the name of the Lord—the normal formula of the New Testament. In the 3rd century baptism in the name of Christ was still so widespread that Pope Stephen, in opposition to Cyprian of Carthage, declared it to be valid. From Pope Zacharias (Ep. x) we learn that the Celtic missionaries in baptizing omitted one or more persons of the Trinity, and this was one of the reasons why the church of Rome anathematized

---

1 Rogers’ essay on Baptism and Christian Archaeology in Studia Biblica, vol. v.
them; Pope Nicholas, however (898–966), in the Responsa ad consultia Bulgarorum allowed baptism to be valid tautum in nomine Christi, as in the Acts. Basil, in his work On the Holy Spirit just mentioned, condemns “baptism into the Lord alone” as insufficient. Baptism “into the death of Christ” is often specified by the Armenian fathers as that which alone was essential.

Ursinus, an African monk (in Gennad. de Scr. Eccl. xxvii.), Hilary (de Synodis, lxxxv.), the synod of Nemours (a.d. 1284), also asserted that baptism into the name of Christ alone was valid. The formula of Rome is, “I baptize thee in the name of Father and Son and Holy Spirit.” In the East, “so-and-so, the servant of God, is baptized,” &c. The Greeks add ΑΜΗΝ after each person, and conclude with the words, “Now and ever and to aeons of aeons.”

We first find in Tertullian trine immersion explained from the triple invocation, Nam nec semel, sed ter, ad singula nominata personas singulas singulmum: “Not once, but thrice, for the several names, into the several persons, are we dipped” (ad loc. Praz. xxvii.). And Jerome says: “We are thrice plunged, that this sacrament of the Trinity may be shown forth.” On the other hand, in numerous fathers of East and West, e.g. Leo of Rome, Athanasius, Gregory of Nyssa, Theophylactus, Cyril of Jerusalem and others, trine immersion was regarded as being symbolic of the three days’ entombment of Christ; and in the Armenian baptismal rubric this interpretation is enjoined, as also in an epistle of Macarius of Jerusalem addressed to the Armenians (c. 330). In Armenian writers this interpretation is further associated with the idea of baptism into the death of Christ.

Trine immersion then, as to the origin of which Basil confesses his ignorance, must be older than either of the rival explanations. These are clearly aetiological, and invented to explain an existing custom, which the church had adopted from its pagan medium. For pagan usages were normally threefold; thus Virgil writes (Aen. vi. 220): Ter socios pura circumulat unda. Ovid (Met. vii. 189 and Fasti, iv. 357). Persius (ii. 16) and Horace (Met. i. 37) similarly speak of trine usages; and on the mentioned passage the scholiast Acer remarks: “He uses the words thrice purely, because people in expiating their sins, plunge themselves in thrice.” Such examples of the ancient usage encounter us everywhere in Greek and Latin antiquity.

6. Age of Baptism.—In the oldest Greek, Armenian, Syrian and other rites of baptism, a service of giving a Christian (i.e. non-pagan) name, or of sealing a child on its eighth day, is found. According to it the priest, either at the door of the church or at the home, blessed the infant, sealed it (this not in Armenia) with the sign of the cross on its forehead, and prayed that in due season (in kau̇po e̱ldι̱ergι̱) or at the proper time (Armenian) it may enter the holy Catholic church. This rite announces itself as the analogue of Christ’s circumcision.

On the fortieth day from birth another rite is prescribed, of churc̊hing the child, which is now taken into the church with its mother. Both are blessed by the clergy, whose petition now is that the child may preserve its child and cause him to grow up by the unseen grace of His power and made him worthy in due season of the washing of baptism.” As the first rite corresponds to the circumcision and naming of Jesus, so does the second to His presentation in the temple. These two rites really begin the catechumenate or period of instruction in the faith and discipline of the church. It depended on the individual how long he would wait for initiation. Whenever he felt inclined, he gave in his name as a candidate. This was usually done at the beginning of Lent. The bishop and clergy next examined the candidates one by one, and ascertained from their neighbours whether they had led such exemplary lives as to be worthy of admission. In case of strangers from another church certificates of character had to be produced. If a man seemed unworthy, the bishop dismissed him until another occasion, when he might be worthier; but if all was satisfactory he was admitted, in the West as a candidens or asker, in the East as a υποκρι̱τη̱ς, i.e. one in course of being illuminated. Usually two sponsors made themselves responsible for the past life of the candidate and for the sincerity of his faith and repentance. The essential thing was that a man should come to baptism of his own free will and not under compulsion or from hope of gain. Macarius of Jerusalem (Op. cit.) declares that the grace of the spirit is given in answer to our prayers and entreaties for it, and that even a font is not needful, but only the wish and desire for grace. Tertullian, however, in his work On Baptism, holds that even that is not always enough. Some girls and boys at Carthage had asked to be baptized, and there were some who urged the granting of their request on the score that Christ said: “Forbid them not to come unto Me” (Matt. xix. 14), and: “To each that asketh thee give” (Luke vi. 30). Tertullian replies that “We must beware of giving the holy thing to dogs and of casting pearls before swine.” He cites 1 Tim. v. 22: “Let not thy hands hastily, lest thou share in another’s sins.” He denies that the precedents of the eunuch baptized by Philip or of Paul baptized without hesitation by Simon (to which the other party appealed) were relevant. He dwells on the risk run by the sponsors, in case the candidates for whose purity they went bail should fall into sin. It is more expedient, he concludes, to stay baptism. Why should persons still in the age of innocence be in a hurry to be baptized and win remission of sins? Let people first learn to feel their need of salvation, so that we may be sure of giving it only to those who really want it. Especially let the unmarried postpone it. The risks of the age of puberty are extreme. Let people have married or be anyhow steadied in continence before they are admitted to baptism. It would appear from the homilies of Aphraates (c. 340) that in the Syriac church also it was usual to renounce the married relation after baptism. Cyril of Jerusalem, in his Catecheses, insists on “the longing for the heavenly polity, on the goodly resolution and attendant hope” of the catechumen (Pro. Cat. ch. i.). If the resolution be not genuine, the body washing, he says, profits nothing. “God asks for nothing else except a goodly determination. Say not: How can my sins be wiped out? I tell thee, by willing, by believing” (ch. viii.). So again (Cat. i. ch. iii.) “God gives not his holy treasures to the poor, but where he sees the goodly determination, there he bestows the seed of salvation. . . . Those then who would receive the spiritual saving seal have need of a determination and will of their own. . . . Grace has need of faith on our part.”

In Jerusalem, therefore, whither believers flocked from all over Christendom to be buried, the official point of view as late as a.d. 350 was entirely that of Tertullian. Tertullian’s scruples were not long respected in Carthage, for in Cyprian’s works (c. 250) we already hear of new-born infants being baptized. In the same region of Africa, however, Monica would not let her son Augustine be baptized in boyhood, though he clamoured to be. She was a conservative. In the Greek world thirty was a usual age in the 4th century for persons to be baptized, in imitation of Christ. It is still the age preferred by the Baptists of Armenia. But it was often delayed until the deathbed, for the primitive idea that mortal sins committed after baptism were sins against the Holy Spirit and unforgivable, still influenced men, and suggested that they were as better staying in infancy. The fathers, however, of the 4th century emphasized already the danger of deferring the rite until men fall into mortal sickness, when they may be unconscious or paralysed or otherwise unable to profess their faith and repentance, or to swallow the viaticum. Gregory Theologus therefore (c. 340) suggests the age of three years as suitable for baptism, because by then a child is old enough, if not to understand the questions put to him, at any rate to speak and make the necessary responses. Gregory sanctions the baptism of infants only where there is imminent danger of death. “It is better that they should be sanctified without their own sense of it than that they pass away unsealed and uninitiated.” And he justifies his view by this, that circumcision, which foreshadowed the Christian seal (εφαρμισθη), was imposed on the eighth day on those who as yet had no use of reason. He also urges the analogue of “the anointing of the doorposts, which preserved the first-born by things that have no sense.” On such grounds was justified the transition of a baptism which began as a spontaneous act of
self-consecration into an opus operatum. How long after this it was before infant baptism became normal inside the Byzantine church, we do not exactly know, but it was natural that mothers should insist on their children being liberated from Satan and safeguarded from demons as soon as might be. The change came more quickly in Latin than in Greek Christendom, and very slowly indeed in the Armenian and Georgian churches. Augustine’s insistence on original sin, a doctrine never quite accepted in his sense in the East, hurried on the change.

7. Confirmation.—In the West, however, the sacrament has been saved from becoming merely magical by the rite of confirmation or of reception of the Spirit being separated from the baptism of regeneration and reserved for an adult age. The English church confirms at fifteen or sixteen; the Roman rather earlier. The catechetical course, which formerly preceded the complete rite, now intervenes between its two halves; and the sponsors who formerly attested the worthiness of the candidate and received him up as anadochi out of the font, have become god-parents, who take the baptismal vows vicariously for infants who cannot answer for themselves. In the East, on the contrary, the complete rite is read over the child, who is thus confirmed from the first. The Roman church already for some time—since the 3rd century and gave a peculiar sanctification as early as the 3rd century, when it decreed that persons already baptized by heretics, but reverting to the church should not be baptized over again, but only have hands laid on them. It was otherwise in Africa and the East. Here they insisted in such cases on a repetition of the entire rite, baptism and confirmation together. The Cathars (q.v.) of the middle ages discarded water baptism altogether as being a Jewish rite, but retained the laying on of hands with the traditio precis as sufficient initiation. This they called the spiritual baptism, and interpreted Matt. xxviii. 19, as a command to practise it, and not water baptism.

8. Disciplina arcani.—The communication to the candidates of the Creed and Lord’s Prayer was a solemn rite. Cyril of Jerusalem, in his instruction of the catechumens, urges them to learn the Creed by heart, but not write it down. On no account must they divulge it to unbaptized persons. The same rule already exists in us in Clement of Alexandria before the year 200. In time this rule gave rise to what is called the Disciplina arcani. Following the fashion of the Jews, and also given a peculiar sanctification as early as the 3rd century, when it decreed that persons already baptized by heretics, but reverting to the church should not be baptized over again, but only have hands laid on them. It was otherwise in Africa and the East. Here they insisted in such cases on a repetition of the entire rite, baptism and confirmation together. The Cathars (q.v.) of the middle ages discarded water baptism altogether as being a Jewish rite, but retained the laying on of hands with the traditio precis as sufficient initiation. This they called the spiritual baptism, and interpreted Matt. xxviii. 19, as a command to practise it, and not water baptism.

9. Regeneration.—The idea of regeneration seldom occurs in the New Testament, and perhaps not at all in connexion with baptism; for in the conversation with Nicodemus, John iii. 3-8, the words “of water and ” in v. 5 offend the context, spiritual

BAPTISM

367

re-birth alone being insisted upon in vv. 3, 6, 7 and 8; moreover, Justin Martyr, who cites v. 5, seems to omit them. Nor is there any mention of water in ch. i. 13, where, according to the oldest text, Christ is represented as having been born or begotten of blood, nor of the will of the flesh, nor of the will of man, but of God.

In 1 Pet. i. 3, it is said of the saints that God the Father begat them anew unto a living hope by the resurrection of Jesus, and in v. 23 that they have been begotten again, not of corruptible seed, but of incorruptible seed, through the word of God. But here again it is not clear that the writer has in view water baptism or any rite at all as the means and occasion of regeneration. In the conversation with Nicodemus we seem to hear a protest against the growing tendency of the last years of the 1st century to substitute formal sacraments for the free affluence of the spirit, and to “crib, cabin and confine” the gift of prophecy.

The passage where re-birth is best put forward in connexion with baptism is Luke iii. 22, where ancient texts, including the Gospel of the Hebrews, read, “Thou art my beloved Son, this day have I begotten Thee.” These words were taken in the sense that Jesus was then re-begotten of the Spirit an adoptive Son of God (see Matthew and Mark). But this was a mere figurative adoptionist school of Christology. It appears to imply the symbolizing of Christ as a fish in the art of the catacombs, and in the literature of the 2nd century. Tertullian prefaces with this idea his work on baptism. Nos pisciculi secundum IXOTN nostrum Jesum Christum in aqua nasci mum. “We little fishes, after the example of our Fish Jesus Christ, are born in the water.” So about the year 440 the Gaulish poet Orientius wrote of Christ; Piscis natus aquae,uctor baptismatis ipse est. “A fish born of the waters is himself originator of baptism.”

But before his time and within a hundred years of Tertullian this symbolism in its original significance had become heretical, and the orthodox were thrown back on another explanation of it. This was that the word IXOTFI is made up of the letters which begin the Greek words meaning “Jesus Christ, Son of God, Saviour.” An entirely mythology soon grew up around the idea of re-birth. The font was viewed as the womb of the virgin mother church, who was in some congregations, for example, in the early churches of Gaul, no abstraction, but a divine womb, the -sponsa. It was therefore, without the need for ceremonial, the recipient even of hymns of praise and humble supplications. Other mythopoeic growths succeeded, one of which must be noticed. The sponsors or anadochi, who, after the introduction of infant baptism came to be called god-fathers and god-mothers, were really in a spiritual relation to the children they took up out of the font. This relation was soon by the canonists identified with the blood-tie which connects real parents with their offspring, and the corollary drawn that children, who in baptism had the same god-parent, were real brothers and sisters, who might not marry either each the other or real children of the said god-parent. The reformed churches have set aside this fiction, but in the Latin and Eastern churches it has created a distinct and very powerful marriage taboo.

10. Relation to Repentance.—Baptism justified the believer, that is to say, constituted him a saint whose past sins were abolished. Sin after baptism excluded the sinner afresh from the divine grace and from the sacraments. He fell back into the status of a catechumen, and it was much discussed from the 2nd century onwards whether he could be restored to the church at all, and, if so, how. This was described as a ‘second catechumancy’, by which, after a fresh term of repentance, marked by austerities more strict than any Trappist monk imposes on himself to-day, the persons lapsed from grace could return to the church. In effect this rite was a repetition of baptism, the water of the font alone being omitted. Such restoration could in the earlier church only be effected once. A second lapse from the state of grace entailed perpetual exclusion from the sacraments, the means of salvation. As has been remarked above, the terror of post-baptismal sin and the fact that only one restoration was allowable influenced many as late as the 4th century to remain catechumens all their lives, and, like Constantine, to receive baptism on the
deathbed alone. The same scruples endured among the medieval Cathars. (See Peneance and Novitians.)

1. Baptism for the Dead.—Paul, in 1 Cor. xv. 20, glances at this as an established practice familiar to those whom he addresses. Three explanations are possible: (1) The saints before they were quickened or made alive together with Christ, were dead through their trespasses and sins. In baptism they were buried with Christ and rose, like Him, from the dead. We can, therefore, paraphrase v. 29 thus: “Else what shall they do which are baptized for their dead selves?” &c. It is in behalf of his own sinful, i.e. dead self, that the sinner is baptized and receives eternal life. (2) Contact with the dead entailed a pollution which lasted at least a day and must be washed away by ablutions, before a man is re-admitted to religious cult. This was the rule among the Jews. Is it possible that the words “for the dead” signify “because of contact with the dead”? (3) Both these explanations are forced, and it is more probable that by a make-believe common in all religions, and not unknown in the earliest church, the sins of dead relatives, about whose salvation their survivors were anxious, were transferred into another. Both the was by his own sinful, i.e. dead self, that the sinner is baptized and receives eternal life. The Mormons have this rite. The idea of transferring sin into another man or into an animal, and so getting it purged through him or it, was widespread in the age of Paul and long afterwards. Chrysostom says that the substitutes were put into the beds of the deceased, and assuming the voice of the dead asked for baptism and remission of sins. Tertullian and others attest this custom among the followers of Cerinthus and Marcion.

12. Use of the Name.—In Acts iv. 7, the rulers and priests of the Jews summon Peter and inquire by what power or in what name he has healed the lame. Here a belief is assumed which pervades ancient magic and religion. Only so far as we can get away from the modern view that a person’s name is a thrilling accident, and breathe the atmosphere which broods over ancient religions, can we understand the use of the name in baptisms, exorcisms, prayers, purifications and consecrations.

For a name carried with it, for those who were so blessed as to be acquainted with it, whatever power and influence its owner wielded in heaven or on earth or under the earth. A vow or prayer formulated in or through a certain name was fraught with the prestige of him whose name it was. Thus the psalmist addressing Jehovah cries (Ps. liv. 1): “Save me, O God, by Thy name, and judge me in Thy might.” And in Acts iii. 16, it is the name itself which renders strong and whole the man who believed therein. In Acts xvii. 15, the Jews assail Paul because he has trusted and appealed to the name of a Messiah whom they regard as an overthrower of the law; for Paul believed that God had invested Jesus with a name above all names, potent to constrain and overcome all lesser powers, good or evil, in heaven or earth or under earth. Baptism then in the name or through the name or into the name of Christ placed the souls of Christians in the presence of Christ’s personality as he was before he was in popular estimation under the influence of stars and horoscope. Nay, more, it imparted that personality into him, making him a limb or member of Christ’s body, and immortal as Christ was immortal. Nearly all the passages in which the word name is used in the New Testament become more intelligible if it be rendered personality. In Rev. xi. 13, the reveris are obliged to render it by persons, and should equally have done so in iii. 4: “Thou hast a few names (i.e. persons) in Sardis which did not defile their garments.” (See Consecration.)

13. Origin of Christian Baptism.—When it is asked, Was this a continuance of the baptism of John or was it merely the baptism of proselytes?—a distinction is implied between the two latter which was not always real. In relation to the publicans and soldiers who, smitten with remorse, sought out John in the wilderness, his baptism was a purification from their past and so far identical with the proselyte’s bath; but so far as it raised them up to be children unto Abraham and filled them with the Messianic hope, it advanced them further than that bath could do, and assured them of a place in the kingdom of God, soon to be established—this, without imposing circumcision on them; for the ordinary proselyte was circumcised as well as baptized.

For the Jews, however, who came to John, his baptism could not have the significance of the proselyte’s baptism, but rather accorded with another baptism undergone by Jews who wished to consecrate their lives by stricter study and practice of the law. So Epictetus remarks that he only really understands Judaism who knows “the baptized Jew” (τῶν βαπτισμένων). We gather from Acts xix. 4, that John had merely baptized in the name of the coming Messiah, without identifying him with Jesus of Nazareth. The apostolic age supplied this identification, and the normal use during it seems to have been “into Christ Jesus,” or “in the name of the Lord Jesus Christ,” or “of Jesus Christ” simply, or “of the Lord Jesus Christ.” Paul explains these formulas as being equivalent to “into the death of Christ Jesus,” as if the faithful were in the rite raised from death into everlasting life. The likeness of the baptismal ceremony with Christ’s death and resurrection ensured a real union with him of the believer who underwent the ceremony, according to the well-known principle in sacris simulac pro veris accipi.

But opinion was still fluid about baptism in the apostolic age, especially as to its connexion with the descent of the Spirit. The Spirit falls on the disciples and others at Pentecost without any baptism at all, and Paul alone of the apostles was baptized. So far was the affluence of the Spirit from being conditioned by the rite, that in Acts x. 33 ff., the gift of the Spirit was first poured out upon the Gentiles who heard the word preached so that they spoke with tongues, and it was only after these manifestations that they were baptized with water in the name of Jesus Christ at the instance of Peter. We can divine from this passage why Paul was so eager himself to preach the word, and left it to others to baptize.

But as a rule the repentant underwent baptism in the name of Christ Jesus, and washed away their sins before hands were laid upon them unto reception of the Spirit. Apostles, who only knew the baptism of John (Acts xviii. 25), needed only instruction in the prophetic gnorιs at the hands of Priscilla and Aquila in order to become a full disciple. On the other hand, in Acts xix. 1-7, twelve disciples, for such they were already accounted, who had been baptized into John’s baptism, i.e. into the name of him that should follow John, but had not even heard of the Holy Spirit, are at Paul’s instance re-baptized into the name of the Lord Jesus. Then Paul himself lays hands on them and the Holy Ghost comes upon them, so that they speak with tongues and prophecy. Not only do we hear of these varieties of practice, but also of the laying on of hands together with prayer as a substantive rite unconnected with baptism. The seven deacons were so ordained. And this rite of laying on hands, which was in antiquity a recognized way of transmitting the occult power or virtue of one man into another, is used in Acts ix. 17; by Ananias, in order that Paul may recover his sight and be filled with the Holy Ghost. The laying on of hands of Barnabas equally are separated for a certain missionary work by John Mark, but without prayer and fasting, and are so sent forth by the Holy Ghost. It was also a way of healing the sick (Acts xxviii. 8), and as such accompanied by anointing with oil (Jas. v. 14). The Roman church then had early precedents for separating confirmation from baptism. It would also appear that in the primitive age confirmation and ordination were one and the same rite; and so they continued to be among the dissident believers of the middle ages, who, however, often dropped the water rite altogether. (See Cathars.) More than one sect of the 2nd century rejected water baptism on the ground that knowledge of the truth in itself makes us free, and that external material washing of a perishable body cannot contribute to the illumination of the inner man, complete without it. St Paul himself recognizes (1 Cor. vii. 14) that children, one of whose parents only is a believer, are ipso facto not unclean, but holy. Even an unbelieving husband or wife is sanctified by a believing partner. And if we remember the force of the words δύο ἄνθρωποι (cf. 1 Cor.
i. 2); here used of children and parents, we realize how far off was St Paul from the positions of Augustine.

The question arises whether Jesus Himself instituted baptism as a condition of entry into the Messianic kingdom. The fourth gospel (iii. 22, and iv. 1) asserts that Jesus Himself baptized on a greater scale than the Baptist, but immediately adds that Jesus Himself baptized not, but only His disciples, as if the writer felt that he had too boldly contradicted the older tradition of the other gospels. Nor in these is it recorded that the disciples baptized during their Master's lifetime; indeed the very contrary is implied. There remain two texts in which the injunction to baptize is attributed to Jesus, namely, Mark xvi. 16 and Matt. xxviii. 18-20. Of these the first is part of an appendix headed "of Ariston the elder" in an old Armenian codex, and taken perhaps from the lost compilations of Plassas; as to the other text, it has been doubted by many critics, e.g. Neander, Harnack, Dr Armitage Robinson and James Martineau, whether it represents a real utterance of Christ and not rather the liturgical usage of the region in which the first gospel was compiled. The circumstance is unknown to these critics when they made their conjectures, that Eusebius Pamphilus, in nearly a score of citations, substitutes the words "in My Name" for the words "baptizing them into the name of the Father and of the Son and of the Holy Ghost," renders their conjectures superfluous. Aphraates also in citing the verse substitutes "and they shall believe in Me"—a paraphrase of "in My Name." The first gospel thus falls into line with the rest of the New Testament.

14. Analogous Rites in other Religions (see also PURIFICATION).

—The Fathers themselves were the first to recognize that "the devil too had his sacraments," and that the Essenes, Isiac, Mithraic and other mysteries used baptism in their rites of initiation. But it is not to be supposed that the Christians borrowed from these or from any Gentile source any essential features of their baptismal rites. Baptism was long before the advent of Jesus used in the worship of the Persians; and existed inside Judaism itself.

It has been remarked that the developed ceremony of baptism, with its threefold renunciation, resembles the ceremony of Roman law known asemanzipatio, by which the patria potestas (or power of life and death of the father over his son) was extinguished. Under the law of the XII. Tables the father lost it, if he three times sold his child. This suggested a regular procedure, according to which the father sold his son thrice into manuspium, while after each sale the fictitious vendee emancipated the son, by manumissio vindicta, i.e. by laying his rod (vindicta) on the slave and claiming him as free (vindictio in libertaem). Then the owner also laid his rod on the slave, declaring his intention to enfranchise him, and the praetor by his adductor confirmed the owner's declaration. The third manumission thus gave to the son and slave his freedom. It is possible that this common ceremony of Roman law suggested the triple abrenuntatio of Satan. Like the legal ceremony, baptism freed the believer from one (Satan) who, by the mere fact of the believer's birth, had power of death over him. And as the legal manumission dissolved a son's previous agnatic relationships, so, too, the person who was baptized gave up father and mother, and became one of a society of brethren the bond between whom was not physical but spiritual. The idea of adoption in baptism as a son and heir of God was almost certainly taken by Paul from Roman law.

The ceremony of turning to the west three times with renunciation of the Evil One, then to the east, is exactly paralleled in a rite of purification by water common among the Malays and described by Skat in his book on Malay magic. If the Malay rite is not derived through Mahomedanism from Christianity, it is a remarkable example of how similar psychological conditions can produce almost identical rites.

The idea of spiritual rebirth, so soon associated with baptism, was of wide currency in ancient religions. It is met with in Philo of Alexandria and was familiar to the Jews. Thus the proselyte is said in the Talmud to resemble a child and must bathe in the name of God. The Jordan is declared in a Kings v. 10 to be a cleansing medium, and Naaman's cure was held to pre-figure Christian baptism. Jerome relates that the Jew who taught him Hebrew communicated to him a teaching of the Rabbi Baraciba, that the inner man who rises up in us at the fourteenth year after puberty (i.e. at 29) is better than the man who is born from the mother's womb.

In a Paris papyrus edited by Albr. Dieterich (Leipzig, 1903) under the title of Eine Mithrasliturgie, an ancient mystic describes his re-birth in impressive language. In a prayer addressed to "First birth of my birth, first beginning (or principle) of my beginning, first spirit of the spirit in me," he prays "to be restored to his deathless birth (genesis), albeit he is let and hindered by his underlying nature, to the end that according to the pressing need and spur of his longing he may gaze upon the deathless principle with deathless spirit, through the deathless water, through the solid and the air; that he may be re-born through reason (or idea), that he may be consecrated, and the holy spirit breathe in him, that he may admire the holy fire, that he may behold the abyss of the Orient, dread water, and that he may be heard of the quickening and circumambient ether; for this day he is about to gaze on the revealed reality with deathless eyes; a mortal born of mortal womb, he has been enhanced in excellence by the might of the All-powerful and by the right hand of the Deathless one," &c.

This is but one specimen of the pious ejaculations, which in the first centuries were rising from the lips of thousands of mystae, in Egypt, Asia Minor, Italy and elsewhere. The idea of re-birth was in the air; it was the very keynote of all the solemn initiations and mysteries—Mythraic, Orphic, Eleusinian—through which repentant pagans secured pardon and eternal bliss. Yet there is not much evidence that the church directly borrowed many of its ceremonies or interpretations from outside sources. They for the most part originated among the believers, and not improbably the outside cults borrowed as much from the church as it took from them.

AUTHORITIES.—The following ancient works are recommended: Tertullian, De Baptismo (edition with introd. J. M. Lupron, 1909); G. Schurr, Das Sakrifikal in den Apostolischen Apokryphen; Gregory Nazianzen, Ort. 40; Gregory Nyss. Oratio in eos qui differt ibus baptismum; Sacramentary of St. Thumas, Augustine, De Baptismo contra Donatistis; Joc. Goar, Ritual Pacorunum (gives the current Greek rites); F. C. Conybeare, Ritual Armenum (the oldest forms of Armenian and Greek rites); Gerard G. Vossius, De Baptismo (Amsterdam, 1648); Edmond Martene, De Ant. Ecclesiæ Ritibus (gives Western rites) (Bassani, 1730); and the modern literature, perhaps the most exhaustive works are F. W. Höfling, Das Sacrament der Taufe (Breisgau, 1859); Jos. Bingham's Antiquities (London, 1834), and W. Wall, On Infant Baptism (London, 1807); J. Anrich, Das antike Mysterienspiel (Breisgau, 1834), describes the corresponding rites of the Greek mysteries, and A. Dürckheim, Eine Mithraisches Liturgi (Leipzig, 1893); J. C. Suicer, Thesaurus, sub vocæ barbaræ; Ad. Harnack, Dogmengeschichte (Freiburg im Br. 1894); L. Duchesne, Origines du culte chrétien (Paris, 1898); Mgr. P. Batifol, Études historiques (Paris, 1904); J. W. Augusti, Denkwürdigkeiten (Leipzig, 1829-1831); Monumenta Ecclesiæ Liturgica by Dom Cabrol and Dom Leclercq (Paris, 1902) (a summary of all liturgical passages given in the early Fathers); Corbel, Histoire du sacrement de baptism (2 vols. Paris, 1881) (F. C. C.)

BAPTISTE, NICOLAS ANSELME (1761-1835), French actor, was born in Bordeaux on the 18th of June 1761, the elder son of Jean Baptiste Anselme, a popular actor. His mother played leading parts in tragic comedy, and was protected by the protection of Voltaire and the friendship of Lekain. It was probably under the auspices of the latter that Nicolas Anselme made his first appearance as de Bellay in Gesta et Bayard; and shortly afterwards, under the name of Baptiste, he made a contract to play young lover parts at Arras, where he also appeared in opera and even in pantomime. From Rouen, where he had three successful years, his reputation spread to Paris and he was summoned to the new theatre which the comedian Langlois-Courelles had just founded, and where he succeeded, not only in making an engagement for himself, but in bringing all his family, father, mother, wife and brother. They were thus distinguished in the playbills: Baptiste, até, Baptiste père, Baptiste cadet, Madame Baptiste mère, Madame Baptiste bru. This resulted in the pun of calling a play in which they all appeared une pièce de baptistes. Nicolas soon obtained the public favour, specially in La Martellière's mediocre Robert, chef de
BAPTISTERY—BAPTISTS

brigands, and as Count Almaviva in Beaumarchais' La Mère couvable. His success in this was so great that the directors of the Théâtre de la République—who had already secured Talma, Dugazon and Madame Vestris—hastened to obtain his services, and, in order to get him at once (1793), paid the 20,000 francs forfeit which he was obliged to surrender on breaking his contract. Later he, as well as his younger brother, became sociétaires. Nicolas took all the leading parts in comedy and tragedy. As he grew older his special forte lay in noble fathers. After a brilliant career of thirty-five years of uninterrupted service, he retired in 1828. But, after the revolution of 1830, when the Théâtre Français was in great straits, the brothers Baptiste came to the rescue, reappeared on the stage and helped to bring back its prosperity. The elder died in Paris on the 1st of December 1835. The younger brother, Paul Eustache Anselme, known as BAPTISTE cadet (1765–1839), was also a comedian of great talent, and had a long and brilliant career at the Comédie Française, where he made his début in 1792 in L'Amour et l'intérêt.

BAPTISTERY (Baptistiriun, in the Greek Church ψυχοτριήριον), the separate hall or chapel, connected with the early Christian Church, in which the catechumens were instructed and the sacrament of baptism administered. The name baptistery is also given to a kind of chapel in a large church, which serves the same purpose. The baptistery proper was commonly a circular basin, having a side and side apses, bounding twelve sides, and consisted of an ante-room (secundus alae) where the catechumens were instructed, and where before baptism they made their confession of faith, and an inner apartment where the sacrament was administered. In the inner apartment the principal object was the baptismal font (κολυμβήθρα, or piscina), in which those to be baptized were immersed thrice. Three steps led down to the floor of the font, and over it was suspended a gold or silver dove; while on the walls were commonly pictures of the scenes in the life of John the Baptist. The font was at first always of stone, but latterly metals were often used. Baptisteries belong to a period of the church when great numbers of adult catechumens were baptized, and when immersion was the rule. We find little or no trace of them before Constantin made Christianity the state religion, i.e. before the 4th century; and as early as the 6th century the baptismal font was built in the porch of the church and then in the church itself. After the 9th century few baptisteries were built, the most noteworthy of later date being those at Pisa, Florence, Padua, Lucca and Parma. Some of the older baptisteries were very large, so large that we have no complete plans of them being known. It was necessary to make them large, because in the early church it was customary for the bishop to baptize all the catechumens in his diocese (and so baptistries are commonly found attached to the cathedral and not to the parish churches), and also because the rite was performed only thrice in the year. (See BAPTISM.) During the months when there were no baptisms the baptistery doors were sealed with the bishop’s seal. Some baptistries were divided into two parts to separate the sexes; sometimes the church had two baptistries, one for each sex. A fireplace was often provided to warm the neophytes after immersion. Though baptisteries were forbidden to be used as burial-places by the council of Auxerre (578) they were not uncommonly used as such. Many of the early archbishops of Canterbury were buried in the baptistery there. Baptisteries, we find from the records of early councils, were first built and used to correct the evils arising from the practice of private baptism. As soon as Christianity made such progress that baptism became the rule, and as soon as immersion gave place to sprinkling, the ancient baptisteries were no longer necessary. They are not in general use, however, in Florence and Pisa. The baptistery of the Lateran must be the earliest ecclesiastical building still in use. A large part of it remains as built by Constantine. The central area, where is the basin of the font, is an octagon around which stand eight porphyry columns, with marble capitals and entablature of classical form; outside these are an ambulatory and outer walls forming a larger octagon. Attached to one side, towards the Lateran basilica, is a fine porch with two noble porphyry columns and richly carved capitals, bases and entablatures. The circular church of Santa Maria Maggiore of the 4th century, served as a baptistery and contained the tomb of the daughter of Constantine. This is a remarkably perfect structure with a central dome, columns and mosaics of classical fashion. Two side niches contain the earliest known mosaics of distinctively Christian subjects. In one is represented Moses receiving the Old Law, in the other Christ delivers to St Peter the New Law—a charter sealed with the X P monogram.

Another baptism of the earliest times has recently been excavated at Aquileia. Ruins of an early baptistery have also been found at Salona. At Ravenna exist two famous baptisteries encrusted with fine mosaics, one of them built in the middle of the 5th century, and the other in the 6th. To the latter date also belongs a large baptistery decorated with mosaics at Naples.

In the East the metropolitan baptistery at Constantinople still stands at the side of the mosque which was once the patriarchal church of St Sophia; and many others, in Syria, have been made known to us by recent researches, as also have some belonging to the churches of North Africa. In France the most famous early baptistery is St Jean at Poitiers, and other early examples exist at Riez, Fréjus and Aix. In England, a dedicatory inscription of a baptismal font is known to have been associated with the cathedral of Canterbury.

See Hefele's Concilien, passim; Du Cange, Glossary, article "Baptisterium"; Eusebius, Hist. Eccl. x. 4; Bingham's Antiquities of the Christian Church, book xi. (W. R. L.)

BAPTISTS, a body of Christians, distinguished, as their name imports, from other denominations by the view they hold respecting the ordinance of baptism (q.v.). This distinctive view, common and peculiar to all Baptists, is that baptism should be administered only to believers. The mode of administration of the ordinance has not always been the same, and some Baptists (e.g. the Mennonites) still practise baptism by pouring or sprinkling, but among those who will here be styled modern Baptists, the mode of administration is also distinctive, to wit, immersion. It should, however, be borne in mind that immersion is not peculiar to the modern Baptists. It has always been recognized by Paedobaptists as a legitimate mode, and is still practised to the exclusion of other modes by a very large proportion of paedobaptist Christendom (e.g. the Orthodox Eastern Church). We shall distinguish here between two main groups of Baptists in Europe: the Anabaptists, now practically extinct, and the modern Baptists whose churches are in nearly every European country and in all other countries where white men reside.

I. THE ANABAPTISTS

The great spiritual movement of the 15th and 16th centuries had for its most general characteristic, revolt against authority. This showed itself not merely in the anti-papal reformation of Luther, but also in the anti-feudal rising of the peasants and in a variety of anti-eclesiastical movements within the reformation areas themselves. One of the most notable of these radical anti-eclesiastical movements was that of the Zwickau prophets. (Marcus Stübner, Nikolaus Storch and Thomas Münzer): the most vigorous and notorious of that of the Münster Anabaptists. Although they have been called the "harbingers" of the Anabaptists, the characteristic teaching of the Zwickau prophets was not Anabaptism. (See, however, ANABAPTISTS.) For although Münzer repudiated infant baptism in theory, he did not relinquish its practice, nor did he insist on the re-baptism of believers. The characteristic teaching of the Zwickau movement, so closely linked with the peasant rising, was the great emphasis laid upon the "inner word." Divine revelation, said Münzer, was not received from the church, nor from preachers, least of all from the dead letter of the Bible; it was received solely and directly from the Spirit of God. It is this daring faith in divine illumination that brings the Zwickau teachers most nearly into touch with the Anabaptists. But if they are not typical of Anabaptism, still less are the later representatives of the movement in the last sad months at Münster.

The beginnings of the Anabaptist movement proper were in
Zürich, where Wilhelm Reubli (1480–1554), Konrad Grebel (d. 1526), Felix Manz (d. 1527) and Simon Strumpf separated from Zwingli and proceeded to form a separate church. They repudi-ated the use of force, advocated a scriptural communism of goods, and asserted that Christians must always exercise love and patience towards each other and so be independent of worldly tribunals. But their most radical doctrine was the rejection of infant baptism as unscriptural. They rapidly gained adherents, among whom was Hans Brüdli, pastor of Zollikon. Their refusal, however, to baptize infants, and the formation of a separate church as the outcome of this refusal, brought upon them the condemnation of Zwingli, and a number of them were banished. This act of banishment, however, drove Jörg Blaurock, Konrad Grebel and others to take the step which distinctly instituted “Anabaptism”: they baptized one another and then partook of the Lord’s Supper together. This step took them much farther than the repudiation of paedobaptism. It formed a new religious community, which sought to fashion itself on the model of primitive Christianity, rejecting all tradition and accretions later than New Testament records. Its members claimed to get back to the simple church founded on brotherly love. The result was that their numbers grew with astonishing rapidity, and scholarly saints like Balthasar Hubmaier (ca. 1480–1538) and Hans Denck (ca. 1495–1527) joined them. Hubmaier brought 110 new adherents with him, and in 1525 himself baptized 300 converts. This baptism, however, was not immersion. Blaurock and Grebel baptized each other, and many adherents, kneeling together in an ordinary room. Hubmaier baptized his 300 from one bucket. The mode was sprinkling or pouring. In all this the Anabaptists had maintained one central article of faith that linked them to the Zwickauer prophets, belief in conscience, religious feeling, or inner light, as the sole true beginning or ground of religion; and one other article, held with equal vigour and sincerity, that true Christians are like sheep among wolves, and must on no account defend themselves from their enemies or take vengeance for wrong done. Very soon this their faith was put to fiery test. Not only were Catholics and Protestants opposed to them on doctrinal grounds, but the secular powers, fearing that the new teaching was potentially as revolutionary as Münzer’s radicalism had been, soon instituted a persecution of the Anabaptists. On the 7th of March 1526 the Zürich Ruth issued an edict threatening all who were baptized anew with death by drowning, and in 1529 the emperor Charles V., at the diet of Spires, ordered Anabaptists to be put to death with fire and sword without even the form of ecclesiastical trial. A cruel persecution arose. Manz was burned to death at Zurich in 1527, and during the next year Hubmaier was burned to death after torture in 1527; Hubmaier was burned in 1528 and Blaurock in 1529, and Sebastian Franck (1490–1542) asserts that the number of slain was in 1530 already about 2000.

Two results followed from this persecution. First, the development of a self-contained and homogeneous community was made impossible. No opportunity for the adoption of any common confession was given. Only a few great doctrines are seen to have been generally held by Anabaptists—such as the baptism of believers only, the rejection of the Lutheran doctrine of justification by faith as one-sided and the simple practice of the breaking of bread. This last, the Anabaptist doctrine of the Lord’s Supper, was to the effect that brothers and sisters in Christ should partake in remembrance of the death of Christ, and that they should thereby renew the bond of brotherly love as the basis of neighbourly life. In the second place, the persecution deprived the Anabaptists of the noble leaders who had preached non-resistance and at the same time provoked others to an attitude of vengeance which culminated in the horrors of Müns ter. For Melchior Hofmann (ca. 1490–1543 or 1544) having taken the Anabaptist teaching to Holland, there arose in Holland a brother of vengeance. Jan Matthiason or Matthysson (Matthys) (d. 1534) by name, who, prophesying a speedy end of the world and establishment of the kingdom of heaven, obtained many adherents, and despatched Boekebinder and de Knipe to Müns ter. Here the attempt was made to realise Matthiason’s ideals. All who did not embrace Anabaptist were driven from Müns ter (1533), and Bernt Knippersdalling (ca. 1495–1536) became burgomaster. The town was not long agaged anathesized, and in 1534 John (Johann Bockelson) of Leiden (1510–1536) took his place and the town became the scene of the grossest licence and cruelty, until in 1535 it was taken by the besieging bishop. Unhappily the Anabaptists have always been remembered by the crimes of John of Leiden and the revery of Müns ter. They should really be known by the teaching and martyrdom of Blaurock, Grebel and Hubmaier, and by the gentle learning and piety of Hans Denck—of whom, with many hundred other, “the world was not worthy.”

For the teaching of the Anabaptists, see Anabaptists.

Reference has already been made to the reason why a common Anabaptist confession was never made public. Probably, however, the earliest confession of faith of any Baptist community is that given by Zwingli in the second part of his Briefcha contra Catabaptistas, published in 1527. Zwingli professes to give it entire, translating it, as he says, ad verbum into Latin. Whatever opinion may be held as to the orthodoxy of the seven articles of the Anabaptists, the veneration with which they were opposed, and the epithets of abuse which were heaped upon the unfortunate sect that maintained them, cannot fail to astonish those used to toleration. Zwingli, who details these articles, as he says, that the world may see that they are “fanatical, stolid, audacious, impious,” can scarcely be acquitted of unfairness in joining together two of them,—the fourth and fifth,—thus making the article treat “of the avoiding of abominable pastors in the church” (Super devestatione abominantium pastorum in Ecclesia), though there is nothing about pastors in the fourth article, and nothing about abominations in the fifth, and though in a marginal note he himself explains that the first two copies that were sent him read as he does, but the other copies make two articles, as in fact they evidently are. It is strange that the Protestant Council of Zürich, which had scarcely won its own liberty, and was still in dread of the persecution of the Romanists, should pass the decree which instituted the cruel persecution of the Anabaptists. After Münster had fallen the harassed remnant of the Anabaptists were gathered together under Menno Simons, who joined them in 1537. His moderation and piety held in check the turbulence of the more fanatical amongst them. He died in 1561 after a life passed amidst continual dangers and conflicts. His name remains as the designation of the Mennonites (m.n.), who eventually settled in the Netherlands under the protection of William the Silent, prince of Orange.

Of the introduction of Anabaptist views into England we have already written. And at the time of the “the registers of London make mention of certain Dutchmen counted for Anabaptists, of whom ten were put to death in sundry places in the realm, anno 1535; other ten repented and were saved.” In 1536 King Henry VIII. issued a proclamation together with articles concerning faith agreed upon by Convocation, in which the clergy are told to instruct the people that they ought to repute and take “the Anabaptists’ opinions for detestable heresies and to be utterly condemned.” Thomas Fuller (1608–1661) tells us from Stow’s Chronicles that, in the year 1538, “four Anabaptists, three men and one woman, all Dutch, bare faggots at Paul’s Cross, and three days after a man and woman of their sect was burnt in Smithfield.” In the reign of Edward VI., after the return of the exiles from Zürich, John Hooper (bishop of Gloucester and Worcester, d. 1555) writes to his friend Bullinger in 1549, that he reads “a public lecture twice in the day to so numerous an audience that the church cannot contain them,” and adds, “the Anabaptists flock to the place and give me much trouble.” It would seem that at this time they were united together in communities separate from the established Church. Latimer, in 1552, speaks of them as segregating themselves from the company of other sects. In the sixth examination of John Philpot (1516–1555) in 1555 we are told that Lord Riche said to him, “All heretics do boast of the Spirit of God, and every one would have a church by himself, as Joan of Kent and the Anabaptists.” Philpot was imprisoned.
soon after Mary’s accession in 1553; and it is very pleasing to find, amidst the records of immense bitterness and rancour which characterized these times, and with which Romanist and Protestant alike assailed the persecuted Anabaptists, a letter of Philip’s, to a friend of his, “prisoner the same time in Newgate,” who held the condemned opinions. His friend had written to ask his judgment concerning the baptism of infants. Philip in a long reply, whilst maintaining the obligation of infant baptism, yet addresses his correspondent as, “dear brother, saint, and fellow-prisoner for the truth of Christ’s gospel”; and at the close of his argument he says, “I beseech thee, dear brother in the gospel, follow the steps of the faith of the glorious martyrs in the primitive church, and of such as at this day follow the same.”

Many Anabaptist communities existed in England toward the end of the 16th century, particularly in East Anglia, Kent and London. Their most notable representative was Robert Coke, but they were more notorious for heretical views as to the Virgin Mary (see ANABAPTISTS) than for their anti-pedobaptist position. It was for these views that Joan Boucher of Kent was burnt in 1550. There is no doubt that these prepared the way for the coming of the modern Baptists, but “the truth is that, while the Anabaptists in England raised the question of baptism, they were almost entirely a foreign importation, an alien element; and the rise of the Baptist churches was wholly independent of them.”

II. THE MODERN BAPTISTS

1. Great Britain and Ireland.—If the Anabaptists of England were not the progenitors of the modern Baptist church, we must look abroad for the beginnings of that movement. Although there were doubtless many who held Baptist views scattered among the Independent communities, it was not until the time of John Smith or Smyth (d. 1612) that the modern Baptist movement in England broke away from Brownism. Smyth was appointed preacher of the city of Lincoln in 1600 as an ordained clergyman, but, having a different outlook, was expelled after, emigrated under stress of persecution with the Gainsborough Independents to Amsterdam. With Thomas Helwys (ca. 1560–ca. 1616) and Morton he joined the “Ancient” church there, but, coming under Mennonite teaching in 1609, he separated from the Independents, baptized himself (hence he is called the “Se-baptist”), Helwys and others probably according to the Anabaptist or Mennonite fashion of pouring. These then formed the first English Baptist Church which in 1611 published “a declaration of faith of English people remaining at Amsterdam in Holland.” The article relating to baptism is as follows:— “That every church is to receive in all their members by baptism upon the confession of their faith and sins, wrought by the preaching of the gospel according to the primitive institution and practice. And therefore churches constituted after any other manner, or of any other persons, are not according to Christ’s testament. That baptism or washing with water is the outward manifestation of dying unto the old man, and rising in newness of life, and therefore in no wise appertaineth to infants.” They held “that no church ought to challenge any prerogative over any other”; and that “the magistrate is not to meddle with religion, or matters of conscience, nor compel men to this or that form of religion.” This is the first known expression of absolute liberty of conscience in any confession of faith.

Smyth died in Holland, but in 1612 Helwys returned to England with his church and formed the first Baptist church worshipping on English soil. The church met in Newgate Street, London, and was the origin of the “General” Baptist denomination. Helwys and his followers were Arminians, repudiating with heat the Calvinistic doctrine of predestination. They thus differed from other Independents. They also differed on the power of the magistrate in matters of belief and conscience. It was, in short, from their little dingy meeting house that there, in short, but, first in England, the absolute doctrine of Religious Liberty (Prof. Masson), Leonard Bussher, the author of “Religious Peace: or A Plea for Liberty of Conscience,” was a member of this church.

The next great event in the history of the Baptists (though it should be mentioned that the last execution for heresy in England by burning was that of Baptist Edward Wightman, at Lichfield 1612) is the rise of the first Calvinistic or “Paragragh” Baptist Church. This was the Jacob church in Southwark, which numbered among its members John Lothrop or Latriop (d. 1653), Praise-God Barbon (ca. 1596–1670), Henry Jessy (1601–1663), Harsend Knollys (ca. 1599–1691) and William Kiffin (1616–1701). It was originally Independent but then became Baptist. From this six other churches sprang, five of which were Baptist. Before the Jacob church, however, had itself become Baptist, it dismissed from its membership a group of its members (the church having grown beyond what was regarded as proper limits) who, in 1633, became the first Particular Baptist Church.

Thus there were now in existence in England two sets of Baptists whose origins were quite distinct and who never had any real interchange as churches. They differed in many respects. The General Baptists were Arminian, owing to the influence of the Mennonite Anabaptists. The Particular Baptists were Calvinist, springing as they did from the Independents. But on the question of Baptism both groups, while the latter required the baptism of infants, were as yet unpledged to immersion and rarely practised it. The development of their doctrine as to baptism was marked along three lines of dispute:— (1) who is the proper administrator of baptism? (2) who are the proper subjects? and (3) what is the proper mode? Eventually agreement was reached, and in 1644 a Confession of Faith was published in the names of the Particular Baptist churches of London, now grown to seven, “commonly (though falsely) called Anabaptist.” The article on baptism is as follows:— “That baptism is an ordinance of the New Testament given by Christ to be dispensed only upon persons professing faith, or that are disciples, or taught, who, upon a profession of faith, ought to be baptized.” “The way and manner of dispensing this ordinance the Scripture holds out to be dipping or plunging the whole body under water.” “This mode of baptism is particularly in order that they may avoid the charge of being Anabaptists, that is, either that they be an ordinance of God,” which they are bound to obey. They speak of the “breathing time” which they have had of late, and their hope that God would, as they say, “incline the magistrates’ hearts so far as to tender our consciences as that we might be protected by them from wrong, injury, oppression and molestation”; and then they proceed:— “But if God withhould the magistrates’ allowance and furtherance herein, yet we must, notwithstanding, proceed together in Christian communion, not daring to give place to suspend our practice, but to walk in obedience to Christ in the profession and holding forth this faith before mentioned, even in the midst of all trials and afflictions, not accounting our goods, lands, wives, children, fathers, mothers, brethren, sisters, yea, and our own lives, dear unto us, so that we may finish our course with joy; remembering always that we ought to obey God rather than men.” They end their confession thus:— “If any that we have been herein do with the apostle freely confess, that after the way which they call heresy, we worship the God of our fathers, believing all things which are written in the Law and in the Prophets and Apostles, desiring from our souls to disclaim all heresies and opinions which are not after Christ, and to be stedfast, unmoving, always abounding in the work of the Lord, as knowing our labour shall not be in vain in the Lord.” The “breathing time” was not of long continuance. Soon after the Restoration (1660) the meetings of nonconformists were continually disturbed and preachers were fined or imprisoned. One instance of these persecutions will, perhaps, be more impressive than any general statements. In the records of the Broadmead Baptist Church, Bristol, we find this remark:— “On the 29th of November 1685 our pastor, Brother Fownes, died in Gloucester jail, having been kept there for two years and about nine months a prisoner, unjustly and maliciously, for the testimony of Jesus and preaching the gospel. He was a man of great learning, of a sound judgment, an able preacher, having ‘great knowledge in divinity, law, physic, &c.; a bold and patient sufferer for the Lord Jesus and the gospel he preached.’"
BAPTISTS

With the Revolution of 1688, and the passing of the Act of Toleration in 1689, the history of the persecution of Baptists, as well as of other Protestant dissenters, ends. The removal of the remaining disabilities, such as those imposed by the Test and Corporation Acts repealed in 1688, has no special bearing on Baptists more than on other nonconformists. The ministers of the “three denominations of dissenters”—Presbyterians, Independents and Baptists, resident in London and the neighbourhood, had the privilege accorded to them of presenting on proper occasions an address to the sovereign in state, a privilege which they still enjoy under the name of “the General Body of Protestant Dissenting Ministers of the three Denominations.” The “General Body” was not organized until 1727.

The Baptists, having had a double origin, continued for many years in two sections—those who in accordance with Arminian views held the doctrine of “General Redemption,” and those who, agreeing with the Calvinistic theory, held the doctrine of “Particular Redemption”; and hence they were known respectively as General Baptists and Particular Baptists. In the 18th century many of the General Baptists gradually adopted the Arian, or, perhaps, the Socinian theory; whilst, on the other hand, some of the Calvinistic Baptists in the larger cities of the churches became more rigid, and approached or actually became Antinomians. In 1770 the orthodox portion of the General Baptists, mainly under the influence of Dan Taylor (b. 1738), formed themselves into a separate association, under the name of the General Baptist New Connection, since which time the “Old Connection” has gradually merged into the Unitarian denomination. By the beginning of the 19th century the New Connection numbered 40 churches and 3400 members. The Old General Baptists “still keep up a shadowy legal existence.”

Toward the end of the 18th century many of the Particular Baptist churches became more moderate in their Calvinism, a result largely attributable to the writings of Andrew Fuller. Up to this time a great majority of the Baptists admitted none either to membership or communion who were not baptized, the principal exception being the churches in Bedfordshire and Hertfordshire, founded or influenced by Bunyan, who maintained that no differentiation of persons in respect to who was baptized was a bar to communion. At the beginning of the 19th century this question was the occasion of great and long-continued discussion, in which the celebrated Robert Hall (1764–1831) took a principal part. The practice of mixed communion gradually spread in the denomination. Still more recently many Baptist churches have considered it right to admit to full membership persons professing faith in Christ, who do not agree with them respecting the ordinance of baptism. Such churches justify their practice on the grounds that they ought to grant to all their fellow-Christians the same right of private judgment as they claim for themselves. It may not be out of place here to correct the mistake, which is by no means uncommon, that the terms Particular and General as applied to Baptist congregations were intended to express this difference in their practice, whereas these terms related, as has been already said, to the difference in their doctrinal views. The difference now under consideration is expressed, not by terms like “Strict” and “Open,” according as communion (or membership) is confined to those who, according to their viewpoint, are baptized.

In 1891, largely under the leadership of Dr John Clifford, a leading General Baptist, the two denominations, General and Particular, were united, there being now but one body called “The Baptist Union of Great Britain and Ireland.” This Union, however, is purely voluntary, and some Baptist churches, a few of them prosperous and powerful, hold aloof from their sister churches so far as organization is concerned.

There are other Baptist bodies outside the Baptist Union beside certain isolated churches. Throughout England there are many “Metropolitan Baptist churches which really form a separate denomination. For the most part they are linked together according to geographical distribution in associations, such as the “Metropolitan Association of Strict Baptist Churches,” and the “Suffolk and Norfolk Association of Particular Baptist Churches.” In the latter case the name “Particular” is preferred, but the association is a union of strict Baptist churches because its principles are “strict.”

There is, however, no national Union. Indeed, the strict Baptists are themselves divided into the “Standard” and “Vessel” parties—names derived from the “Gospel Standard” and “Earthly Vessel,” the organs of the rival groups.

The general characteristic of the strict Baptist is his rigorous adherence to a type of Calvinistic theology now generally obsolete, and his insistence upon baptism as the condition of Christian communion. Their loose organization makes it impossible to obtain accurate statistics, and the smallness of the churches makes it difficult to collect any information at all.
the unity and virility of the denomination. A still stronger evidence to the same effect was given by the Religious Census taken in 1904. While this only applied to London, its results are valuable as showing the comparative strength of the Baptist Church. These results are to the effect that in all respects the Baptists came second to the Anglicans in the following three particulars:—(1) Percentage of attendances at public worship contributed by Baptists, 40-81 (London County), 10-70 (Greater London); (2) aggregate of attendances, 54,997; (3) number of places of worship, 443.

2. The Continent of Europe.—During the 19th century what we have called the modern Baptist movement made its appearance in nearly every European country. In Roman Catholic countries Baptist churches were formed by missionaries coming from either England or America: work in France began in 1832, in Italy missions were started in 1866 (Spezia Mission) and in 1884 (Baptist Missionary Society, which also has a mission in Brittany), and in Spain in 1888. In Protestant countries and in Russia the Baptist movement began without missionary intervention from England or America. J. G. Oncken (1800-1884) formed the first church in Hamburg in 1834, and thereafter Baptist churches were formed in other countries as follows:—

Denmark (1839), Holland and Sweden (1848), Switzerland (1849), Norway (1860), Austria and Rumania (1869), Hungary (1871), and Bulgaria (1884). Baptist churches also began to be formed in Russia and Finland in the 'sixties and 'seventies.

3. British Colonies.—In every colony the Baptists have a considerable place. There are unions of Baptist churches in the following colonies:—New South Wales, Victoria, S. Australia, Western Australia, Queensland, New Zealand, Tasmania, Canada (four Unions) and S. Africa. The work in S. Africa is assisted by the Baptist South African Missionary and Colonial Aid Society, having its seat in London.

The Baptist World Alliance was formed in 1905, when the first Baptist World Congress was held in London. The preamble of the constitution of this Alliance sufficiently indicates its nature:—

"Whereas, in the providence of God, the time has come when it seems fitting more fully to manifest the essential oneness in the Lord Jesus Christ, as their God and Saviour, of the churches of the Baptist order and faith throughout the world, and to promote the spirit of fellowship, service and co-operation among them, while recognizing the independence of each particular church and not assuming the functions of any existing organization, it is agreed to form a Baptist alliance, extending over every part of the world." This alliance does in fact include Baptists in every quarter of the globe, as will be seen from the following statistics:—

Total                                             | 72,681    | 7,454,165 |

In 1900 the comparable totals were roughly:—72,988 churches; 7,480,940 members. In both sets of figures the Disciples of Christ (U.S.A.) are included.

United States of America.—The first Baptist Church in America was that founded in the Providence settlement on Narragansett Bay under the leadership of Roger Williams (c. 1635). Having been sentenced to banishment (October 1635) by the Massachusetts Court because of his persistence in advocating separatistic views deemed unsettling and dangerous, to escape deportation to England he betook himself (January 1636) to the wilderness, where he was hospitably entertained by the natives who gave him a tract of land for a settlement. Having been joined by a few friends from Massachusetts, Williams founded a commonwealth in which absolute religious liberty was combined with civil democracy. In the firm conviction that churches of Christ should be made up exclusively of regenerate members, the baptism of infants appeared to him not only valueless but a perversion of a Christian ordinance. About March 1639, with eleven others, he decided to restore believers' baptism and to form a church of baptized believers.

Ezekiel Holliman, who had been with him at Plymouth and shared his separatist views, first baptized Williams and Williams baptized the rest of the company. Williams did not long continue to find satisfaction in the step he had taken. Believing that the ordinances and apostolic church organization had been lost in the general apostasy, he became convinced that it was presumptuous for any man or company of men to undertake their restoration without a special divine commission. He felt compelled to withdraw from the church and to assume the position of a seeker. He continued on friendly terms with the Baptists of Providence, and in his writings he expressed the conviction that their practice came nearer than that of other communities to the first practice of Christ.

In November 1637 John Clarke (1600-1679), a physician, of religious zeal and theological acumen, arrived at Boston, where, instead of the religious freedom he was seeking, he found the dominant party in the Antinomian controversy on the point of banishing him. Clarke sought the Antinomian minister, including Mr. Anne Hutchinson (q.v.) and her family, John Wheelwright (c. 1597-1659), and William Coddington (1601-1678). Whether from sympathy with the persecuted or aversion to the persecutors, he cast in his lot with the former and after two unsuccessful attempts at settlement assisted the fugitives in forming a colony on the island of Aquidneck (Rhode Island), procured from the Indians through the good offices of Williams. By 1641 there were, according to John Winthrop, "professed Anabaptists" on the island, and Clarke was probably their leader. Robert Lenthal, who joined the Newport company in 1640 when driven from Massachusetts, probably brought with him antiapostol tricks. Mrs. Scott, sister of Mrs. Hutchinson, is thought to have been an aggressive antiapostol when the colony was founded. Mark Luars, who was baptized by immersion in London in January 1642 (N.S.) and was a member of a Baptist church there, reached Newport about 1644. A few years later we find
him associated with Clarke as one of the most active members of the Newport church, and as the date of the organization is uncertain, there is some reason to suspect that he was a constituent member, and that as a baptized man he took the initiative in baptizing and organizing. At any rate we have in Lucar an interesting and connecting link between early English and American Baptists.

The Providence church maintained a rather feeble existence after Williams's withdrawal, with Thomas Olney (d. 1682), William Wickenden, Chad Brown (d. 1665) and Gregory Dexter as leading members. A schism occurred in 1652, the last three with a majority of the members contending for general redemption and for the laying on of hands as indispensable to fellowship, Olney, with the minority, maintaining particular redemption and rejecting the laying on of hands as an ordinance. Olney's party became extinct soon after his death in 1682. The surviving church became involved in Socinianism and Universalism, but maintained a somewhat vigorous life and, through Wickenden and others, exerted considerable influence at Newport, in Connecticut, New York and elsewhere. Dexter became, with Williams and Clarke, a leading statesman in Rhode Island and Providence Plantations.

The Newport church extended its influence into Massachusetts, and in 1649 we find a group of Baptists at Rehoboth, with Obadiah Holmes as leader. The intolerance of the authorities rendered the prosecution of the work impracticable and these Massachusetts Baptists became members of the Newport church.

In 1651 Clarke, Holmes and Joseph Cranall of the Newport church made a religious visit to Lynn, Mass. While holding a meeting in a private house they were arrested and were compelled to attend the church services of the standing order. For holding an unlawful meeting and refusing to participate quietly in the public service they were fined, imprisoned and otherwise maltreated. While in England on public business in 1652, Clarke published Ill News from New England, which contained an impressive account of the proceedings against himself and others at Lynn, and an earnest and well-reasoned plea for liberty of conscience.

Henry Dunster (1612-1659), the first president of the college at Cambridge (Harvard), had by 1655 become convinced that “visible believers only should be baptized.” Being unwilling to hold his views in abeyance, he relinquished in 1654, under circumstances of considerable hardship, the work that he greatly loved. In 1663 John Myles (1621-1683), a Welsh Baptist who had been one of Cromwell's Tryers, with his congregation, took refuge in Massachusetts from the intolerance of the government of Charles II. They were allowed to settle in Rehoboth, Mass., and even after they were discovered to be Baptists were allowed to remain on condition of establishing their meetingplace at a considerable distance from that of the standing order. Myles did much to promote the growth of the Baptist Church in Massachusetts, and was of service to the denomination in Boston and elsewhere. Thomas Goul, of Charlestown, seems to have been in close touch with President Dunster and to have shared his antipaedobaptist views as early as 1654. Some time before 1665 several English Baptists had settled in the neighbourhood of Boston and several others had adopted Baptist views. These, with Gould, were baptized (May 1665) and joined with those who had been baptized in England in a church covenant. The church was severely persecuted, the members being frequently imprisoned and fined and denied the use of a building they had erected as a meeting-house.

Long after the Act of Toleration (1689) was in full force in England, the Boston Baptists pleaded in vain for the privileges to which they were thereby entitled, and it required the most earnest efforts of English Baptists and other dissenters to gain for them a recognition of the right to exist. A mandate from Charles II. (July 1679), in which the Massachusetts authorities were sharply rebuked for denying to others the liberty to secure which they themselves had gone into exile, had produced little effect.

In 1685 William Screven (1620-1713) and Humphrey Churchwood, members of the Boston church, gathered and organized, with the co-operation of the mother church, a small congregation at Kittery, Me. Persecution led to migration, Screven and some of the members making their way to South Carolina, where, with a number of English Baptists of wealth and position, what became the First Baptist church in Charleston, was organized (about 1684). This became one of the most important of early Baptist centres, and through Screven's efforts Baptist principles became widely disseminated throughout that region. The withdrawal of members to form other churches in the neighbourhood and the intrusion of Socinianism almost extinguished the Charleston church about 1746.

A few Baptists of the general (Arminian) type appeared in Virginia from 1714 onward, and were organized and fostered by missionaries from the English General Baptists. By 1777 they had invaded North Carolina and a church was established there.

From 1643 onward antipaedobaptists from New England and elsewhere had settled in the New Netherlands (New York). Mrs Deborah Moody left Massachusetts for the New Netherlands in 1643 because of her antipaedobaptist views and on her way stopped at New Haven, where she won to her principles Mrs Eaton, the wife of the governor, Theophilus Eaton. She settled at Gravesend (now part of Brooklyn) having received from the Dutch authorities a guarantee of religious liberty. Francis Doughty, an English Baptist, who had spent some time in Rhode Island, laboured in this region in 1656 and baptized a number of converts. This latter proceeding led to his banishment. Later in the same year William Wickenden of Providence evangelized and administered the ordinances at Flushing, but was heavily fined and banished. From 1711 onward Valentine Wightman (1681-1747) of Connecticut (General Baptist) made occasional missionary visits to New York at the invitation of Nicolas Eyres, a business man who had adopted Baptist views, and in 1714 baptized Eyres and several others, and assisted them in organizing a church. The church was well-nigh wrecked (1730) by debt incurred in the erection of a meeting-house. A number of Baptists settled on Block Island about 1655. Some time after 1684 a Baptist church (probably Arminian) was formed at Oyster Bay.

The Quaker colonies, with their large measure of religious liberty, early attracted a considerable number of Baptists from New England, England and Wales. About 1684 a Baptist church was founded at Cold Spring, Bucks county, Pa., through the efforts of Thomas Dungan, an Irish Baptist minister who had spent some time in Rhode Island. The Pennepek church was formed in 1688 through the labours of Elias Kach, son of Benjamin Keach (1640-1704), the famous English evangelist. Services were held in Philadelphia under the auspices of the Pennepek church from 1687 onward, but independent organization did not occur until 1698. Several Keithian Quakers united with the church, which ultimately became possessed of the Keithian meeting-house. Almost from the beginning general meetings had been held by the churches of these colonies. In 1714 Philadelphia was visited as a delegated body "to consult about such things as were wasting in the churches and to set them in order." From its inception this body proved highly influential in promoting Baptist co-operation in missionary and educational work, in efforts to supply the churches with suitable ministers and to silence unworthy ones, and in maintaining sound doctrine. Sabbatarianism appeared within the bounds of the association at an early date and Seventh-Day Baptist churches were formed (1705 onward).

The decades preceding the "Great Awakening" of 1740-1743 were a time of religious declension. A Socinianized Arminianism had paralysed evangelistic effort. The First Church, Providence, had long since become Arminian and held aloof from the evangelism of Edwards, Whitefield and their coadjutors. The First Church, Boston, had become Socinianized and discountenanced the revival. The First Church, Newport, had been rent asunder by Arminianism, and the nominally Calvinistic remnant had itself become divided on the question of the laying on of hands and showed no sympathy with the Great Awakening. The First Church, Charleston, had been wrecked by Socinianism. The General (Six Principles) Baptists of Rhode Island and
Connecticut had increased its congregations and membership, and before the beginning of the 18th century had inaugurated annual associational meetings. But the fact that the Great Awakening in America was conducted on Calvinistic principles was sufficient to prevent their hearty co-operation. The churches of the Philadelphia Association were organized and engaged to some extent in missionary endeavour, but they showed little interest in the Edwards-Whitefield movement. And yet the Baptists ultimately profited by the Great Awakening beyond almost any of the denominations. In many New England communities a majority in the churches of the standing order bitterly opposed the new evangelism, and those who came under its influence felt constrained to organize “Separate” or “New Light” churches. These were severely persecuted by the dominant party and were denied even the scanty privileges that Baptists had succeeded in gaining. As the chief objection of the “Separates” to the churches of the standing order was their refusal to insist on personal regeneration as a term of membership, many of them were led to feel that they were inconsistent in requiring regenerate membership and yet administering baptism to unconscious infants. In several cases entire “Separate” churches reached the conviction that this was not only without Scriptural warrant but was a chief corner-stone of state-churchism, and transformed themselves into Baptist churches. In many cases a division of sentiment came to prevail on the matter of infant-baptism, and for a while mutual toleration prevailed; but mixed churches had their manifest disadvantages and separation ultimately ensued.

Among the Baptist leaders gained from Congregationalism as a result of the awakening was Isaac Backus (1724-1806), who became the New England champion in the cause of religious liberty and equality, and the historian of his denomination. To Daniel Marshall (d. 1784) and Shubael Stearns, “New Light” evangelists who became Baptists, the spread of Baptist principles and the multiplication of Baptist churches throughout the southern colonies were in great measure due. The feeble Baptist cause in Virginia and North Carolina had been considerably strengthened by missionaries from the churches of the Philadelphia Association, including Benjamin Griffith, John Gano (1727-1804), John Thomas, Benjamin Miller, Samuel Eaton, John Garrard, and David Thomas, and several churches, formed or reformed under their influence, united with the association. In 1776 the Kecoughton Association was formed by this group of churches. The Virginia colonial government, in earlier days cruelly intolerant, gave a limited toleration to Baptists of this type; but the “Separate” Baptists were too enthusiastic and too much alive to the evils of state control in religious matters to be willing to take out licences for their meetings, and soon came into sharp conflict with the authorities. Stearns was an evangelist of great power. With Marshall, his brother-in-law, and about a dozen fellow-believers he settled at Sandy Creek, North Carolina, and in a few years had built up a church with a membership of more than six hundred. Marshall afterward organized and ministered to a church at Abbott’s Creek about 30 m. distant. From these centers “Separate” Baptist influence spread throughout North and South Carolina and across the Georgia border; Marshall himself finally settling and forming a church at Kiokee, Georgia. From North Carolina as a centre “Separate” Baptist influence permeated Virginia and extended into Kentucky and Tennessee. The Sandy Creek Association came to embrace churches in several colonies, and Stearns, desirous of preserving the harmonious working of the churches that recognized his leadership, resisted with vehemence all proposals for the formation of other associations.

From 1760 to 1770 the growth of the “Separate” Baptist body in Virginia and the Carolinas was phenomenal. Evangelists like Samuel Harris (1724-1794) and John Waller (1741-1802) stirred whole communities and established Baptist churches where the Baptist name had hitherto been unknown. The Sandy Creek Association, with Stearns as leader, undertook to “unfellowship ordinations, ministers and churches that acted independently,” and provoked such opposition that a division of the association became necessary. The General Association of Virginia and the Congaree Association of South Carolina now took their places side by side with the Sandy Creek. The Virginia “Separate” Baptists had more than doubled their numbers in the two years from May 1771 to May 1773. In 1774 some of the Virginia brethren became convinced that the apostolic office was meant to be perpetuated and induced the association to appoint an apostle. Samuel Harris was the unanimous choice and was solemnly ordained. Waller and Elijah Craig (1743-1800) were made apostles soon afterward for the northern district. This arrangement, soon abandoned, was no doubt suggested by Methodist superintendence. In 1775 Methodist influence appeared in the contention of two of the apostles and Jeremiah Walker for universal redemption. Schism was narrowly averted by conciliatory statements on both sides. As a means of preserving harmony the Philadelphia Confession of Faith, a Calvinistic document, with provision against too rigid a construction, was adopted and a step was thus taken toward harmonizing with the “Regular” Baptists of the Philadelphia type. When the General Association was subdivided (1783), a General Committee, made up of delegates from each district association, was constituted to consider matters that might arise for the good of the work. This body was to continue the agitation in which for some years the body had been successfully engaged in favour of religious equality and the entire separation of church and state. Since 1780 the “Separate” Baptists had had the hearty co-operation of the “Regular” Baptists in their struggle for religious liberty and equality. In 1787 the two bodies united and agreed to drop the names “Separate” and “Regular.” The success of the Baptists of Virginia in securing step by step the abolition of everything that savoured of religious oppression, involving at last the disestablishment and the disendowment of the Episcopal Church, was due in part to the fact that Virginia Baptists were among the foremost advocates of American independence, while the Episcopal clergy were loyalists and had made themselves obnoxious to the people by using the authority of Great Britain in extorting their tithes from unwilling parishioners, and that they secured the co-operation of free-thinking statesmen like Thomas Jefferson and James Madison and, in most measures, that of the Presbyterians.

The Baptist cause in New England that had profited so largely from the Great Awakening failed to reap a like harvest from the War of Independence. The standing order in New England represented the patriotic and popular party. Baptists lost favour by threatening to appeal to England for a redress of their grievances at the very time when resistance to English oppression was being determined upon. The result was slowness of growth and failure to secure religious liberty. Though a large proportion of the New England Baptists co-operated heartily in the cause of independence, the denomination failed to win the popularity that comes from successful leadership.

About 1762 the Philadelphia Association began to plan for the establishment of a Baptist institution of learning that should serve the entire denomination. Rhode Island was finally fixed upon, partly as the abode of religious liberty and because of its intelligent, influential and relatively wealthy Baptist constituency, the consequent likelihood of procuring a charter from the legislature, and the probability that the co-operation of other denominations in an institution under Baptist control would be available. James Manning (1738-1791), who had just been graduated from Princeton with high honours, was thought of as a suitable leader in the enterprise, and was sent to Rhode Island (1763) to confer with leading men, Baptist and other. As a result a charter was granted by the legislature in 1764, and after a few years of preliminary work at Warren (where the first degrees ever bestowed by a Baptist institution were conferred in 1760), Providence was chosen as the home of the college (1770). Here, with Manning as president and Hezekiah Smith (1737-1805), his class-mate at Princeton, as financial agent and influential supporter, the institution (since 1804 known as Brown University) was for many years the only degree-conferring
BAPTISTS

institution controlled by Baptists. The Warren Association (1767) was organized under the influence of Manning and Smith on the model of the Philadelphia, and became a chief agency for the consolidation of denominational life, the promotion of denominational education and the securing of religious liberty. Hezekiah Smith was a highly successful evangelist, and through his labours scores of churches were constituted in New England. As chaplain in the American Revolutionary Army he also exerted a widespread influence.

The First Church, Charleston, which had become almost extinct through Arminianism in 1746, entered upon a career of remarkable prosperity in 1749 under the leadership of Oliver Hart (1723-1795), formerly of the Philadelphia Association. In 1753 the Charleston Association was formed, also on the model of the Philadelphia, and proved an element of denominational strength. The association raised funds for domestic missionary work (1755 onward) and for the education of ministers (1756 onward). Brown University shared largely in the liberality of members of this highly-cultivated and progressive body. Among the beneficiaries of the education fund was Samuel Stillman (1737-1807), afterward the honoured pastor of the Boston church. The most noted leader of the Baptists of South Carolina during the four decades following the War of Independence was Richard Furman (1725-1825), pastor of the First Church, Charleston. The remarkable numerical progress of Baptists in South Carolina from 1787 to 1812 (from 1620 members to 11,325) was due to the "Separate" Baptist movement under Stearns and Marshall far more than to the activity of the churches of the Charleston Association. Both these types of Baptist life permeated Georgia, the latter making its influence felt in Savannah, Augusta and the more cultivated communities, the former evangelizing the masses. Many negro slaves became Baptists in Virginia, the Carolinas and Georgia. In most cases they became members of the churches of the white Baptists; but in Richmond, Savannah and some other towns they were encouraged to have churches of their own.

By 1845 there were in the United States 173,072 Baptist church members, the denominational numerical strength having considerably more than doubled since the beginning of the 19th century.

Foreign Missions.—Baptists in Boston and vicinity, Philadelphia and Charleston, and a few other communities had from the beginning of the 19th century taken a deep interest in the missionary work of William Carey, the English missionary, and his coadjutors in India, and had contributed liberally to its support. The conversion to Baptist views of Adoniram Judson (q.v.) and Luther Rice (1812), who had just been sent, with others, by the newly-formed American Board of Commissioners for Foreign Missions to open up missionary work in India, marks an epoch in American Baptist history. Judson appealed to his American brethren to support him in missionary work among the heathen, and Rice returned to America to organize missionary societies to awaken interest in Judson's mission. In January 1815 there was formed in Boston "The Baptist Society for the Propagation of the Gospel in India and Other Foreign Parts." Other societies in the Eastern, Middle and Southern states speedily followed. The desirability of a national organization soon became manifest, and in May 1815 thirty-three delegates representing eleven states, met in Philadelphia and organized the "General Missionary Convention of the Baptist Denomination in the United States of America for Foreign Missions." As its meetings were to be held every three years it came to be known as the "Triennial Convention." A Board of Commissioners was appointed with headquarters in Philadelphia (transferred in 1826 to Boston). The need of a larger supply of educated ministers for home and for mission work alike soon became too profoundly felt, and resulted in the establishment of Columbian College, Washington (now George Washington University), with its theological department (1821), intended to be a national Baptist institution. Destitution on the frontier led the Triennial Convention to engage extensively in home mission work (1817 onward), and in 1832 the American Baptist Home Mission Society was constituted for the promotion of this work. The need of an organ for the dissemination of information, and the quickening of interest in the missionary and educational enterprises of the Triennial Convention, led Rice to establish the "Day and Columbian Star," a weekly journal (1822). From the first the attempt to arouse the denominational effort to propagate the gospel met with much opposition, agents of the Convention being looked upon by the less intelligent pastors and churches as highly-paid and irresponsible collectors of money to be used they knew not how, or for purposes of which they disapproved. The fact that Rice was unduly optimistic and allowed the enterprises of the Convention to become almost hopelessly involved in debt, and was constrained to use some of the fund collected for missions to meet the exigencies of his educational and journalistic work, intensified the hostility of those who had suspected from the beginning the good faith of the agents and denied the scriptural authority of boards, paid agents, paid missionaries, &c. So virulent became the opposition that in several states, as Tennessee and Kentucky, the work of the Convention was for years excluded, and a large mass of Southern Baptists and seemed to receive into their fellowship those who advocated or contributed to its objects. Hyper-Calvinism, ignorance and avarice cooperated in making the very name 'missions' odious, ministerial education an impertinent human effort to supplant a spirit-called and spirit-endowed ministry, Sunday-schools and prayer-meetings as human institutions, the aim of which was to interfere with the divine order, and the receiving of salaries for ministerial work as serving God for hire or rather as serving self. To counteract this influence, Baptist State Conventions were formed by the friends of missions and education, only contributing churches, associations, missionary societies and individuals being invited to membership (1821 onward—Massachusetts had effected state organization in 1802). These became highly efficient in promoting foreign and domestic missions, Sunday-school organization, denominational literature and education. Nearly every state soon had its institutions of learning, which wished to be universities.

Before 1844 the sessions of the Triennial Convention had occasionally been made unpleasant by harsh anti-slavery utterances by Northerners among the members, and a large number of Southern Baptists and seemed to receive into their fellowship those who advocated or contributed to its objects. Hyper-Calvinism, ignorance and avarice cooperated in making the very name "missions" odious, ministerial education an impertinent human effort to supplant a spirit-called and spirit-endowed ministry, Sunday-schools and prayer-meetings as human institutions, the aim of which was to interfere with the divine order, and the receiving of salaries for ministerial work as serving God for hire or rather as serving self. To counteract this influence, Baptist State Conventions were formed by the friends of missions and education, only contributing churches, associations, missionary societies and individuals being invited to membership (1821 onward—Massachusetts had effected state organization in 1802). These became highly efficient in promoting foreign and domestic missions, Sunday-school organization, denominational literature and education. Nearly every state soon had its institutions of learning, which wished to be universities.

Since 1845 Northern and Southern Baptists alike have greatly increased in numbers, in missionary work, in educational institutions and in everything that pertains to the equipment and organization of a religious denomination. Since 1812 they have increased in numbers from less than 200,000 to more than 5,000,000. In 1812 American Baptists had no theological seminary; in 1906 there were 11 theological seminaries, 1,300 students, and endowments and equipments valued at nearly $7,000,000. In 1812 they had only one degree-conferring college with a small faculty, a small student body and almost no endowment; in 1906 they had seven degree-conferring colleges and theological seminaries, with a combined endowment of more than $10,000,000, and an annual income of about $3,000,000. In 1812 the value of church property was small; in 1866 it was estimated at $100,000,000. They publish monthly periodicals with a circulation of less than 80,000 copies, and have constructed several large presses with an annual business of nearly $1,000,000 and assets of $1,750,000.

Baptists in the Dominion of Canada had their rise about the close of the 18th century in migrations from the United States. They have been reinforced by considerable numbers of English, Welsh and Scottish Baptists. They are divided into four sections:—those of the Maritime Provinces, with their Convention, their Home and Foreign Mission Boards, an Education Board and a Publication Board, and with McMaster University (Arts, Theological and
BAR

Academic departments as its educational institution; those of Manitoba and the North-West, with Brandon College as its educational institution; and those of British Columbia. Canadian Baptists numbered 120,000 in 1909, and are considered in the above general estimates.

(A. H. N.)

BAR, FRANÇOIS DE (1538-1606), French scholar, was born at Selzencourt, near St Quentin, and having studied at the University of Paris entered the order of St Benedict. He soon became prior of the abbey of Anchin, near Pecquencourt, and passed much of his time in the valuable library of the abbey, studying ecclesiastical history, especially that of Flanders. He also made a catalogue of the manuscripts at Anchin and annotated many of them. During the French Revolution his manuscripts passed to the library of Douai. Bar died at Anchin on the 25th of March 1606.

BAR, a town of Russia, in the government of Podolia, 50 m. N.E. of Kamienets, on an affluent of the Bug. Pop. (1897) 10,674. It was formerly called Rov. Its present designation was bestowed upon it in memory of Bar in Italy (where she was born) by Bona Sforza, the consort of Sigismund I. of Poland, who rebuilt the town after its destruction in 1452 by the Tatars. From 1569 to 1672 it remained in possession of the Turks. In 1756 a confederation of the Polish nobles (see next article) against the Russians was formed in the town, which was shortly after taken by storm, but did not become finally united to Russia till the partition of 1793.

BAR, CONFEDERATION OF, a famous confederation of the Polish nobles and gentry formed at the little fortress of Bar in Podolia in 1768 to defend the internal and external independance of Poland against the aggressions of the Russian government as represented by her representative at Warsaw, Prince Nicholas Repnin. The originators of this confederation were Adam Krasinski, bishop of Kamienets, Osip Pulawski and Michael Krasinski. King Stanislaus was at first inclined to mediate between the confederates and Russia; but finding this impossible, sent a force against them under the grand hetman Kasavy Branicki and two generals, who captured Bar. Nevertheless, a simultaneous outbreak of a jacquerie in Little Russia was contributed to the extension of the confederacy into the eastern province of Poland and Lithuania. The confederacy, thereupon, requested for help abroad and contributed to bring a force into Russia and Turkey. So serious indeed was the situation that Frederick II. advised Catherine to come to terms with the confederates. Their bands under Ignaty Malchewsky, Michael Pac and Prince Charles Radziwill ravaged the land in every direction, won several engagements over the Russians, and at last, utterly ignoring the king, sent envoys on their own account to the principal European powers. In 1770 the Council of the Confederation was transferred from its original seat in Silesia to Hungary, from whence it conducted diplomatic negotiations with France, Austria and Turkey with the view of forming a league against Russia. The court of Versailles sent Dumouziez to act as commander-in-chief of the confederates, but neither as a soldier nor as a politician did this adroit adventurer particularly distinguish himself, and his account of his experiences is very unfair to the confederates. Among other blunders, he pronounced King Stanislaus a tyrant and a traitor at the very moment when he was about to accede to the Confederation. The king thereupon reverted to the Russian faction and the Confederation lost the confidence of Europe. Nevertheless, its army, thoroughly reorganized by Dumouziez, gallantly maintained the case of struggle for some years, and it was not till 1773 that the last traces of it disappeared.

See Alexander Krasfjask, Prince Repnin in Poland (Pol.) (Warsaw, 1900); F. A. Thesby de Belcourt, The Confederates of Bar (Pol.) (Cracow, 1895); Charles François Dumouziez, Mémoires et correspondance (Paris, 1834).

BAR (O. Fr. barre, Late Lat. barra, origin unknown), in physical geography, a ridge of sand or silt crossing an estuary under water or raised by wave action above sea-level, forming an impediment to navigation. When a river enters a tidal sea its rate of flow is checked and the material it carries in suspension is deposited in a shifting bar crossing the channel from bank to bank. Where the channel is only partly closed, a spur of this character is called a "spit." A bar may be produced by tidal action only in an estuary or narrow gulf (as at Port Adelaide) where the tidies sweep the loose sand backwards and forwards, depositing it where the motion of the water is checked. Nahant Bay, Mass., is bordered by the ridge of Lynn Beach, which separates it from Lynn Harbor, and ties Nahant to the mainland by a bar formed in this way.

BAR, THE. This term, as equivalent to the profession of barrister (q.v.), originated in the partition or bar dividing the English law-courts into two parts, for the purpose of separating the members and officials of the court from the prisoners or suitors, their advocates and the general public. Theoretically, this division of the court is still maintained in England, though, those who are entitled to sit within the bar including king’s counsel, barristers with patents of precedence, serjeants (till the order died out) and solicitors, while the other members of the bar and the general public remain without. Parties in civil suits who appear in person are allowed to stand in the floor within the bar instead of, as formerly, appearing at the bar itself. In criminal trials the accused still remains forward at the bar. There is also a “bar” in parliament. In the House of Commons it remains literally a bar—a long brass rod hidden in a tube from which it is pulled out when required to mark the technical boundary of the House. Before it appear those who are charged with having violated the privileges of the House; below it also sit those members who have been returned at bye-elections, to await their introduction to the House and the taking of the oath of allegiance. In the House of Lords the place where Mr Speaker and the members of the House of Commons stand when summoned by Black Rod is called “the bar.”

The “call to the bar” in England, by which a law student at one of the Inns of Court is converted into a barrister, is dealt with under INNS OF COURT. The exclusive privilege of calling to the bar belongs to those bodies, which also exercise disciplinary power over their members; but it was widely felt by members of the bar in recent years that the benchers or governing body with their self-elected members did not keep a sufficiently watchful eye on the minutiae of the profession. Consequently, in 1883, a bar committee was formed with the purpose of dealing with all matters relating to the profession, such as the criticizing of proposed legal reforms and the expression of opinions on matters of professional etiquette, conduct and practice. In 1894 the committee was dissolved, and succeeded by the general council of the bar, elected on a somewhat wider basis. It is composed of a due proportion of king’s counsel and outer barristers elected by voting-papers sent to all barristers having an address in the Law List within the United Kingdom. Its expenses are paid by contributions from the four Inns of Court. Its powers are not disciplinary, but it would draw the attention of the benchers to any gross violation of the professional etiquette of the bar.

Each state in America has its own bar, consisting of all attorneys-at-law residing within it who have been admitted to practice in its courts. Generally attorneys are admitted in one court to practice in all courts. Each of the United States courts has a bar of its own. An attorney of a state cannot practise in a court of the United States unless he has been admitted to it, or to one of the same class in another district or circuit. He cannot appear in the Supreme Court of the United States unless specially admitted and sworn as a member of that court, which is done in motion in case of any one who has practised for three years in the highest courts of his state and is in good standing at its bar. In most of the states there is a state bar association, and in some cities and counties local bar associations. These consist of such members of its bar as desire thus to associate, the object being to guard and advance the standards of the profession. Some own valuable libraries. These associations have no official recognition, but their influence is considerable in
recommendng and shaping legislation respecting the judicial establishment and procedure. They also serve a useful purpose in instituting or promoting proceedings to discipline or expel unworthy attorneys from the bar. There is an American Bar Association, founded in 1878, composed of over 3500 members of different states of like character and position. Some of these associations publish annually a volume of transactions. The rights, duties and liabilities of counsellor-at-law are stated under ATTORNEY. As members of the bar of the state in which they practise they are subject to its laws regulating such practice, e.g. in some states they are forbidden to advertise for divorce cases (New York Penal Code [1902] § 148a) (1905, People v. Taylor [Colorado], 75 Pac. Rep. 914). It is common throughout the United States for lawyers to make contracts for "contingent fees," i.e. for a percentage of the amount recovered. Such contracts are not champerous and are upheld by the courts, but will be set aside if an unconscionable bargain be made with the client (Deering v. Scheer [N.Y.], 58 App. D. 322). So also by the U.S. Supreme Court (Wright v. Tebben, 91 U.S. 252; Taylor v. Benz, 110 U.S. 42). The reason for upholding such contracts is that otherwise poor persons would have no funds for securing or protecting their property or rights. In fact such contracts are seldom set aside, though no doubt the practice is carried on to abuse.

BARA BANKI, a town and district of British India in the Fyzabad division of the United Provinces. The town, which forms one municipality with Nawabganj, the administrative headquarters of the district, is 17 m. E. of Lucknow by railway. The population of Bara Banki alone in 1901 was 3020. There is some trade in sugar and cotton.

The district has an area of 1275 sq. m. It stretches out in a level plain interspersed with numerous jhils or marshes. In the upper part of the district the soil is sandy, while in the lower part it is clayey and produces finer crops. The principal rivers are the Gogra, forming the northern boundary, and the Gumi, flowing through the middle of the district. In 1856 it came, with the rest of Oudh, under British rule. During the Sepoy war of 1857-1858 the whole of the Bara Banki talukdars joined the mutineers, but offered no serious resistance after the capture of Lucknow. The cultivators are still, for the most part, tenants-at-will, rack-rented and debt-ridden. In 1901 the population was 14,179,329, showing an increase of 4% in the decade. The principal crops are rice, wheat, pulse and other food-grains, sugar-cane and opium. Both the bordering rivers are navigable; and the district is traversed by two lines of the Oudh and Rohilkhand railway, with branches. Trade in agricultural produce is active.

BARABOO, a city and the county-seat of Sauk county, Wisconsin, U.S.A., about 37 m. N.W. of Madison, on the Baraboo river, a tributary of the Wisconsin. Pop. (1890) 4069; (1900) 5751, of whom 732 were foreign-born; (1905) 6835; (1910) 6324. The city is served by the Chicago & North-Western railway, which maintains here an engine house and extensive machine shops, and of which it is a division headquarters. Baraboo has an attractive situation on a series of hills about 1000 ft. above sea-level. In the vicinity are Devil's Lake (5 m. S.) and the famous Dells of the Wisconsin river (near Kibbourn, about 12 m. N.), two summer resorts with picturesque scenery. The principal public buildings are the court-house (in a small public park), the public library and a high school. Dairying and the growing of small fruits are important industries in the surrounding region; and there is a large nursery here. Stone quarried in the vicinity is exported, and the city is near the centre of the Sauk county iron range. Among the manufactures are woolen goods, towels, canned fruit and vegetables, dairy products, beer, and circus wagons (the city is the headquarters of the Ringling and the Gollmar circuses). The first permanent settlement here was made in 1839. Baraboo was named in honour of Jean Baribault, an early French trapper, and was chartered as a city in 1882.

BARABRA, a name for the complex Nubian races of the Egyptian Sudan, whose original stock is Hamitic-Berber, long modified by negro crossings. The word is variously derived from Berberi, i.e. people of Berber, or as identical with Barabara, figuring in the inscription on a gateway of Tethmosis I. as the name of one of the 113 tribes conquered by him. In a later inscription of Rameses II. at Karnak (c. 1390 B.C.) Barabara is given as that of a southern conquered people. Thus it is suggested that Barabra is a real ethnical name, confused later with Greek and Roman barbarus, and revived in its proper meaning subsequent to the Moslem conquest. A tribe living on the banks of the Nile between Wadi Halfa and Assuan are called Barabra. (See further NUBIA.)

BARACALDO, a river-port of north-eastern Spain, in the province of Biscay, on the left bank of the river Nervion or Ansa (in Basque, Ibaizabal), 5 m. by rail N.W. of Bilbao. Pop. (1900) 15,013. Few Spanish towns have developed more rapidly than Baracaldo, which nearly doubled its population between 1880 and 1900. During this period many immigrant labourers settled here; for the ironworks and dynamite factory of Baracaldo prospered greatly, owing to the increased output of the Biscayan mines, the extension of railways in the neighbourhood, and the growth of local trade. In the 19th century the country round Baracaldo is covered with maize, pod fruit and vines.

BARACOA, a seaport city of N.E. Cuba, in Santiago province. Pop. (1907) 5633. The town lies under high hills on a small circular harbor accessible to small craft. The country round about is extremely rugged. The hill called the "Anvil of Baracoa" (about 3000 ft.) is remarkable for its extremely regular formation. It completely dominates the city's background, and is a well-known sailors' landmark. The town is the trading centre of a large plantation region behind it and is the centre of the banana and cocoanut export trade. There is a fort dating from the middle of the 18th century. Baracoa is the oldest town in Cuba, having been settled by Diego Velazquez in 1512. It held from its foundation the honours of a city. From 1512 to 1514 it was the capital of the island, and from 1518 to 1522 its church was the cathedral of the island's first diocese. Both honours were taken from it to be given to Santiago de Cuba; and for two centuries after this Baracoa remained an obscure village with but little commerce. In the 16th century it was repeatedly plundered by pirates until it came to terms with them that gave them welcome harbourage, and based a less precarious existence upon continuous illicit trade. Until the middle of the 18th century, Baracoa was almost without connexion with Havana and Santiago. In the wars of the end of the century it was a place of deposit for French and Spanish corsairs. At this time, too, about 100 fugitive immigrant families from Santo Domingo greatly augmented its industrial importance. In 1807 an unsuccessful attack was made upon the city by an English force. In 1826 the port was opened to foreign commerce.

BARAHONA DE SOTO, LUIS (1535? -1593?), Spanish poet, was born about 1535 at Lucena (Cordova), was educated at Granada, and practised as a physician at Cordova. His principal poem is the Primera parte de la Anglica (1586), a continuation of the Orlando furioso; the second part was long believed to be lost, but fragments of it have been identified in the anonymous Dialógos de la montería, first printed in 1586; the Dialógos also embody fragments of a poem by Barahona entitled Los Principios del mundo, and many graceful lyrics by the same writer have been published by Francisco Rodriguez Marin. Cervantes describes Barahona as "one of the best poets not only in Spain, but in the whole world"; this is friendly hyperbole. Nevertheless Barahona has high merits: poetic imagination, ingenious fancy, and an exceptional mastery of the methods transplanted to Spain from Italy. His Anglica has been reproduced in facsimile (New York, 1904) by Archer M. Huntington.

See F. Rodriguez Marin, Luis Barahona de Soto, estudio biográfico, bibliográfico, y crítico (Madrid, 1903); Dialógos de la montería, edited by F. R. de Uchagon (Madrid, 1890).

BARANTE, AMABLE GUILLERMO PROSPER BRUGIÉRE, BARON DE (1782-1866), French statesman and historian, the son of an advocate, was born at Riom on the 10th of June 1782. At the age of sixteen he entered the École Polytechnique at
BARASAT—BARBADOS

Paris, and at twenty obtained his first appointment in the civil service. His abilities secured him rapid promotion, and in 1806 he obtained the post of auditor to the council of state. After being employed in several political missions in Germany, Poland, and Spain, during the next two years, he became prefect of Vendée. At the time of the return of Napoleon I, he held the prefecture of Nantes, and this post he immediately resigned. On the second restoration of the Bourbons he was made councillor of state and secretary-general of the ministry of the interior. After filling for several years the post of director-general of indirect taxes, he was created in 1819 a peer of France and was prominent among the Liberals. After the revolution of July 1830, M. de Barante was appointed ambassador to Turin, and five years later to St Petersburg. Throughout the reign of Louis Philippe he remained a supporter of the government; and after the fall of the monarchy, in February 1848, he withdrew from political affairs and retired to his country seat in Avuyerne. Shortly before his retirement he had been made grand cross of the Legion of Honour. Barante’s Histoire des ducs de Bourgogne de la maison de Valois, which appeared in a series of volumes between 1824 and 1828, procured him immortality among French historians. He was appointed professor of history at the French Academy. Its narrative qualities, and purity of style, won high praise from the romantic school, but it exhibits a lack of the critical sense and of scientific scholarship. Amongst his other literary works are a Tableau de la littérature française au dix-huitième siècle, of which several editions were published; Des communes et de l’aristocratie (1821); a French translation of the dramatic works of Schiller; Questions constitutionnelles (1850); Histoire de la Convention Nationale, which appeared in six volumes between 1851 and 1853; Histoire du Directoire de la République française (1853); Études historiques et biographiques (1857); La Vie politique de M. Royer-Collard (1861). The version of Hamlet for Guiot’s Shakespeare was his work. He died on the 22nd of November 1866.

His Souvenirs were published by his grandson (Paris, 1890-99). See also the article by Guiot in the Revue des Deux Mondes, July 1867.

BARASAT, a subdivisional town in the district of the Twenty-four Parganas, Bengal, India. For a considerable time Barasat town was the headquarters of a joint magistracy, known as the “Barasat District,” but in 1861, on a readjustment of boundaries Barasat district was abolished by order of government, and was converted into a subdivision of the Twenty-four Parganas. Pop. (1901) 8634. It forms a striking illustration of the rural character of the so-called “towns” in Bengal, and is merely an agglomeration of 41 separate villages, in which all the operations of husbandry go on precisely as in the adjacent hamlets.

BARATIER, JOHANN PHILIPP (1721-1740), German scholar of precocious genius, was born at Schwabach near Nuremberg on the 10th of January 1721. His early education was most carefully conducted by his father, the pastor of the French church at Schwabach, and so rapid was his progress that by the time he was five years of age he could speak French, Latin and Dutch with ease, and read Greek fluently. He then studied Hebrew, and in three years was able to translate the Hebrew Bible into German in the presence of his father. He had collected materials for the study of the Hebrew language, and had published several works of Hebrew grammar and difficult Hebrew words, with critical and philological observations; and when he was about eleven years old translated from the Hebrew Tadela’s Itinerarium. In his fourteenth year he was admitted master of arts at Halle, and received into the Royal Academy at Berlin. The last years of his short life he devoted to the study of history and antiquities, and had collected materials for histories of the Thirty Years’ War, and of Antitrinitarianism, and for an Inquiry concerning Egyptian Antiquities. He died at the age of twenty, having been completed one year old. No remains of his manuscripts have survived to the present day.

BARATYNSKI, JEWGENIJ ABRAMOVICH (1800-1844), Russian poet, was educated at the royal school at St Petersburg and then entered the army. He served for eight years in Finland, where he composed his first poem Eda. Through the interest of friends he obtained leave from the tsar to retire from the army, and settled in 1827 near Moscow. There he completed his chief work The Gipsy, a poem written in the style of Pushkin. He died in 1844 at Naples, whither he had gone for the sake of the milder climate.

A collected edition of his poems appeared at St Petersburg, in 2 vols. in 1835; later editions, Moscow 1869, and Kazan 1884.

BARB. (1) (From Lat. barba, a beard,) a term used in various senses, of the folds of mucous membrane under the tongue of horses and cattle, and of a disease affecting that part, of the wattles round the mouth of the barbel, of the backward turned points of an arrow and of the piece of folded linen worn over the neck by nuns. (2) (From Fr. barbe, meaning “from Barbery”), a name applied to a breed of horses imported by the Moors into Spain from Barbary, and to a breed of pigeons.

BARBACENA, an inland town of Brazil, in the state of Minas Geraes, 150 m. N.N.W. of Rio de Janeiro and about 3500 ft. above sea-level. The surrounding district is chiefly agricultural, producing coffee, sugar-cane, Indian corn and cattle, and the town has considerable commercial importance. It is also noted for its healthfulness and possesses a large sanatorium much frequented by convalescents from Rio de Janeiro during the hot season. Barbacena was formerly a principal distributing centre for the mining districts of Minas Geraes, but this distinction was lost when the railways were extended beyond that point.

BARBADOS, or Barbadoes, an island in the British West Indies. It lies 78 m. E. of St Vincent, in 15° 4’ N. and 59° 37’ W.; is 21 m. long, 145 m. at its broadest, and 166 sq. m. (106,470 acres) in extent (roughly equalling the Isle of Wight). Its coasts are encircled with coral reefs, extending in some places 3 m. seaward. In its configuration the island is elevated but not mountainous. Near the centre is its apex, Mount Hillaby (1100 ft.), from which the land falls on all sides in a series of terraces to the sea. So gentle is the incline of the hills that in driving over the well-constructed roads the ascent is scarcely noticeable. The only natural harbour is Carlisle Bay on the south-western coast, which, however, is little better than a shallow roadstead, only accessible to light draught vessels.

Biology. — The oldest rocks of Barbados, known as the Scotland series, are of shallow water origin, consisting of coarse grits, brown sandstones and sandy clays, in places saturated with petroleum and traversed by veins of manjak. They have been folded and denuded, so as to form the foundation on which rest the later beds of the island. Upon the denuded edges of the Scotland beds lies the Oceanic series. It includes chalky limestones, siliceous earths, red clay, and, at the top, a layer of mudstone composed mainly of volcanic dust. The limestones contain Globigerina and other Foraminifera, the siliceous beds are made of Radiolaria, sponge spicules and diatomas, while the red clay closely resembles the red clay of the deepest parts of the oceans. There can be no doubt that the whole series was laid down in deep waters. The Oceanic series is generally overlaid directly, and unconformably, by coral limestones; but at Bissex Hill, at the base of the coral limestones, and resting unconformably upon the Oceanic series, there is a Globigerina marl. The Coral Limestone series lies immediately above the oldest beds. Although of no great thickness it covers six-sevenths of the island, rising in a series of steps or platforms to a height of nearly 1100 ft.

Even the Scotland series probably belongs to the Tertiary system, but owing to the want of characteristic fossils, it is impossible to determine with any degree of certainty the precise homotaxis of the several formations. Jukes-Browne and Harrison ascribe the Scotland beds to the Eocene or Oligocene period, the Oceanic series to the Miocene, the Bissex Hill marls to the Pliocene, and the coral limestones partly to the Pliocene and partly to the Pleistocene. But these correlations rest upon imperfect evidence.

Sandstone, and clays suitable for brick-making, are found in the district of Scotland, so called from a fancied resemblance to the Highlands of North Britain. The only other mineral product is manjak, a species of asphalt, also found in this district and to some extent exported.

Climate, &c. — The climate of Barbados is pleasant. The
seasons are divided into wet and dry, the latter (extending from December to the end of May) being also the cold season. The temperature ranges from 72° F. to 86° F. rarely, even on the coldest days, falling below 65° F. The average annual rainfall is about 60 in., September being the wettest month. For eight months the invigorating N.E. trade winds temper the tropical heat. The absence of swamps, the porous nature of the soil, and the extent of cultivation account for the freedom of the island from miasma. Fever is unknown. The climate has a beneficial effect on pulmonary diseases, especially in their earlier stages, and is remarkable in arresting the decay of vital power consequent upon old age. Leprosy occurs amongst the negroes, and elephantiasis is so frequent as to be known as “Barbados leg.”

Industries.—The cultivation of sugar was first introduced in the middle of the 17th century, and owing to the cheapness of labour, the extreme fertility of the soil and the care bestowed on its cultivation, became the staple product of the island. Cotton growing has recently become of importance. The few other industries include rum distilleries and factories for chemicals, ice and tobacco. A railway 28 m. long runs from Bridgetown partly round the coast. The island is a place of call for almost all the steamships plying to and from the West Indies, and is a great centre of mercantile traffic. There is direct communication at frequent intervals with England, the United States, Canada and the other West Indian islands.

Population and Administration.—The greater part of the inhabitants belong to the Church of England, which exceeds in numbers the combined total of all other denominations. The island is the see of a bishop, who, with the clergy of all creeds, is paid by the government. The chief educational establishment is Codrington College, founded by Colonel Christopher Codrington, who in 1710 bequeathed two estates to the Society for the Propagation of the Gospel. It trains young men for holy orders and is affiliated to the university of Durham. Harrison College and the Lodge are secondary schools for boys, Queen’s College for girls. There are several second grade and a large number of primary schools. The colony possesses representative institutions but not responsible government. The crown has a veto on legislation and the home government appoints the public officials, excepting the treasurer. The island is administered by a governor, assisted by an executive council, a legislative council of 9 members, and an executive council of 5 members elected on a limited franchise. Barbados is the headquarters of the Imperial Agricultural Department of the West Indies, to which (under Sir Daniel Morris) the island owes the development of cotton growing, &c. The majority of the population consists of negroes, passionately attached to the island, who have a well-marked physiognomy and dialect of their own, and are more intelligent than the other West Indian negroes. They outnumber the whites by 9 to 1. Barbados is one of the most densely populated areas in the world. In 1901 the numbers amounted to 105,588, or 1178 to the sq. m., and in 1906 they were 106,287. There are no crown lands nor forests.

Towns.—Bridgetown (pop. 21,000), the capital, situated on the S.W. coast, is a pretty town nestling at the foot of the hills leading to the uplands of the interior. It has a cathedral, St Michael’s, which also serves as a parish church. In Trafalgar Square stands the earliest monument erected to the memory of Nelson. There are a good many buildings, shops, pleasure grounds, a handsome military parade and exquisite beaches. Speightstown (1500) is the only other town of any size.

History.—Opinions differ as to the derivation of the name of the island. It may be the Spanish word for the hanging branches of a vine which strike root in the ground, or the name may have been given from a species of bearded fig-tree. In the 16th-century map the name is variously rendered St Bermando, Bernados, Barbudoso, Barnodos and Barnodo. There are more numerous traces of the Carib Indians here than in any other of the Antilles. Barbados is thought to have been first visited by the Portuguese. Its history has some special features, showing in how it does the process of peaceful colonization, for the island, acquired without contest, has never left out of the possession of the British. It was touched in 1605 by the British ship “Olive Blossom,” whose crew, finding it uninhabited, took possession in the name of James I.; but the first actual settlement was made in 1625, at the direction of Sir William Courtene under the patent of Lord Leigh, afterwards earl of Marlborough, to whom the island had been granted by the king. Two years later, a compromise having been effected with Lord Marlborough, a grant of the island was obtained by the earl of Carlisle, whose claim was based on a grant, from the king, of all the Caribbean islands in 1624; and in 1628 Charles Woll弗, a native of Bermuda, was appointed governor. In the same year sixty-four settlers arrived at Carlisle Bay and the present capital was founded. During the Civil War in England many Royalists sought refuge in Barbados, where, under Lord Willoughby (who had leased the island from the earl of Carlisle), they offered stout resistance to the forces of the Commonwealth. Willoughby, however, was ultimately defeated and exiled. After the Restoration, to appease the planters, doubtful as to the title under which they held the estates which they had converted into valuable property, the peace of the British and French, and the crown took over the government of the island; a duty of 4½% on all exports being imposed to satisfy the claims of the patentees. In 1684, under the governorship of Sir Richard Dutton, a census was taken, according to which the population then consisted of 26,000 whites and 46,000 slaves. The European wars of the 18th century caused much suffering, as the West Indies were the scene of numerous battles between the British and the French. During this period a portion of the 4½% duty was returned to the colony in the form of the governor’s salary. In the course of the American War of Independence Barbados again experienced great hardships owing to the restrictions placed upon the importation of provisions from the American colonies, and in 1778 the distress became so acute that the British government had to send relief. For three years after the peace of Amiens in 1802 the colony enjoyed uninterrupted calm, but in 1805 it was only saved from falling into the hands of the French by the timely arrival of Admiral Cochrane. Since that date, however, it has remained unthreatened in the possession of the British. The rupture between Great Britain and the United States in 1812 caused the island to feel the keenest suffering, with the result that the colony being thereby almost destroyed. This led to an agitation for the repeal of the 4½% duty, but it was not till 1838 that the efforts to secure this were successful. The abolition of slavery in 1834 was attended by no ill results, the slaves continuing to work for their masters as hired servants, and a period of great prosperity succeeded. The proposed confederation of the Windward Islands in 1876, however, provoked riots, which occasioned considerable loss of life and property, but secured for the people their existence as a separate colony. Hurricanes are the scourge of Barbados, those of 1780, 1831, and 1898 being so disastrous as to necessitate relief measures on the part of the home government.

BARBARA, ST. A virgin martyr and saint of the Roman Catholic and Orthodox Eastern Churches, whose festival day is December 4th. Her legend is that she was immured in a tower.
by her father who was opposed to her marriage; that she was converted to Christianity by a follower of Origen, and that when her father learnt this, he beheaded her. The place of her martyrdom is variously given as Heliopolis, as a town of Tarsus, and as Nicomedea, Bithynia, about the year 355. St Barbara is the patron saint of armourers and gunsmiths, and her protection is sought specially against lightning.

**BARBARIAN** (Gr. βαρβαρός), the name among the early Greeks for all foreigners. The word is probably onomatopoeic, designed to represent the uncouth babbling of which languages other than their own appeared to the Greeks to consist. Even the Romans were included in the term. The word soon assumed an evil meaning, becoming associated with the vices and savage natures of which they believed their enemies to be possessed. The Romans adopted the word for all peoples other than those under Graeco-Roman influence and domination. It has long become synonymous with a general lack of civilization.

**BARBARO, ERMOLAO** (HERMOLALUS BARBARS) (1454–1493), Italian scholar, was born at Venice on the 21st of May 1454. At an early age he was sent to Rome, where he studied under Pomponius Laetus. He completed his education at the university of Padua, where he was appointed professor of philosophy in 1477. Two years later he revisited Venice, but returned to Padua when the plague broke out in his native city. He was sent on various missions to persons of high rank, amongst them Pope Innocent VIII., by whom he was nominated to the important office of patriarch of Aquileia (1491). The Venetian senate, however, refused to ratify the appointment, which, contrary to the law, he had accepted without first obtaining its sanction. He was banished and forced to resign the patriarchate, under the threat of being punished vicariously by the confiscation of his father's property. Barbaro remained at Rome, in receipt of a small pension from the pontifical government, until his death (probably from the plague) on the 14th of June 1493 (according to some, two years later). He edited and translated a number of classical works, of which the most important were: *Castigations in the World of Nature* (published in 1544); *Castigations in Pompeion Melam* (1493).

**BARBAROSSA** ("Redbeard"), the name given by the Christians to a family of Turkish admirals and sea rovers of the 16th century,—Arouj and Khizr (alias Khair-ed-Din) and Hassan the son of Khair-ed-Din. As late as 1840, Captain Walsin Esterhazy, author of a history of the Turkish rule in Africa, ventured the guess that "Barbarossa" was simply a mispronunciation of Bâbâ Arouj, and the supposition has been widely accepted. But the prefix Babâ was not applied to Arouj by contemporaries. His name is given in Spanish or Italian form as "Orux" or "Harrach" or "Orliche." The contemporary Arabic chronicle published by S. Rang and F. Denis in 1837 says explicitly that Barbarossa was the name applied to Christians by Khair-ed-Din. It is no doubt a nickname given to the family on account of their red or tawny beards (Lat. barba). The founder of the family was Yakub, a Roumeliot, probably of Albanian blood, who settled in Mitylene after its conquest by the Turks. He was a coasting trader and skipper, and had four sons—Elias, Isaac, Arouj and Khizr, all said to have been born about 1482. Khizr became a poacher and Isaac a trader. Elias and Arouj took to sea roving. In an action with a galley of the Knights of Saint John, then established at Rhodes, Elias was killed and Arouj taken prisoner; the latter was ransomed by a Turkish pasha and returned to the sea. For some time he served the Mamelukes who still held Egypt. During the conflict between the Mamelukes and the sultan Selim I, he considered it more prudent to transfer himself to Tunis. The incessant conflicts among the Berber princes of northern Africa gave him employment as a mercenary, which he varied by piratical raids on the trade of the Christians. At Tunis he was joined by Khizr, who took, or was endowed with, the name of Khair-ed-Din. Isaac soon followed his brothers. Arouj and Khair-ed-Din joined the exiled Moors of Granada in raids on the Spanish coast. They also pushed their fortunes by fighting for, or murdering and supplanting, the native African princes. Their headquarters were in the island of Jerba in the Gulf of Gabes. They attempted in 1512 to take Bougie from the Spaniards, but were beaten off, and Arouj lost an arm, shattered by an arquebus shot. In 1514 they took Jijelli from the Genoese, and after a second beating at Bougie in 1515 were called in by the natives of Cherchel and Algiers to aid them against the Spaniards. They occupied the towns and murdered the native ruler who called them in. The Spaniards still held the little rocky island which gives Algiers its name and forms the harbour. In 1518 Arouj was drawn away to take part in a civil war in Tlemcen. He promptly murdered the prince he came to support and seized the town for himself. The rival party then called in the Spaniards, by whom Arouj was expelled and slain while fleeing at the Rio Salado. Khair-ed-Din clung to his possessions on the coast and appealed to the sultan Selim I. He was named beylerbey by the sultan, and with him began the establishment of Turkish rule in northern Africa. For years he was engaged in subduing the native princes, and in carrying on warfare with the Christians. In 1519 he repelled a Spanish attack on Algiers, but could not expel his enemies from the town till 1529. As a combatant in the forefront of the war with the Christians he became a great hero in Islam, and dreaded by its enemies under his name of Barbarossa. In 1534 he seized Tunis, acting as capitan pasha for the sultan Suleiman. The emperor Charles V. intervened on behalf of the native prince, retook the town, and destroyed great part of Barbarossa's fleet. The corsair retaliated by leading what remained of his navy on a plundering raid to the Balearic Islands. During the remainder of his life—till 1547—Barbarossa, though still beylerbey of northern Africa, was mainly engaged as capitan pasha in co-operating with the armies of the sultan Suleiman in the east. He was absent from Algiers when it was attacked by Charles V. in 1541. In 1543-1544 he commanded the fleet which Suleiman sent to the coast of Provence to support Francis I. Barbarossa would not allow the bells of the Christian churches to be rung while his fleet was in anchor in the port. He plundered the coast of Italy on his way back to Constantinople. When he died in his castle at Constantinople he was succeeded as beylerbey of Africa by his son Hassan. Hassan Barbarossa, like his father, spent most of his life in the Levant, but was occasionally in Africa when the influence of his family was required to suppress the disorders of the Turkish garrisons. He left it for the last time in 1567, and is said by Hammer-Purgstall to have been present at Lepanto in 1571. His last years are obscure.

**AUTHORITIES.—The History of the Ottoman Empire, by Joseph von Hammer-Purgstall (French translation J. J. Hellert, 1835–1843), contains accounts of the Barbarossas, but requires to be consulted by other authorities. See La Fondation de la régence d'Alger, histoire des Barbarosses, chronique arabe du XVIe siècle published by Sander Rang and Ferdinand Denis, Paris, 1837—for a history of the family from their story. H. D. de Grammont has collected later evidence in his Histoire d'Alger (Paris, 1887); and he discusses the origin of the name in a paper contributed to the Reuse Africaine, No. 171. Their campaigns are told in a readable and lively narrative by Adolphe de Courcy de Nonancourt in his Les corsaires barbaresques et la marine de Soliman le Grand (1887), and Doris et Barberousse (1886). The History of the History of the family of the Turks, by Haji Khallia (translated by J. Mitchell for the Oriental Society Fund, 1883), is said to have been founded on evidence collected by order of the sultan Suleiman.**

**BARBROUX, CHARLES JEAN MARIE** (1767–1794), French revolutionist, was educated at first by the Oratorians of Marseilles, then studied law, and became a successful advocate. He was appointed secretary (greffier) to the commune of Marseilles, and in 1792 was commissioned to go to the Legislative Assembly and demand the accusation of the director of the department of Bouches-du-Rhône, as accomplice in a royalist movement in Aries. At Paris he was received in the Jacobin club and entered into relations with J. P. Brissot and the Rolandas. It was at this instigation that Marseilles sent to Paris the battalion of volunteers which contributed to the inscription of the 10th of August 1792 against the king. Returning to Marseilles he helped to repress a royalist movement at Avignon and an ultra-Jacobin movement.
at Marseilles, and was elected deputy to the Convention by 775 votes out of 775 voting. From the first he posed as an opponent of the Mountain, accused Robespierre of aiming at the dictatorship (25th of September 1793), attacked Marat, and proposed to break up the commune of Paris. Then he got the act of accusation against Louis XVI. adopted, and in the trial voted for his death "without appeal and without delay." During the final struggle between the Girondists and the Mountain, he refused to resign as deputy and rejected the offer made by the sections of Paris to give hostages for the arrested representatives. He succeeded in escaping, first to Caen, where he organized the civil war, then to Saint-Émilion near Bordeaux, where he wrote his Mémoires, which were published in 1822 by his son, and re-edited in 1866. Discovered, he attempted to shoot himself, but was only wounded, and was taken to Bordeaux, where he was gillotined when his identity was established.

BARBARY, the general designation of that part of northern Africa bounded by Egypt, W. by the Atlantic, S. by the Sahara and N. by the Mediterranean, comprising the states of Morocco, Algeria, Tunisia, and Tripoli. The name is derived from the Berbers, the chief inhabitants of the region.

BARBARY APE, a tailless monkey inhabiting Algeria, Morocco, and the rock of Gibraltar (where it may have been introduced), and referable to the otherwise Asiatic group of macaques, in which it alone represents the subgenus Inus. This monkey, Macacus inus, is light yellowish-brown above and yellowish-white below, with the naked part of the face flesh-coloured. It is entirely terrestrial in habits, at least on Gibraltar, and goes about in droves.

BARBARY PIRATES. The coast population of northern Africa has in past ages been addicted to piratical attacks on the shores of Europe opposite. Throughout the decline of the Roman empire, the barbarian invasions, the Mahommedan conquest and the middle ages, mere piracy always existed by the side of the great strife of peoples and religions. In the course of the 14th century, when the native Berber dynasties were in decadence, piracy became particularly flagrant. The town of Bougie was then the most notorious haunt of these "skimmers of the sea." But the savage robber powers which, to the disgrace of Europe, infested the commerce and the coasts, not only of the Mediterranean but even for a time of the ocean; who were not finally suppressed till the 19th century was well advanced; and who are properly known as the Barbary pirates, arose in the 16th century, attained their greatest height in the 17th, declined gradually throughout the 18th and were extinguished about 1830. Isolated cases of piracy have occurred on the Rif coast of Morocco even in our time, but the pirate communities which lived by plunder and could live by no other resource, vanished with the French conquest of Algiers in 1830. They are intimately connected with the general history of northern Africa from about 1492 to their end. The story of the establishment of Turkish rule in northern Africa and of the revolutions of Morocco must be sought under the heads of Turkey, Tripoli, Tunisia, Algeria and Morocco.

In dealing with the pirates, it will be sufficient to note a few leading dates. The conquest of Granada in 1492 by the Catholic sovereigns of Spain drove many Moors into exile. They revenged themselves by piratical attacks on the Spanish coast. They had the help of Moslem adventurers from the Levant, of whom the most successful were Arouj and his brother Khair-ed-Din, natives of Mitylene, both of whom were known to the Christians by the nickname of Barbarossa (q.v.) or "Redbeard." Spain in self-defence began to conquer the coast towns of Oran, Algiers and Tunis. Arouj having fallen in battle with the Spaniards in 1518, his brother Khair-ed-Din appealed to Selim, the sultan of Turkey, who sent him troops. He drove the Spaniards in 1529 from the rocky island in front of Algiers, where they had a fort, and was the founder of the Turkish power. From about 1528 till the death of Uluch Ali in 1587, Algiers was the main seat of government of the beylerbey of northern Africa, who ruled over Tripoli, Tunisia and Algeria. From 1587 to 1659, they were ruled by Turkish pashas, sent from Constantinople to return for three years; but in the latter year a military revolt in Algiers reduced the pasha to nonentities. From 1659 onwards, these African cities, though nominally forming parts of the Turkish empire, were in fact anarchical military republics which chose their own rulers and lived by plunder.

It may be pointed out that during the first period (1518-1587) the beylerbey were admirals of the sultan, commanding great fleets and conducting serious operations of war for political ends. They were slave-hunters and their methods were ferocious, but their Christian enemies were neither more humane nor more chivalrous. After 1587, plunder became the sole object of their successors—plunder of the native tribes on land and of all who went upon the sea. The maritime side of this long-lived brigandage was conducted by the captains, or reises, who formed a class or even a corporation. Cruisers were fitted out by capitalists and commanded by the reises. Ten per cent of the value of the prizes was paid to the treasury of the pasha or his successors, who bore the names of Agba or Dey or Bey. Bougie was the chief shipbuilding port and the timber was mainly drawn from the country behind it. Until the 17th century the pirates used galleys, but a Flemish renegade of the name of Simon Danser taught them the advantage of using sailing ships. In this century, indeed, the main strength of the pirates was supplied by renegades from all parts of Christendom. An English gentleman of the distinguished Buckinghamshire family of Verney was for a time among them at Algiers. This port was so much the most formidable that the name of Algerine came to be used as synonymous with Barbary pirate, but the same trade was carried on, though with less energy, from Tripoli and Tunis—as also from towns in the empire of Morocco, of which the most notorious was Salli. The introduction of sailing ships gave increased scope to the activity of the pirates. While the galleys, being unfit for the high seas, were confined to the Mediterranean and the coast, the sailing vessels ranged into the Atlantic as far as the Canaries or even to Iceland. In 1631 a Flemish renegade, known as Murad Reis, sacked Baltimore in Ireland, and carried away a number of captives who were seen in the slave-market of Algiers by the French historian Pierre Dan.

The first half of the 17th century may be described as the flowering time of the Barbary pirates. More than 20,000 captives were said to be imprisoned in Algiers alone. The rich were allowed to redeem themselves, but the poor were condemned to slavery. Their masters would not in many cases allow them to secure freedom by professing Mahommedanism. A long list might be given of people of good social position, not only Italians or Spaniards, but German or English travellers in the south, who were captives for a time. The chief sufferers were the inhabitants of the coasts of Sicily, Naples and Spain. But all traders belonging to nations which did not pay blackmail in order to secure immunity were liable to be taken at sea. The payment of blackmail, disguised as presents or ransoms, did not always secure safety with these faithless barbarians. The newly powerful states in Europe condescended to make payments to them in order to tolerate their insults. Religious orders—the Redemptions and Lazarites—were engaged in working for the redemption of captives and large legacies were left for that purpose in many countries. The continued existence of this African piracy was indeed a disgrace to Europe, for it was due to the jealousies of the powers themselves. France encouraged them during her rivalry with Spain; and when she had no further need of them they were supported against her by Great Britain and Holland. In the 18th century British public men were not ashamed to say that Barbary piracy was a useful check on the competition of the weaker Mediterranean nations in the carrying trade. When Lord Exmouth sailed to coerce Algiers in 1816, he expressed doubts in a private letter whether the suppression of piracy would be acceptable to the trading community. Every power was, indeed, desirous to secure immunity for itself and more or less ready to compel Tripoli, Tunis, Algiers, Salli and

384

the rest to respect its trade and its subjects. In 1655 the British admiral, Robert Blake, was sent to teach them a lesson, and he gave the Tunisians a severe beating. A long series of expeditions was undertaken by the British fleet during the reign of Charles II., sometimes single-handed, sometimes in combination with the Dutch. In 1682 and 1683 the French bombarded Algiers. On the second occasion the Algerines blew the French consul from a gun during the action. An extensive list of such punitive expeditions could be made out, down to the American operations of 1801-5 and 1815. But in no case was the attack pushed home, and it rarely happened that the aggrieved Christian state refused in the end to make a money payment in order to secure peace. The frequent wars among them gave the pirates numerous opportunities of breaking their engagements, of which they never failed to take advantage.

After the general pacification of 1815, the suppression of African piracy was universally felt to be a necessity. The insouciance of a Tunisian squadron which sacked Palma in the island of Sardinia and carried off 108 of its inhabitants, roused widespread indignation. Other influences were at work to bring about their extinction. Great Britain had acquired Malta and the Ionian Islands and had now many Mediterranean subjects. She was also engaged in pressing the other European powers to join with her in the suppression of the Barbary States. Piracy was denounced on a large scale and at the expense of Europe. The suppression of the trade was one of the objects of the congress of Vienna. Great Britain was called on to act for Europe, and in 1816 Lord Exmouth was sent to obtain treaties from Tunis and Algiers. His first visit produced diplomatic documents and promises and he sailed for England. While he was negotiating, a number of British subjects had been brutally ill-treated at Bona, without his knowledge. The British government sent him back to secure reparation, and on the 27th of August, in combination with a Dutch squadron under Admiral Van Capellen, he administered a smashing bombardment to Algiers. The lesson terrified the pirates both of that city and of Tunis into giving up over 3000 prisoners and making fresh promises. But they were not reformed and were not capable of reformation. Algiers renewed its piracy and slave-taking, though on a smaller scale, and the measures to be taken with it were discussed at the conference or congress of Aix-la-Chapelle in 1818. In 1824 another British fleet under Admiral Sir Harry Neill had again to bombard Algiers. The great pirate city was now in fact a subject of the French crown.

AUTHORITIES.—The Histoire d' Alger of H. D. de Grammont (Paris, 1887) is based on original authorities. Sir R. L. Playfair's Scourge of Christendom (London, 1884) gives the history of the British con- sulate in Algiers. The main authorities for the early history of the Barbary States are:—Luis del Marmol Carvajal, Descripcion de Africa (Granada, 1573); Diego de Haedo, Topografia y Historia General de Argen (Valladolid, 1612); and Père Pierre Dan, Histoire de Barbarie et de ses corsaires (Paris, 1627). The readable treatises of Ad. Jurien de la Gravière, all published in Paris, Domus et Barbarous (1866); Les Corsaires barbaresques (1867). Les Chauviers de Malte (1887) and La Guerre de Chypre (1888), deal with the epoch of the beylerbeyis and the regular wars. For American work see Gardner Weld Allen, Our Navy and the Barbary Corsairs (New York, 1905). (D. H.)

BARBAULD, ANNA LETITIA (1743-1825), English poet and miscellaneous writer, was born at Kidwelly-Harcourt, in Leicestershire, on the 20th of June 1743. Her father, the Rev. John Aikin, a Presbyterian minister and schoolmaster, taught his daughter Latin and Greek. In 1768 Mr Aikin removed his family to Warrington, to act as theological tutor in a dissenting academy there. In 1773 Miss Aikin published a volume of Poems, which was the beginning of her success, and she continued to cooperate with her brother, Dr John Aikin, in a volume of Miscellaneous Pieces in Prose. In 1774 she married Rochomont: Barbauld, a member of a French Protestant family settled in England. He had been educated in the academy at Warrington, and was minister of a Presbyterian church at Palgrave, in Suffolk, where, with his wife's help, he established a boarding school. His admirable Hymns in Prose and Early Lessons were written for their pupils. In 1783 she left England for the continent with her husband, whose health was seriously impaired. On their return two years later, Mr Barbauld was appointed to a church at Hampstead. In 1802 they removed to Stoke Newington. Mrs Barbauld became well known in London literary circles. She collaborated with Dr Aikin in his Evenings at Home; in 1785 she published a translation of Akenside's Pleasures of Imagination, with a critical essay; two years later she edited Colline's Odes; in 1804 she published a selection of papers from the English Essayists, and a selection from Samuel Richardson's correspondence, with a biographical notice; in 1810 a collection of the British Novelists (50 vols.) with biographical and critical notices; and in 1811 her longest poem, Eighteen Hundred and Eleven, giving a gloomy view of the existing state and future prospects of Britain. This poem anticipated Macaulay in contemplating the prospect of a visitor from the antipodes regarding at a future day the ruins of St Paul's, from a broken arch of Blackfriars Bridge. Mrs Barbauld died on the 9th of March 1825; her husband had died in 1808. A collected edition of her works, with memoir, was published by her niece, Lucy Aikin, in 2 vols., 1825.

See A. L. le Breton, Memoir of Mrs Barbauld (1874); G. A. Ellis, Life and Letters of Mrs A. L. Barbauld (1874); and Lady Thackeray Ritchie, A Book of Obit (1883).

BARBECUE (Span. barbacoa), originally a framework on posts placed over a fire on which to dry or smoke meat; hence a gridiron for roasting whole animals, and in Cuba an upper floor on which fruit or grain is stored. In the United States the word means an open-air feast, either political or social, where whole animals are roasted and eaten and hogsheads of beer and other vast quantities of food and drink consumed.

BARBED WIRE, a protective variety of fencing, consisting usually of several strands of wire twisted together with sharp spikes or points clinched or fastened into the strands.

In the United States, barbed wire for fencing was originally suggested to meet conditions existing in the western states, by reason of the large cattle-raising industry in sections where timber was scarce. Prior to its introduction, a No. 9 round or oval iron wire was popular on the frontier of the United States and in South America, as a fencing material. Large amounts were used annually for this purpose, but iron lacked strength, and single wire strand was not fully satisfactory on account of stretching in warm and contracting in cold weather, and thus being broken. Cattle would rub against a smooth fence, and this constant pressure loosened the posts and broke the wire. To overcome this defect, barbed wire—produced by E. F. Glidden—was introduced as a substitute for plain iron wire. It was found that a single strand of this wire could be used and at the same time be free from destruction by the animals it was intended to confine. This investigation resulted in the invention of barbed wire. Soon after, automatic machinery was invented for rapidly and cheaply placing the barb upon the smooth wire, so that the cost of barbed wire is much less than the cost of smooth wire when it is in general use. So immediately did barbed wire find favour with the farmers of the United States, and, in fact, all over the world, that the manufacture of wire was revolutionized.

The history of barbed wire fencing is of recent date. In the United States—the real home of this industry—patents were taken out by Lucien B. Smith, Kent, Ohio, in 1867; by William B. Hunt, of Scott, N.Y., at almost the same time; and by Michael Kelly, of New York, a year later. The practical beginning of the industry, however, was in the patents issued to Joseph F. Glidden, DeKalb, Ill., 1874, on barbed fence wire, and during the same year, to Joseph F. Glidden and Phineas F. Vaughan, for a machine to manufacture the same. These inventions were the beginning of the thousands of patents under which barbed wire has been protected and sold. The development of the barbed wire industry would hardly have been possible without steel. Iron wire, used for fencing prior to the introduction of steel, was not suitable, seeing that iron does not possess sufficient tensile strength and lacks homogeneity, qualities which Bessemer and open-hearth steels possess in a high degree. The advantages of galvanized barbed wire fencing are that it is almost imperishable, is not burden on the posts; does not
oppose the wind with enough surface to rack the posts, thus allowing water to settle around them and rot them; is economical, not only in the comparative cheapness of its first cost but also in the amount of land covered by it; and is effective as a barrier against all kinds of stock and a protection against dogs and wild beasts. Cattle, once discovering what it is, will not press against it, nor even go near it, and thus it becomes an effective means of dividing the farmer's ranch into such fields as he may desire. It is quickly and cheaply constructed, and has the advantage of freedom from harbouring weeds. It affords no impediment to the view. A man can see across his farm, and ascertain what is going on in every portion within the scope of vision, as plainly as if there were no fences. It does not contribute to the formation of snow drifts as do other kinds of efficient fence. This makes it a favourite form of fencing for railroads and along highways.

Finally, barbed wire composed of two wires twisted together, once firmly put in place, will retain its taut condition through many seasons without repair. The fact of the wire being twisted allows it to adapt itself to all the varying temperatures.

The introduction of barbed wire met with some opposition in America on supposed humanitarian grounds, but ample and extended tests, both of the economy and the humanity of the new material, silenced this objection. Now no American farmer, especially in the west, ever thinks of putting any other kind of fencing on his farm, unless it may be the new types of meshed wire field fencing which have been coming so generally into use since 1899. Generally speaking, the use of barbed wire fencing in other countries has not been as extensive as in the western United States. While it has been used on a comparatively large scale in Argentina and Australia, both of these countries use a much larger quantity of plain wire fence, and in Argentina, the important consumption of high-carbon oval fence wire of great strength, which apparently forms the only kind of fence that meets the conditions in a satisfactory manner.

It is interesting to note the largely increased demand for meshed wire field fencing in the more thickly settled-portions of the United States, and along the lines of railroads. Beginning with 1899, there has been an annual increase in this demand, owing to the scarcity and rapid rise in the cost of labor and to the diminishing of the building of rail fences. Meshed wire is considered by many a better enclosure for small animals, like sheep and hogs, than the barbed wire fence. Barbed wire has been used in the past for barbed wire车站, and the disadvantages of the fencing have been substituted with advantage, the fencing being made of wires of larger diameter than formerly, to insure greater stability. The popularity of barbed wire is best shown by the following statistics:

Barbed wire is usually shipped to customers on wooden spools, each holding approximately 100 rods. A standard size is provided through the centre of the spool for inserting a bar, on which the reel can revolve for unwinding the wire as it is put up. After the wire is stretched in place, it is attached to the wooden posts by means of steel wires made of No. 9 wire. They are cut with a sharp, long, diagonal point and can be easily driven into the posts. On account of the rapid decay and destruction of wooden posts, steel posts have become popular, as they have reinforced concrete posts, which add materially to the durability of the fence. It is important that barbed wire be stretched with great care. For this purpose a suitable barbed wire stretcher is necessary.

Barbed wire fencing is now manufactured in various patterns. The general process may be outlined briefly as follows:—The wire is made of soft Bessemer or Siemens-Martin steel, and is drawn in the wire mill in the usual way. Galvanizing is done by a continuous process. The coating of the wire to be galvanized is placed on a reel. The first end of the wire is led longitudinally through a medium—either red-hot lead or heated fire-brick tubes—of sufficient length to soften the wire. From the annealing furnace, the wire is fed into the galvanizing machine, and is passed through a series of the scaling, and from the acid, after a thorough washing in water, the wire passes through a bath of splatter, heated slightly above the melting point. After coming from the splatter and being cooled by water, the wire is passed into the spray tanks, where it is thoroughly cleaned and washed. From 30 to 60 wires are passing simultaneously in parallel lines through this continuous galvanizing apparatus, thus insuring a large output. The galvanizing gives the wire a bright finish and serves to protect it from the rusting of barbed wire, and it is at the same time a considerable demand for painted fencing, in the manufacture of which the galvanizing is dispensed with, and the spoils of finished barbed wire, as they come from the galvanizing machine, are submerged in paint and dried. The barbing and twisting to-}

---

**BARBEL—BARBÉ-MARBOIS**

Barbel (Barbus vulgaris), a fish of the Cyprinid family, which is an inhabitant of the rivers of central Europe, and very locally distributed in England. It has four barbs (Lat. barba, beard; fleshy appendages hanging from the mouth), and the first ray of the short dorsal fin is strong, spine-like and serrated behind. It attains a weight of 50 lb on the continent of Europe. The genus of which it is the type is a very large one, comprises about 100 species, and is widely distributed, but the great sporting fish of India.

**BARBÉ-MARBOIS, FRANÇOIS, MARQUIS DE (1745-1837),** French politician, was born at Metz. He began his public career as intendant of San Domingo under the old régime. At the close of 1789 he returned to France, and then placed his services at the disposal of the revolutionary government. In 1791 he was sent to Regensburg to help to Noailles, the French ambassador, in the negotiations with the diet of the Empire concerning the
possessions of German princes in Alsace and Lorraine. Suspected of treason, he was arrested on his return but set at liberty again. In 1793 he was a member of the Council of the Ancients, where the general emancipation of his attitude was clearly seen in the exclusion of nobles and the relations of émigrés from public life, brought him under suspicion of being a royalist, though he pronounced a eulogy on Bonaparte for his success in Italy. At the coup d'état of the 18th Fructidor (September 4) 1797, he was arrested and transported to French Guiana. Transferred to Oléron in 1799, he owed his liberty to Napoleon, after the 18th Brumaire. In 1801 he became councillor of state and director of the public treasury, and in 1802 a senator. In 1803 he negotiated the treaty by which Louisiana was ceded to the United States, and was rewarded by the First Consul with a gift of 152,000 francs. In 1805 he was made grand officer of the Legion of Honour and a count, and in 1808 he became president of the Cour des Comptes. In return for these favours, he addressed Napoleon with servile compliments; yet in 1814 he helped to draw up the act of abdication of the emperor, and declared to the Cour des Comptes, with reference to the invasion of France by the allies, united for the time, beautiful of causes, it is long since we have been so free as we now are in the presence of the foreigner in arms.” In June 1814, Louis XVIII. named him peer of France and confirmed him in his office as president of the Cour des Comptes. Deprived of his positions by Napoleon during the Hundred Days he was appointed minister of justice in the ministry of the duc de Richelieu (August 1815). In this office he tried unsuccessfully to gain the confidence of the ultra-royalists, and withdrew at the end of nine months (May 10, 1816).

In 1830, when Louis Philippe assumed the reins of government, Barbé-Marbois went, as president of the Cour des Comptes, to compliment him and was confirmed in his position. It was the sixth government he had served and all with servility. He held his office until April 1834, and died on the 12th of February 1837. He published various works, of which may be mentioned: Réflexions sur la colonie de Saint-Domingue (1794), De la GUYANE, &c. (1822), an Histoire de la Louisiana et de la cession de cette colonie par la France aux États-Unis, &c. (1828), and the story of his transportation after the 18th Fructidor in Journal d'un déporté non jugé, 2 vols. (1834).

BARBER (from Lat. barba, beard), one whose occupation it is to shave or trim beards, a hairdresser. In former times the barber's craft was dignified with the title of a profession, being conjoined with the art of surgery. In France the barber-surgeons were separated from the perruquiers, and incorporated as a distinct body in the reign of Louis XIV. In England barbers first received incorporation from Edward IV. in 1461. By 32 Henry VIII. c. 42, they were united with the company of surgeons, it being enacted that the barbers should confine themselves to the minor operations of blood-letting and drawing teeth, while the surgeons were prohibited from "barbey or shaving." In 1745 barbers and surgeons were separated into distinct corporations by 12 George II. c. 15. The barber's shop was a favorite resort of idle persons; and in addition to its attraction as a focus of news, a lute, viol, or some such musical instrument, was always kept for the entertainment of waiting customers. The barber's sign consisted of a striped pole, from which was suspended a basin, symbols of the use of which is still preserved. The fillet round the pole indicated the ribbon for bandaging the arm in bleeding, and the basin the vessel to receive the blood.

See also Beard, and Annals of the Barber Surgeons of London (1890).

BARBERINI, the name of a powerful Italian family, originally of Tuscan extraction, who settled in Florence during the early part of the 11th century. They acquired great wealth and influence, and in 1623 Maffeo Barberini was raised to the papal throne as Urban VIII. He made his brother, Antonio, a distingushed statesman, and two nephews, cardinals, and gave to a third nephew, Taddeo, the principality of Palestrina. Great jealousy of their increasing power was excited amongst the neighbouring princes, and Odoardo Farnese, duke of Parma, made war upon Taddeo, and defeated the papal troops. After the death of Urban in 1644 his successor, Innocent X., showed hostility to the Barberini family. Taddeo fled to Paris, where his family the Barberini became extinct in the male line. His daughter Cornelia married Cesare Colonna di Sciarra in 1728, who added her name to his own. On the death of Prince Enrico Barberini-Colonna the name went to his daughter and heiress Donna Maria and her husband Marquis Luigi Sacchetti, who received the title of prince of Palestrina and permission to bear the name of Barberini. The fine Barberini palace and library in Rome give evidence of their wealth and magnificence. The ruthless way in which they plundered ancient buildings to adorn their own palaces is the origin of the saying, “Quod non fecerunt barbari, fecerunt Barberini.”

BARBERRY (Berberis vulgaris), a shrub with spiny-toothed leaves, which on the woody shoots are reduced to forked spines, and pale yellow flowers in hanging racemes, which are succeeded by chorozes that become berries; they are found in the Himalayas, South Asia, Patagonia, and the Andes of South America. The genus Berberis includes about 200 species in the temperate and south temperate zones in the Andes of South America. The order Berberidaceae, and contains about 200 species in the south temperate zone and in the Andes of South America extending into Patagonia. The order is nearly allied to the buttercup order in having the parts of the flowers all free and arranged in regular succession below the ovary which consists of only one carpel. It is distinguished by having the sepals, petals and stamens in multiples of 2, 3 or 4, never of 5. The berries of Berberis are edible; those of the native barberry are sometimes made into preserves. The alkaloid berberine (b.z.) occurs in the roots.

BARBERTON, a town of the Transvaal, 283 m. by rail (175 m. in a direct line) E. of Pretoria and 136 m. W.N.W. of Delagoa Bay. Pop. (1904) 2433, of whom 1214 were whites. Barberon lies 2825 ft. above the sea and is built on the side of a valley named De Kaap, from a bold headland of the Drakensberg which towers above it. The chief town of a district of the same name, it owes its existence to the discovery of gold in the Kaap valley, and dates from 1886. There are several fine public buildings grouped mainly round President Square. The town is connected with the Lourenço Marques-Pretoria trunk railway by a branch line, 35 m. long, which runs N.E. through fine mountainous country and joins the main line at Kaapmusdien. During the war of 1899-1902 the Boers were driven out of Barberton (13th of September 1900) by General (afterwards Sir John) French.

BARBETTE (Fr. diminutive of barbe, a beard), a platform inside a fortification raised sufficiently high for artillery placed thereon to be able to fire en barbette, viz. over the top of the parapet; also in warships a raised platform, protected by armour on the sides, upon which guns are mounted en barbette.

BARBEY D'AUREVILLY, JULES AMBÉDE (1868-1888), French man of letters, was born at Saint-Sauveur-le-Vicomte (Maine) on the 2nd of November 1868. His most famous novels are Une Vieille Matresse (1851), attacked at the time of its publication on the charge of immorality; L'Ensoortée (1854), an episode of the royalist rising among the Norman peasants against the first republic; the Chevalier Destouches (1864); and a collection of extraordinary stories entitled Les Diaboliques (1874). Barbey d'Aurevilly is an extreme example of the eccentricities of which the Romanticists were capable, and to read him is to understand the discredit that fell upon the manner. He held extreme Catholic views and wrote on the most risqué subjects; he gave himself aristocratic airs and hinted at a mysterious past, though his parentage was entirely bourgeois and his youth very hum-drum and innocent. In the 'fifties d'Aurevilly became literary critic of the Paris, and a number of his essays, contributed to this and other journals, were collected as Les Écrivains et les hommes du XIXe siècle (1861-1865). Other literary studies are Les Romanciers (1866) and Goethe et Balzac (1888). He died in Paris on the 23rd of April 1889. Paul Bourget describes him as a dreamer with an exquisite sense of vision, who sought and found in his work a refuge from the
uncongenial world of every day. Jules Lemaître, a less sympathetic critic, finds in the extraordinary crimes of his heroes and heroines, their reactionary views, his dandyism and snobbery, and his anglicised Byronism.

See also Alcide Du associated, Jules Barby d'Aureville (1862), a collection of essays and editorials; Paul Bourget, Preface to d'Aureville's Memoria (1883); Jules Lemaître, Les Contemporains; Eugène Grell, Barby d'Aureville, sa vie et son œuvre (1902); René Dommée, in the Recueil des deux mondes (Sept. 1902).

BAREYRAC, JEN (1674-1744), French jurist, the nephew of Charles Bareyra, a distinguished physician of Montpellier, was born at Beziers in Lower Languedoc on the 15th of March 1674. He removed with his family into Switzerland after the revocation of the edict of Nantes, and there studied jurisprudence. After spending some time at Geneva and Frankfort-on-Main, he became professor of belles-lettres in the French school of Berlin. Thence, in 1711, he was called to the professorship of history and civil law at Lausanne, and finally settled as professor of public law at Groningen. He died on the 3rd of March 1744. His fame rests chiefly on the preface and notes to his translation of Pufendorf's treatise De Jure Naturae et Gentium. In fundamental principles he follows almost entirely Locke and Pufendorf; but he works out with great skill the theory of moral obligation, referring it to the command or will of God. He indicates the distinction, developed more fully by Thomasius and Kant, between the legal and the moral qualities of action. The principles of international law he reduces to those of the law of nature, and combats, in so doing, many of the positions taken up by Grotius. He rejects the notion that sovereignty in any way resembles property, and makes even marriage a matter of civil contract. Bareyra also translated Grotius's De Jure Belli et Pacis, Cumberland's De Legibus Naturae, and Pufendorf's smaller treatise De Officio Hominis et Civis. Among his own productions are a treatise, De la morale des pêres, a history of ancient treaties contained in the Supplement au grand corps diplomatique, and the curious Traité du jeu (1709), in which he defends the morality of games of chance.

BAREYRAC—BARBITON

BARBIER, ANTOINE ALEXANDRE (1765-1823), French librarian and bibliographer, was born on the 11th of January 1765 at Coulommiers (Seine-et-Marne). He took priest's orders, from which, however, he was finally released by the pope in 1801. In 1794 he became a member of the temporary commission of the arts, and was charged with the duty of distributing among the various libraries of Paris the books that had been confiscated during the revolution. In the execution of this task he discovered the letters of Huet, bishop of Avranches, and the MSS. of the works of Fénelon. He became librarian successively to the Secret, to the Conseil d'État, and in 1807 to Napoleon, from whom he carried out a number of commissions. He produced a standard work in his Dictionnaire des ouvrages anony mes et pseudonymes (4 vols., 1806-1809; 3rd edition 1872-1879). Only the first part of his Examen critique des dictionnaires historiques (1820) was published. He had a share in the foundation of the libraries of the Louvre, of Fontainebleau, of Compiègne and Saint-Cloud; under Louis XVIII. he became administrator of the king's private libraries, but in 1822 he was deprived of all his offices. Barbier died in Paris on the 5th of December 1825.

See also a notice by his son, Louis Barbier, and a list of his works published in the 3rd edition of the Dict. des ouvrages anony mes et pseudonymes.

BARBIER, HENRI AUGUSTE (1805-1882), French dramatist and poet, was born in Paris on the 20th of April 1805. Inspired by the revolution of July he poured forth a series of eager, vigorous poems, denouncing, crudely enough, the evils of the time. They are spoken of collectively as the Iambes (1831), though the designation is not strictly applicable to all. As the name suggests, they are modelled on the verse of André Chénier. They include La Curte, La Popularité, L'Ilole, Paris, Donz, Quatre-vingt-treize and Varsovie. The rest of Barbier's poems are forgotten, and when, in 1859, he received the long delayed honour of admission to the Academy, Montalembert expressed the general sentiment in his Barbier? mais il est mort! It was even asserted, though without foundation, that he was not the real author of the Tombe. He died at Nice on the 13th of February 1882. He collaborated with Léon de Wailly in the libretto of Berlioz's opera, Benvenuto Cellini, and his works include two series of poems on the political and social troubles of Italy and England, printed in later editions of Les Iambes et poèmes.

See also Sainte-Beuve, Portraits contemporains, vol. ii.

BARBIER, LOUIS, known as the Abbé de la Rivière (1595-1670), French bishop, was born of humble parents in Vaudelaincourt, near Compiègne. He entered the church and made his way by his wit and cleverness, until he was appointed tutor, and then became the friend and adviser, of Gaston d'Orléans, brother of Louis XIII. He thus gained an entrance to the court, became grand almoner of the queen, and received the revenue of rich abbey. In March 1655 he was named bishop of Langres, but he spent his time at court, where his wit was always in demand, and where he gained great sums by gambling. He died very rich.

BARBIERI, GIOVANNI FRANCESCO (otherwise called Guercino, from his squinting), (1591-1666), Italian historical painter, was born at Cenio, a village not far from Bologna. His artistic powers were developed very rapidly, and at the age of seventeen he was associated with Benedetto Gennari (1550-1610), a well-known painter of the Bolognese school. The fame of the young painter spread beyond his native village, and in 1615 he removed to Bologna, where his paintings were much admired. His first style was formed after that of the Carracci; but the strong colouring and shadows employed by Caravaggio made a deep impression on his mind, and for a considerable period his productions showed evident traces of that painter's influence. Some of his latest pieces approach rather to the manner of his great contemporary Guido, and are painted with more lightness and clearness. Guercino was esteemed very highly in his lifetime, not only by the nobles and princes of Italy, but by his brother artists, who placed him in the first rank of painters. He was remarkable for the extreme rapidity of his execution; he painted a few of his best productions in a single day, and his other paintings amount to about 144. His most famous piece is thought to be the St Petronilla, which was painted at Rome for Gregory XV, and is now in the Capitol. In 1626 he began his frescoes in the Duomo at Piacenza. Guercino continued to paint and teach up to the time of his death in 1666. He had amassed a handsome fortune by his labours. His life, by J. A. Calvi, appeared at Bologna in 1808.

His brother, Paolo Antonio Barbieri (1603-1649), was a celebrated painter of still life and animals. He chose for his subjects fruits, flowers, insects and animals, which he painted after nature with a lively tint of colour, great tenderness of pencil, and a strong character of truth and life.

BARBITON, or BARBITUS (Gr. βαρβίτος or βαρβάτος; Lat. barbitus; Pers. barbat, barbud), an ancient stringed instrument known to us from the Greek and Roman classics, but derived from Persia. Theocritus (xvi. 45), the Sicilian poet, calls it an instrument of many strings, i.e. more than seven, which was by the Hellenes accounted the perfect number, as in the cithara of the best period. Andron (a native of Teos in Asia Minor) sings that his barbitos only gives out erotic tones. Pollux (Onomasticon iv. chap. 8, § 59) calls the instrument barbiton or barymite (from βαρβός, heavy and μυρός, a string), an instrument producing deep sounds; the strings were twice as long as those of the plectos and sounded an octave lower. Findan (in Athen. xiv. p. 635), in the same line wherein he attributes the introduction of the instrument into Greece to Terpander, tells us one could use for the lyre itself, i.e. play in two parts at an interval of an octave on the two instruments. The word barbiton was frequently used for the lyre itself. Although in use in Asia Minor, Italy, 

BARBIZON

Sicily, and Greece, it is evident that the barbiton never won for itself a place in the affections of the Greeks of Hellas; it was regarded as a barbarian instrument affected by those only whose tastes in matters of art were unorthodox. It had fallen into disuse in the days of Aristotle, but reappeared under the Romans.

In spite of the few meagre shreds of authentic information extant concerning this somewhat elusive instrument, it is possible nevertheless to identify the barbiton as it was known among the Greeks and Romans. From the Greek writers we know that it was an instrument having some feature or features in common with the lyre, which warranted classification with it. From the Persians and Arabs we learn that it was a kind of rebab or lute, or a chelys-lyre, first introduced into Europe through Asia Minor by way of Greece, and centuries later into Spain by the Moors, amongst whom it was in the 14th century known as al-barbet. There is a stringed instrument, as yet unidentified by name, of which there are at least four different representations in sculpture, which combines the characteristics of both lyre and rebab, having the vaulted back and gradual narrowing to form a neck which are typical of the rebab and the stringing of the lyre, and resembles a large lute with a wide neck, and the seven strings of the lyre of the best period, or sometimes nine, following the decadic list. Most authors in reproducing these sculptures showing the barbiton represent the instrument as boat-shaped and without a neck, as, for instance, Carl Engel. This is due to the fact that the part of the instrument where the neck joins body is in deep shadow, so that the correct outline can hardly be distinguished, being almost hidden by hand on one side and drapery on the other.

The barbiton, as pictured here, had probably undergone considerable modification at the hands of the Greeks and had diverged from the archetype. The barbiton, however, although it underwent many changes, retained until the end the characteristics of the instruments of the Greek lyre whose strings were plucked, whereas the rebab was sounded by means of the bow at the time of its introduction into Europe. At some period not yet determined, which we can but conjecture, the barbiton approximated to the form of the large lute (q.v.). An instrument called barbiton was known in the early part of the 16th and during the 17th century. It was a kind of theobo or bass-lute, but with one neck only, bent back at right angles to form the head. Robert Fludd gives a detailed translation of it with an illustration:—"In instrumenta non nulla barbito simillima effixissent sius modi sunt illa quae vulgo appellatur theorb, quae sonos graviores reddunt chordasque nervosae habent." The people called it theoebor, but the scholar having identified it with the instrument of classic Greece and Rome called it barbiton. The barbiton had nine pairs of gut strings, each pair being in unison. Dictionaries of the 18th century support Fludd's use of the name barbiton. G. B. Doni mentions the barbiton, defining it in his index as "Barbitos seu major chelys italicze rubaba, and deriving it from lyre and citara in common with testudines, tiorbas and all tortoise-shell instruments. C. Perrault, writing in the 18th century, states that "les modernes appellent notre lub barbiton" (the moderns call our lute barbiton). Constantijn Huygens declares that he learnt to play the barbiton in a few weeks, but took two years to learn the cittern. The barbat was a variety of rebab (q.v.), a bass instrument, differing only in size and number of strings. This is quite in accordance with what we know of the nomenclature of musical instruments as used by the Persians and Arabs, with whom a slight deviation in the construction of an instrument can carry a new name. The word barbat applied to the barbiton is said to be derived from a famous musician living at the time of Chosroes II. (A.D. 590-628), who excelled in playing upon the instrument. From a later translation of part of the same authority into German we obtain the following reference to Persian musical instruments: "Die Sänger stehen bei seinem Gastmahl; in ihrer Barbiton(1) und Leyer(2) und Laute(3) und Flöte(4) und Def (Handpauke)." Mr Ellis, of the Oriental Department of the British Museum, has kindly supplied the original Persian names translated above, i.e. (i) barbat, (ii) chang, (iii) rubab, (iv) nei. The barbut and rubab thus were different instruments as late as the 19th century in Persia. There were but slight differences if any between the archetypes of the pear-shaped rebab and of the lute before the application of the bow to the former—both had vaulted backs, body and neck in one, and gut strings plucked by the fingers. (K. S.)

BARBIZON, a French village, near the forest of Fontainebleau, which gave name to the "Barbizon school" of painters, whose leaders were Corot, Rousseau, Millet and Daubigny, together with Diaz, Dupré, Jacque, Franquais, Harpiniques and others. They put aside the conventional idea of "subject" in their pictures of landscape and peasant life, and went direct to the fields and woods for their inspiration. The distinctive note of the school is seen in the work of Rousseau and of Millet, each of whom, after spending his early years in Paris, made his home in Barbizon. Unappreciated, poor and neglected, it was not until after years of struggle that they attained recognition and success. They both died at Barbizon—Rousseau in 1867 and Millet in 1875. It is difficult now to realize that their work, so unaffected and beautiful, should have been so hardly received. To understand this, it is necessary to remember the conflicts that existed between the classic and romantic schools in the first half of the 19th century, when the classicists, followers of the tradition of the art of the Ancients, were expected to give way to the romantic movement. (J.H.)

David, were the predominant school. The romantic movement, with Géricault, Bonington and Delacroix, was gaining favour. In 1824 Constable's pictures were shown in the Salon, and confirmed the younger men in their resolution to abandon the lifeless pedantry of the schools and to seek inspiration from nature. In those troubled times Rousseau and Millet unburdened their souls to their friends, and their published lives contain many letters, some extracts from which will express the ideals which these artists held in common, and show clearly the true and firmly-based foundation on which their art stands. Rousseau wrote, "It is good composition when the objects represented are not there solely as they are, but when they contain under a natural appearance the sentiments which they have stirred in our souls. . . . For God's sake, and in recompense for the life He has given us, let us try in our works to make the manifestation of life our first thought: let us make a man breathe, a tree really vegetate." And Millet—"I try not to have things look as if chance had brought them together, but as if they had a necessary bond between themselves. I want the people to belong to their station, so that imagination cannot conceive of their ever being anything else. People and things should always be there with an object. I want to put strongly and completely all that is necessary, for I think things weakly said might as well not be said at all, for they are, as it were, deflowered and spoiled—but I profess the greatest horror for uselessness (however brilliant) and filling up. These things can only weaken a picture by distracting the attention toward secondary things." In another letter he says—"Art began to decline from the moment that the artist did not lean directly and naively upon impressions made by nature. Cleverness naturally and rapidly took the place of, nature, and decadence then began. . . . At bottom it always comes to this: a man must be moved himself in order to move others, and all that is done from theory, however clever, can never attain this end, for it is impossible that it should have the breath of life." The ideas of the Realistic school" only gradually obtained acceptance, but the chief members of it now rank among the greater artists of their time.

See D. Croll Thomson, The Barbizon School (1891), with a full list of the French authorities to be consulted; Jules Breton, Nos peintres du siècle, Paris, 1900.

BARBON, NICHOLAS (c. 1640–1698), English economist, probably the son of Praise-god Barbón, was born in London, studied medicine at Leiden, graduated M.D. at Utrecht in 1661, and was admitted an honorary fellow of the College of Physicians in 1664. He took a considerable part in the rebuilding of London after the great fire of 1666, and has a claim to be considered the instigator of fire-insurance in England, which he started somewhere about 1680. He was M.P. for Bramber in 1690 and 1695. He founded a land bank which, according to contemporaries, was fairly successful and was united with that of John Briscoe in 1696. He died in 1698. His writings are interesting as expressing views much in advance of his time and very akin to those of modern times on such important topics as value, rent and foreign trade. The more important were Apology for the Builder; or a Discourse showing the Cause and Effects of the Increase of Building (1683); A Discourse of Trade (1660); and A Discourse Concerning Coining the New Money Lighter (1663).

BARBON (Barebone or Barebones), PRAISE-GOD (c. 1596–1679), English leather-seller and Fifth Monarch man, was admitted freeman of the Leathersellers Company on the 20th of January 1623 and liveryman on the 13th of October 1634. About the same time he became minister to a congregation which assembled at his own house, "The Lock and Key," in Fleet Street, where his preaching attracted large audiences. The exact nature of his religious opinions is not perfectly clear. He is styled by his enemies a Brownist and Anabaptist, i.e. probably Baptist, but he wrote two books in support of paedo-baptism, and his congregation had separated from a larger one of Baptists on that point of controversy. Later he belonged to the sect of Fifth Monarchy men. He was the object of the abuse and ridicule of the opposite party, and his meetings were frequently disturbed by riots. On the 20th of December 1641 his house was stormed by a mob and he narrowly escaped with his life. Barbón, who was a man of substantial means, was summoned by Cromwell on the 6th of June 1653 as a member for London to the assembly of nominees called after him in derision Barebone's Parliament. His name is occasionally mentioned, but he appears to have taken no part in the debates. In 1660 he showed great activity in endeavouring to prevent the Restoration. He published Needham's book, News from Brussels in a Letter from a Near Attendant on His Majesty's Person . . ., which contained valuable anecdotes relating to Charles's morals, and on the 9th of February he presented the petition to the Parliament, which proposed that all officials should abjure the Stuarts, and all publicly proposing the Restoration should be deemed guilty of high treason. His conduct drew upon him several royalist attacks. On the 31st of March he was obliged to sign an engagement to the council not to disturb the peace, and on the 26th of November 1661 he was arrested, together with John Wildman and James Harrington, and was imprisoned in the Tower till the 27th of July 1662, when he was released on bail. Barbón, who was married, was buried on the 5th of January 1680. He was the author of A Discourse tending to prove . . . Baptism . . . to be the ordinance of Jesus Christ. As also that the Baptism of Infants is wearisome (1642), the preface of which shows a spirit of wide religious tolerance; and A Reply to the Frivolous and Imperfect answer of R. B. and E. B. to the Discourse of P. B. (1643).

BARBOUR, JOHN (?1316–1395), Scottish poet, was born, perhaps in Aberdeenshire, early in the 14th century, approximately 1320. In a letter of safe-conduct dated 1357, allowing him to go to Oxford for study, he is described as archdeacon of Aberdeen. He is named in a similar letter in 1364 and in another in 1368 granting him permission to pass to France, probably for further study, at the university of Paris. In 1372 he was one of the auditors of exchequer, and in 1373 a clerk of audit in the king's household. In 1375 (he gives the date, and his age as 60) he composed his best known poem, The Brus, for which he received, in 1377, the gift of ten pounds, and, in 1378, a life-pension of twenty shillings. Additional rewards followed, including the renewal of his exchequer auditorship (though he may have continued to enjoy it since his first appointment) and ten pounds to his pension. The only biographical evidence of his closing years is his signature as a witness to sundry deeds in the "Register of Aberdeen" as late as 1392. According to the obit-book of the cathedral of Aberdeen, he died on the 13th of March 1395. The state records show that his life-pension was not paid after that date.

Considerable controversy has arisen regarding Barbour's literary work. If he be the author of the five or six long poems which have been ascribed to him by different writers, he adds to his importance as the father of Scots poetry the reputation of being one of the most voluminous writers in Middle English, certainly the most voluminous of Scots poets. There are the

(1) The Brus, in twenty books, and running to over 13,500 four-accent lines, in couplets, is a narrative poem with a purpose partly historical, partly patriotic. It opens with a description of the state of Scotland at the death of Alexander III. (1286) and concludes with the death of Douglas and the burial of the Bruce's heart (1332). The central episode is the battle of Bannockburn. Patriotic as the sentiment is, it is in more general terms than is found in later Scots literature. The king is a hero of the chivalric type common in contemporary romance; freedom is a "noble thing" to be sought and won at all costs; the opponents of such freedom are shown in the dark colours which history and poetic propriety require; but there is none of the complacency of the merely provincial habit of mind. The lines do not lack vigour; and there are passages of high merit, notably the oft-quoted section beginning "Al fredome is a noble thing." Despite a number of errors of fact, notably the confusion of the three Brus in the person of the hero, the poem is historically trustworthy as compared with contemporary verse-chronicle, and especially with the Wallace of the next century.
has doubted Barbour's authorship of the Brus, but argument has been attempted to show that the text as we have it is an
edited copy, perhaps by John Ramsay, a Perth scribe, who wrote out the two extant texts, preserved in the Advocates' library, and in the library of St John's College, Cambridge. Extensive portions of the poem have been incorporated by Wyntoun (q.v.) in his Chronicle. The first printed edition extant is Charteris's (Edinburgh, 1571); the second is Hart's (Edinburgh, 1616).

(3) Wyntoun speaks (Chronicle III. iii.) of a "Tretis" which Barbour made by way of "a genealogy" of "Brutus lynagis"; and elsewhere in that poem there are references to the arch-
deacon's "Stewartis Oryginale." This "Brut" is unknown; but the reference has been held by some to be (3) a Troy-book, based on Guido da Colonna's Historia Destructionis Troiae. Two fragments of such a work have been preserved in texts of Lydgate's Troy-book, the first in MS. Camb. Univ. Lib. Kk. v. 30, the second in the same and in MS. Douce 148 in the Bodleian library, Oxford. This ascription was first made by Henry Bradshaw, the librarian of Cambridge University; but the consensus of critical opinion is now against it. Though it were proved that these Troy fragments are Barbour's, there remains the question whether their identification with the book on the Stewart line is justified. The scale of the story in these fragments forces us to doubt this identification. They contain 3138 = 5713 lines and are concerned entirely with "Trojan" matters. This would be an undue advance in a Scottish "genealogy." The work was added to the list of Barbour's works by the discovery in the university library of Cambridge, by Henry Bradshaw, of a long Scots poem of over 33,000 lines, dealing with Legends of the Saints, as told in the Legenda Aurea and other legends. The general likeness of this poem to Barbour's accepted work in verse-length, dialect and style, and the facts that the lives of English saints are excluded and those of St Machar (the patron saint of Aberdeen) and St Ninian are inserted, made the ascription plausible. Later criticism, though divided, has tended in the contrary direction, and has based its strongest negative judgment on the consideration of rhymes, assonance and vocabulary (see bibliography). That the "district" of the author is the north-east of Scotland cannot be doubted in the face of a passage such as this, in the fourteenth

For Barbour's life see Exequyer Rolls of Scotland, ii. and iii.; Registrum Episcopatus Aberdonensis (Spalding Club); Rymers Foedera.

BARBUDA, an island in the British West Indies. It lies 23° 40' N. of Antigua, of which it is a dependency, in 17° 36' W. and 61° 43' W., and it has an area of 62 sq. m. (1901) 775. It is flat and densely wooded. On the western side there is a large lagoon, separated from the sea by a spit of sand. The part of the island under cultivation is very fertile, and the air is remarkable for its purity. Cattle and horses are bred and wild deer are still found. Salt and phosphates of lime are exported. The island was annexed by Great Britain in 1628 and was bestowed in 1680 upon the Cordrington family who, for more than 200 years, held it as a kind of feudal fief.

BARBY, a town of Germany, in the kingdom of Prussia, on the left bank of the Elbe, 82 m. S.W. of Berlin on the direct railway to Cölesel. Pop. (1900) 5136. It has two evangelical churches and a seminary for school teachers, which is housed in the former castle of the lords of Barby. The industries are mainly agricultural, but there are sugar factories and breweries. Here from 1749 to 1809 was a settlement of the Herrnhut evangelical brotherhood.

BARCA (mod. Meri), an ancient city founded in the territory of Cyrene in the middle of the 6th century B.C. Rising quickly to importance it became a rival of the older city, and gave its name to the western province of the latter's territory. The name as a provincial designation is still in occasional use, but is now applied to all the province of Benghazi. Barca is said to have owed its origin to Greek refugees flying from the tyranny of Arcaisius II. (see Cyrene), but it is certain that it was rather a Libyan than a Greek town at all times. A Persian force invited by the notorious Phretetima, mother of Arcaisius III., in revenge for Barcan support of a rival faction, sacked it towards the close of the 3rd century B.C. and deported a number of its inhabitants to Bactria. Under Ptolemaic rule it began to decline, like Cyrene, and its port Polinoma (Comita) took its place: but after the German conquest (A.D. 641) it became the chief place of the Cyrenaeans for a time and a principal station on the Kairawan road. Though now a mere village, Meri is still the chief centre of administration inland, and has a fort and small garrison. No ruins of earlier period than the late Roman and early Arab seem to be visible on the site. The latter lies, like Cyrene, about ten miles from the coast on the crest of Jebel Akhdar, here sunk to a low downland. It owed its early prosperity to its easy access to the sea, and to the fact that natural conditions in Cyrenaica and the
BARCAROLE—BARCELONA

391

Sahebra behind it, tend to divert trade to the west of the district—a fact which is exemplified by the final survival of Berenice (mod. Benedetti). Mer stands in a rich but ill-cultivated stretch of red soil.

BARCAROLE, or BARCAROLLE (Ital. barcarola, a boat-song), properly a musical term for the songs sung by the Venetian gondoliers, and hence for an instrumental or vocal composition, generally in 6–8 time, written in imitation of their characteristic rhythm.

BARCELONA, a maritime province of north-eastern Spain, formed in 1833 out of districts belonging to the ancient kingdom of Catalonia, and bounded on the N.E. and E. by Gerona; S. by the Mediterranean Sea; S.W. by Tarragona; and W. and N.W. by Lérida. Pop. (1900) 1,054,514; area 2968 sq. m. Apart from a few tracts of level country along the coast and near Igualada, Manresa, Sabadell and Vich, almost the whole surface consists of mountain ranges, often densely wooded, rich in minerals and intersected by deep ravines. These ranges are outliers of the Pyrenees, which extend along the eastern frontier, forming the lofty Sierra del Cadí with the peak of Tosa (8317 ft.). Towards the sea, the altitudes become gradually less, although not with a uniform decrease; for several isolated peaks, and minor ranges such as Montserrat and Monseny rise conspicuously amid the lower summits to a height of 4000–6000 ft. The central districts are watered by the Llobregat, which rises at the base of the Sierra del Cadí, and flows into the sea near Barcelona, the capital, after receiving many small tributaries. The river Ter crosses the eastern extremity of the province.

Barcelona can be divided into three climatic zones; a temperate one near the sea, where even palm and orange trees grow; a colder one in the valleys and plains, more inland; and a colder still among the mountains, where not a few peaks are snow-clad for a great part of the year. Agriculture and stock-keeping are comparatively unimportant in this province, which is the centre of Spanish industry and commerce. In every direction the country looks like a veritable hive of human activity and enterprise, every town and village full of factories, and alive with the din of machinery. Lead, zinc, lignite, coal and salt are worked, and there are numerous mineral springs; but the prosperity of the province chiefly depends on its transit trade and manufactures. These are described in detail in articles on the chief towns. Barcelona (pop. 1900, 533,000), Badalona (19,240), Cardona (385), Igualada (10,442), Manresa (23,252), Mataró (10,704), Sabadell (23,204), Tarrasa (15,036), Vich (11,628) and Villanueva y Geltrú (11,856). Berga (540), the Roman Castrum Bergium, on the Llobregat, is the home of the Catalanian cotton industry. None of the rivers is navigable, and the roads are in general indifferent and insufficient. The province is better off in regard to railways, of which there are 340 m. Important lines radiate from the city of Barcelona north-east along the coast to Gerona and to Perpignan in France; south-west along the coast to Tarragona and Valencia; and west to Saragossa and Madrid. Several local railways link together the chief towns of the province. For a general description of the province and for the history of this region see CATALONIA. The population is greater and increases more rapidly than that of any other Spanish province, a fact due not to any large excess of births over deaths, but to the industrial life which attracts many immigrants. In the last quarter of the 19th century the increase exceeded 200,000, while the average yearly number of emigrants was below 2000. In point of education this province is quite among the first in Spain, and as far back as 1880 there were 97,077 children enrolled on the school registers; the figures have since steadily increased.

BARCELONA, formerly the capital of Catalonia, and since 1833 the capital of the province of Barcelona in eastern Spain, in 4° 25' N. and 2° 11' E., on the Mediterranean Sea, and at the head of railways from Madrid, Saragossa, and Perpignan in France. Pop. (1900) 533,000. Barcelona is a flourishing city and the principal seaport of Spain. It is built on the sloping edge of a small plain between the rivers Besòs, on the north, and Llobregat, on the south. Immediately to the south-west the fortified hills of Montjuich rise to an altitude of 650 ft., while the view is bounded on the west by the heights which culminate in Tibidabo (1745 ft.), and on the north-east by the Montaña Mata. The greater part of the space thus enclosed is occupied by comparatively modern suburbs and gardens of almost tropical luxuriance, strongly contrasting with the huge factories and busy port of the original city in their midst.

Barcelona was formerly surrounded by a strong line of ramparts, and defended, or more correctly, overawed by a citadel on the north-east, erected in 1715 by Philip V.; but these fortifications being felt as a painful restriction on the natural development of the city, were, in spite of the opposition of the central government, finally abolished by the local authorities in 1845. The walls of the moat were utilized for the cellars of the houses which soon occupied the site of the ramparts, and the ground, which had been covered by the citadel, was laid out in gardens. A rapid extension of the city to the north-west took place, and in 1860 an elaborate plan for the laying out of new districts received the royal sanction. Barcelona thus comprises an old town, still consisting for the most part of irregular and narrow streets, and a newer district built with a more symmetrical and precision of a promenaded scheme. The buildings of the old town are chiefly of brick, from four to five storeys in height, with flat roofs, and other oriental peculiarities; while in the new town hewn stone is very largely employed, and the architecture is often of a modern English style. To the east, on the tongue of land that helps to form the port, lies the suburb of Barceloneta. It owes its origin to the marquis de la Mina, who, about 1754, did much for the city, and is regularly laid out, the houses being built of brick after a uniform pattern. The main street or axis of the old town is the Rambla, which has a fine promenade planted with plane-trees running down the middle, and contains the principal hotels and theatres of the city. The most important suburbs are Gràcia, Las Corts de Sarríà, Horta, San Andrés de Palomar, San Gervasio de Cassolas, San Martín de Provenzals and Sans. Exclusive of these, the city contains about 334,000 inhabitants, an increase of nearly 156,000 since 1857. Large numbers of immigrants artizans joined the population during the latter half of the 19th century, attracted by the great development of industry. Barcelona is the see of a bishop, and, like most Spanish towns, has a large number of ecclesiastical buildings, though by no means so many as it once possessed. No fewer than eighteen convents were still standing in 1873. The cathedral, erected between 1298 and 1448 on Monte Taber, an oval hill which forms the highest point of the Rambla, is one of the finest examples of Spanish Gothic; although it is not designed on a great scale and some parts have been freely modernized. It contains the early 14th-century tomb of Santa Eulalia, the patron saint of the city, besides many other monuments of artistic or historical interest. Its stained glass windows are among the finest in Spain, and it possesses archives of great value. Santa Maria del Mar, Santa Ana, Santos Just y Pastor, San Pedro de las Puellas, and San Pablo del Campo are all classic examples of the art of the period.

The educational institutions of Barcelona have from an early period been numerous and important. The university (Universidad Literaria), which was originally founded in 1430 by the magistracy of the city, and received a bull of confirmation from Pope Nicholas V. in 1450, possessed at that time four faculties and thirty-one chairs all endowed by the corporation. It was suppressed in 1714, but restored in 1841, and now occupies an extensive building in the new town. There are, besides, an academy of natural sciences, a college of medicine and surgery—confirmed by a bull of Benedict XIII. in 1400—an academy of fine arts, a normal school, a theological seminary, an upper industrial school, an institution for the education of deaf-mutes, a school of navigation and many minor establishments. Gratuitous instruction of a very high order is afforded by the Board of Trade to upwards of 2000 pupils. The principal charitable foundations are the Casa de Caridad or house of charity, the hospital general, dating from 1401, and the foundling hospital. The principal civic and commercial buildings are the
BARCELONA

Casa Consistorial, a fine Gothic hall (1360–1378), the Lonja or exchange (1383), and the Aduana or custom-house (1702). At the seaward end of the Rambla is a large ancient structure, the Atrazanas or Arsenaus, which was finished about 1442, and partly demolished in the 19th century to give a better view to the promenade. Remains of the former royal state of Barcelona are found in the Palacio Real of the kings of Aragon and the Palacio de la Reina. At the highest part of the city, in the Calle del Paradis, are some magnificent columns, and other Roman remains, which, however, are hidden by the surrounding buildings. Means of public recreation are abundantly supplied. There are many theatres, the two most important being the Teatro Principal, and the Teatro del Liceo, a very fine building, originally erected in 1845 on the site of a convent of Trinitarian monks. The number of restaurants and similar places of evening resort is very great, and there are several public courts where the Basque game of pelota can be witnessed.

The so-called port of Barcelona was at first only an open beach, on the east, slightly sheltered by the neighbouring hills, but at an early period the advantage of some artificial protection was felt. In 1438 Don Alfonso V. granted the magistracy a licence to build a mole; and in 1474 the Moll de Santa Creu was officially begun. Long after this, however, travellers speak of Barcelona as destitute of a harbour; and it is only in the 17th century that satisfactory works were undertaken. Until modern times, the city was not in a position to furnish the open sea by a sand-bank, which rendered the entrance of large vessels impossible. An extension of the former mole, and the construction of another from the foot of Montjuich, have embraced a portion of the sea outside of the bank, and a convenient shelter is thus afforded for the heaviest battleships. From 1873 the work of extension and improvement was carried on systematically, with the addition of new quays, greater storage room, and better means for handling cargo. After thirty years of steady development, further plans were approved in 1903. At this time the port included an inner harbour, with a depth of 18 to 30 ft. at low tide, and an outer harbour with a depth of 20 to 35 ft. In the following year 8075 vessels of nearly 5,000,000 tons entered the port. Barcelona is well supplied with inland communication by rail, and the traffic of its streets is largely facilitated by tramway lines running from the port as far as Gràcia and the other chief suburbs.

* Barcelona has long been the industrial and commercial centre of eastern Spain—a pre-eminence which dates from the 12th and 13th centuries. It received a temporary check from the disasters of the Spanish-American War of 1898; but less than a year later it paid about 35,000,000 dollars in industrial and commercial taxes, more than 31% of the total amount thus collected in the kingdom, and within five years it had become a port of regular call for thirty-five important shipping companies. It also contained the head offices of thirteen other lines, notably those of the Transatlantic Mail Company, which possessed a fleet of twenty-five fine steamers. Trades and industries give occupation to more than 150,000 hands of both sexes. The spinning and weaving of wool, cotton and silk are the principal industries, but the enterprising spirit of the Catalans has compelled them to try almost every industry in which native capital could attempt to compete with foreign, especially since the institution of the protectionist tariffs of 1892. The native manufacturers are quite able to compete in peninsular markets with foreign rivals. This prosperity has been in part due to the great development of means of communication around the city and in the four Catalan provinces. Comestibles, raw materials, and combustibles form the greater part of the imports, but this great manufacture also imports a considerable quantity of foreign manufactured goods. The principal exports are wines, cereals, olive-oil, cotton goods, soap, cigarette-paper, furniture and barrels, boots, shoes and leather goods, and machinery.

Barcelon, the ancient name of the city, is usually connected with that of the Carthaginian Hamilcar Barca, its traditional founder in the 3rd century B.C. After the Roman conquest, it received from Augustus (27 B.C.–A.D. 14) the name of Julia Faventia (afterwards Augusta and Pia), with the status of a Roman colony; and thenceforward it rapidly grew to be the leading mart of the western Mediterranean, rivalling Tarraco (Tarragona) and Massilia (Marseille) as early as the 2nd century A.D. As its remains testify, the Roman city occupied Monte Taber. The bishopric of Barcelona was founded in 343. In 475 and 531, the Visigoths chose Barcelona as their temporary capital; in 540 and 599 church councils were held there. Barcino or Bardaluna, as it was then called, was captured by the Moors in 713, and in 801 it passed, with the rest of Catalonia, under the dominion of the Franks. From 874 the counts of Barcelona ruled as independent monarchs. But the accession of larger resources due to the union between Catalonia and Aragon in 1149, brought the city to the zenith of its fame and wealth. Its merchant ships vied with those of Genoa, Venice and Ragusa, trading as far west as the North Sea and the Baltic, and as far east as Alexandria. In 1258 James I. of Aragon empowered Barcelona to issue its famous Consulado del Mar, a code of maritime law recognized as authoritative by many European states. Consuls represented Barcelona at the principal commercial centres on or near the Mediterranean; and the city was among the first communities to adopt the practice of marine insurance. But the union of Castile and Aragon in 1470 favoured other cities of Spain at the expense of Barcelona, whose commercial supremacy was transferred to the ports of Spain by the Union of Tolentino in 1478. The citizens attributed their misfortunes to the “Castilians” governing a strong party among them, but sources have annexation by France. In 1650 Barcelona was the centre of the Catalan revolution against Philip IV., and threw itself under French protection. In 1652 it returned to its allegiance, but was captured by the duke of Vendôme in 1667. At the peace of Ryswick, in the same year, it was restored to the Spanish monarchy. During the War of the Succession (1701–1714) Barcelona adhered to the house of Austria. The seizure of Montjuich in 1705, and the subsequent capture of the city by the earl of Peterborough, formed one of his most brilliant achievements. In 1714 it was taken after a obstinate resistance by the duke of Berwick in the interests of Philip V., and at the close of the war was reluctantly reconciled to the Bourbon dynasty. In 1800 the French invaders of Spain obtained possession of the fortress and kept the city in subjection until 1814. Since then it has shared in most of the revolutionary movements that have swept over Spain, and has frequently been distinguished by the violence of its civic combotions. For the historic antagonism between the Catalans and the other inhabitants of Spain was strengthened by the religious differences between the two races. Among the enterprising and shrewd Catalans, who look upon their native province as a part of the national dominion, and reserve all their sympathies for the Provençal neighbour, whom they so nearly resemble in race, language and temperament, French influence and republican ideals spread rapidly; taking the form partly of powerful labour and socialist organizations, partly of less reputable bodies, revolutionary and even anarchic. Strikes are very common, seventy-three having occurred in such a year of comparative quiet as 1903; but the causes of disturbance are almost as often political as economic, and the annals of the city include a long list of revolutionary riots and bomb outrages. A strange contrast is presented by the co-existence of these turbulent elements with the more old-fashioned Spanish society of Barcelona. Church festivals, civic and ecclesiastical processions are almost as animated and picturesque as in Seville itself; and many medieval customs continue to flourish side by side with the most modern features of industrial life, giving to Barcelona a character altogether unique among Spanish cities.

The literature relating to Barcelona is extensive. For a general description of the city see Coster, La antigua y moderna, two illustrated folio volumes (Madrid, 1850); and J. Artigas y Feiner, Guía itineraria de Barcelona (Barcelona, 1888). For the antiquaries, see S. Sampere, Topografía antigua de Barcelona (1898). The economic history of the city is dealt with by A. Capmany in his Memorias históricas sobe la marina, comercio, y ajares de la antigua ciudad de Barcelona (Madrid, 1779–1792); and, for its political history, the same work should be consulted, together with Historias e conquistas de los comtes de Barcelona, by T. Tomich (Barcelona, 1888), and the Colección de documentos inéditos de los Arxiv
BARCELONA—BARCLAY, A. 393

municipal de la ciutat de Barcelona (Barcelona, 1892). The spread of the revolutionary movement is traced by M. Gil Maestre, in his El Anarquismo en España, y el especial de Barcelona (Madrid, 1897), and in his La Criminalidad en Barcelona (Barcelona, 1886).

BARCELONA, a town and port of Venezuela, capital of the state of Bermudez, on the Neveri river, 3 m. from its mouth and 12 m. by rail from the port of Guanta, which has superseded the incommodeous river port in the trade of this district. Pop. (est. 1904) 13,000. Built on the border of a low plain and having a mean annual temperature of 82° F., the town has the reputation of being unhealthy. There are salt works and important coal deposits. It is served by the lines of the National and Capricular, 12 m. distant by rail. Though the adjacent country is fertile, its prosperity has greatly declined, and the exports of coffee, sugar, cacao and forest products are much less important than formerly. The town dates from 1637, when it was located at the foot of the Cerro Santo and was called Nueva Barcelona; it reached a state of much prosperity and commercial importance before the end of the century. The War of Independence, however, and the chronic political disorders that followed nearly ruined its industries and trade.

BARCELONNETTE, a town in the department of Basses-Alpes, in the S.E. of France. Pop. (1906) 2075. It is built at a height of 1371 ft. on the right bank of the Ubaye river, on which it is the most important place. It is situated in a wide and very fertile valley, and is surrounded by many villas, built by natives who have made their fortune in Mexico, and are locally known as les Américains. The town itself is mainly composed of a long street (flanked by two others), which is really the road from Grenoble to Cuneo over the Col de l'Argentiére (6545 ft.). The only remarkable buildings in the town are a striking clock-tower of the 17th century (the remains of a Franciscan convent) and the Musée Chaubrand, which contains a very complete collection of birds, both European and extra-European.

Refounded in 1351 by Raymond Bérenger IV., count of Provence (he was of the family of the counts of Barcelona, whence the name of the town he rebuilt), Barcelonnette passed to Savoy in 1388 (formal cession in 1416), and in 1713 by the treaty of Utrecht was ceded to France in exchange for the valleys of Exilles, Fénestrelles, and Château Dauphin (Casteldelfino). It was the birth-place of J. A. Manuel (1775-1827), the well-known Liberal orator at the time of the Restoration of 1815, after whom the principal square of the town is named. See F. Arnaud, Barcelonnette et ses environs (Guide du C. A. F.) (1897) and Barcelonnette (1900). (W. A. B. C.)

BARCLAY, ALEXANDER, the younger (1497-1552), brother of William Barclay, was born about 1476. His nationality is matter of dispute, but William Bulley, who was a native of Ely, and probably knew him when he was in the monastery there, asserts that he was born "beyonde the cold river of Twede"; moreover, the spelling of his name and the occasional Scottish words in his vocabulary point to a northern origin. His early life was spent at Croydon, but it is not certain whether he was educated at Oxford or Cambridge. It may be presumed that he took his degree, as he uses the title of "Syr" in his translation of Sallust, and in his will he is called doctor of divinity. From the numerous incidental references in his works, and from his knowledge of European literature, it may be inferred that he spent some time abroad. Thomas Cornish, suffragan bishop in the diocese of Bath and Wells, and provost of Oriel College, Oxford, from 1493 to 1507, appointed him chaplain of the college of St Mary Ottery, Devonshire. Here he translated Sebastian Brant's Ship of Fools, and even introduced his neighbours into the satire:

"For as one can flatter, and beare a Hawk on his fist, / He shall be part of Honour, or Cist."

The death of his patron in 1513 apparently put an end to his connexion with the west, and he became a monk in the Benedictine monastery of Ely. In this retreat he probably wrote his eclogues, but in 1520 "Maistre Barkley, the Blacke Monk and Poete" was desired to devise "histories and convenient raisons to florishse the buildings and banquet house wthal" at the meeting between Henry VIII. and Francis I. at the Field of the Cloth of Gold. He at length became a Franciscan monk of Canterbury. It is presumed that he conformed with the change of religion, for he retained under Edward VI. the livings of Great Baddow, Essex, and of Wokey, Somerset, which he had received in 1546, and was presented in 1552 by the dean and chapter of Canterbury, and to the rectory of All Hallows, Lombard Street, London. He died shortly after this last preferment. He was buried in Surrey, where he was buried on the 19th of June 1552. All the evidence in Barclay's own work goes to prove that he was sincere in his reproof of contemporary follies and vice, and the gross accusations which John Bale brings against his moral character may be put down to his hatred of Barclay's cloth.

The Ship of Fools was as popular in its English dress as it had been in Germany. It was the starting-point of a new satirical literature. In itself a product of the medieval conception of the fool who figured so largely in the Shrovetide and other pageants, it differs entirely from the general allegorical satires of the preceding centuries. The figures are no longer abstractions; they are concrete examples of the folly of the bibliophile who collects books but learns nothing from them, of the evil judge who takes bribes to favour the guilty, of the old fool whom time merely strengthens in his folly, of those who are eager to follow the fashions, of the priests who spend their time in church telling "gestes" of Robin Hood and so forth. The spirit of the book reflects the general transition between allegory and narrative, morality and drama. The Norrenscissch of Sebastian Brant was essentially a moral conception and treatment, but his hundred and thirteen types of fools possessed, nevertheless, universal interest. It was in reality sins and vices, however, rather than follies that came under his censure, and this didactic temper was reflected in Barclay. The book appeared in 1494 with woodcuts said to have been devised and perhaps partly executed by Brant himself. In these illustrations, which gave an impulse to the production of "emblems" and were copied in the English version, there appears a humour quite absent from the text. In the Latin elegies of the Stultifera Nosi (1497) of Jacob Locher the book was read throughout Europe. Barclay's The Ship of Folyes of the Worldle was first printed by Richard Pynson in 1500. He says he translated "oute of Laten, Frenche, and Doche," but he seems to have been most familiar with the Latin version. He used a good deal of freedom in his translation, "sometime addynge, sometime detractinge and takenge awaye suche thinges as sereath me necessary and superflue." The fools are given a local colour, and Barclay appears as the unsparing satirist of the social evils of his time. At the end of his poem he assumes the name of "Iampan," and on his own to drive home the moral more surely. The poem is written in the ordinary Chaucerian stanza, and in language which is more modern than the common literary English of his day.

Certayne Ecloges of Alexander Barclay, Priest, written in his youth, were probably printed as early as 1513, although the earliest extant edition is that in John Cawood's reprint (1579) of the Ship of Fools. They form, with the exception of Henryson's Robin and Mokyn, the earliest examples of the English pastoral. The first three eclogues, in the form of dialogues between Cordon and Cornix, were borrowed from the Misericie Curialium of Aeneas Sylvius Piccolomini (Pope Pius II.), and contain an eulogy of John Alcock, bishop of Ely, the founder of Jesus College, Cambridge. The fourth is based on Mantuan's eclogue, De consuetudine dittum erga poetas, with large additions. It contains the "Description of the towre of Virtue and Honour," an elegy on Sir Edward Howard, lord high admiral of England, who perished in the attack on the French fleet in the harbour of Brest in 1513. The fifth, printed by Wynkyn de Worde, also without date, is entitled the Fyfte Elog of Alexandre Barclay of the Cytrest and the sorowe of the world. It is also based on Mantuan. Two shepherds, Amintas and Faustus, discuss the familiar theme of the respective merits of town and country life, and relate a quaint fable of the origin of the different classes of society. Barclay's pastorals contain many pictures of rustic life as he knew it. He describes for instance the Sunday games in the village, football, and the struggle for food at great feasts; 1

but his eulogies were, like his Italian models, also satires on social evils. The shepherds are rusticities of the Colin Clout type, and discuss the follies and promiscuities around them. Barclay had, however, no sympathy with the anti-clerical diatribes of John Skelton, whom he more than once attacks. Bale mentions an Ani-Skellomum which is lost. His other works are:—The Castell of Labour (Wynkyn de Worde, 1506), from the French of Pierre Gringoire; the Introductory to write and to pronounce Frenche (Robert Copland, 1521); The Myrour of Good Maners (Richard Pynson, not dated), a translation of the De quatuor virtutibus of Dominicus Mancinus; Cronycle compiled in Latyn by the renowned Sallust (Richard Pynson, no date), a translation of the Bellum Jugurthinum; The Lyfe of the glorious Martyr Saynt George (R. Pynson, c. 1530). The Lyfe of Soyunte Thomas, and Hayshon's Cronycle, both printed by Pynson, are also attributed to Barclay, but on very doubtful grounds. See T. H. Jamieson's edition of the Ship of Fools (Edinburgh, 1874), which contains an account of the author and bibliography of his works; and J. W. Fairholt's edition of The Cyscean and Æplodysman (Percy Soc. 1847), which includes large extracts from the other eclogues; also Zarinc's edition of Brant (Leipzig, 1854); and Dr Fedor Friedstutz, dansk skalman (Copenhagen, 1894), which contains the Faestum and other verse (1570). A prose version of Locher's Stultifera Navis, by Henry Watson, was printed by Wynkyn de Worde in 1518.

BARCLAY, JOHN (1582—1621), Scottish satirist and Latin poet, was born, on the 28th of January 1582, at Pont-à-Mousson, where his father William Barclay held the chair of civil law. His mother was a Frenchwoman of good family. His early education was obtained at the Jesuit College. While there, at the age of nineteen, he wrote a commentary on the Thebaid of Statius. In 1603 he crossed with his father to London. Barclay had persistently maintained his Scottish nationality in his French surroundings, and probably found in James's accession an opportunity which he would not let slip. He did not remain long in England, where he is supposed to have published the first part of the Satyricon, for in 1605 when a second edition of that book appeared in Paris, he was there, having already spent some time in Augers, and being now the husband of a French girl, Louise Debonaire. He returned to London with his wife in 1606, and there published his Sylva, a collection of Latin poems. In the following year the second part of the Satyricon appeared in Paris. Barclay remained on in London till 1616. In 1609 he edited the De Prostata Papae, an anti-papal treatise by his father, who had died in the preceding year, and in 1611 he issued an Apologia or "third part" of the Satyricon, in answer to the attacks of the Jesuits and others who were probably embittered by the tone of the earlier parts of the satire. A so-called "fourth part," with the title of Icon Animorum, appeared in 1614. James I. is said to have been attracted by his scholarship, but particulars of this, or of his life in London generally, are not available. In 1616 he went to Rome, for some reason unexplained, and there resided till his death on the 15th of August 1621. He appears to have been on better terms with the Church and notably with Bellarmine for in 1617 he issued, from a press at Cologne, a Parados et Societatis Jesu, which was a memorial of Protestants. The literary effort of his closing years was his best-known work the Argenis, completed about a fortnight before his death, which has been said to have been hastened by poison. The romance was printed in Paris in the same year.

Barclay's contemporary reputation as a writer was of the highest: by his strict scholarship and graceful style he has deserved the praise of modern students. The Satyricon, a severe satire on the Jesuits, is modelled on Petronius and catches his lightness of touch, though it shows little or nothing of the tone of its model, or of the unhestitating severity and coarseness of the humanistic satire of Barclay's age. The Argenis is a long romance, with a monitory purpose on the dangers of political intrigue, probably suggested to him by his experiences of the league in France, and by the catholic plot in England after James's accession. The work has been praised by all parties; and it enjoyed for more than a century after his death a remarkable popularity. Most of the innumerable editions are supplied with a key to the characters and names of the story. Thus Anoeritus is Clement VIII; Arx non cessa is the Tower of London; Hippophilus and Radiusobanes are the names of the kings of Spain; Hyansbe is Queen Elizabeth; Megurian, by an easy anagram, is Germany; Usinulca, by another, is Calvin. The book is of historical importance in the development of 17th-century romance, including especially Fénelon's Télémaque. Ben Jonson appears, from an entry at Stationers' Hall on the 2nd of October 1623, to have intended to make a translation. Barclay's shorter poems, in two books, were printed in the Delitiae Postorum Scotorum (Amsterdam, 1637, i. pp. 76—136). In the dedication, to Prince Charles of England, he refers to his earlier publication, the Sylva.

The best account of Barclay is the preface by Jules Dukas in his bibliography of the Satyricon (Paris, 1890). This supercedes the life in Bayle's Dictionary, which had been the sole authority. A "fifth part" of the Satyricon appears in most of the editions, by Alerophilius (Claude Morisot). For the Argenis, see the dissertation by J. Fouchet (Paris, 1874), and Dupond (Paris, 1875). The Icon Animorum was Englished by Thomas May in 1631 (The Mirror of Minde, or Barclay's Icon Animorum). Barclay's works have never been collected.

BARCLAY, JOHN (1734—1798), Scottish divine, was born in Perthshire and died at Edinburgh. He graduated at St Andrews, and after being licensed became assistant to the parish minister of Balmalcolm. He was called to the Kirk of Edinburgh to succeed his father, and in 1762 was appointed minister of Fettercairn, Cardine. In this parish he became very popular, but his presbytery the testimonials requisite in order to obtain another living. The refusal of the presbytery was sustained by the General Assembly, and Barclay thereupon left the Scottish church and founded congregations at Sauchburn, Edinburgh and London. His followers were sometimes called Bereans, because they regulated their conduct by a diligent study of the Scriptures (Acts xvi. 11). They hold a modified form of Calvinism.

His works, which include many hymns and paraphrases of the psalms, and a book called Without Faith, without God, were edited by J. Hymen and D. Mitchell, with a memoir of Barclay (1852). 

BARCLAY, ROBERT (1648—1690), one of the most eminent writers belonging to the Society of Friends, or Quakers, was born in 1648 at Gordonstown in Morayshire. His father had served under Gustavus Adolphus, and pursued a somewhat tortuous course through the troubles of the civil war. Robert was sent to finish his education in Paris, and it appears he was at one time inclined to accept the Roman Catholic faith. In 1667, however, he followed the example of his father, and joined the recently-formed Society of Friends. In 1670 he married a Quaker lady, Christian Mollison of Aberdeen. He was an ardent theological student, a man of warm feelings and considerable mental powers, and he soon came prominently forward as the leading apologist of the new doctrine, winning his spurs in a controversy with one William Mitchell. The publication of fifteen Theses Theologiae (1676) led to a public discussion in Aberdeen, each side claiming a victory. The most prominent of the Theses was that bearing on the subject of the immediacy of the revelation, in which the superiority of the inner light to reason or scripture is sharply stated. His greatest work, An Apology for the True Christian Divinity, was published in Latin at Amsterdam in 1676, and was an elaborate statement of the grounds for holding certain fundamental positions laid down in the Theses. It was translated by its author into English in 1678, and is "one of the most impressive theological writings of the century." Itbreathes a large tolerance and is still perhaps the most important manifesto of the Quaker Society. Barclay experienced to some extent the persecutions inflicted on the new society, and was several times thrown into prison. He travelled extensively in Europe (once with Penn and George Fox), and had several interviews with Elizabeth, princess palatine. In later years he had much influence with James II., who as duke of York had given to twelve members of the society a patent of the province of East New Jersey, Barclay being made governor (1682—88). He is said to have visited James with a view to making terms of accommodation with William of Orange,
BARCLAY, W.—BARDAISAN 395

whose arrival was then imminent. He died on the 3rd of
October 1690.

BARCLAY, WILLIAM (1564-1608) Scottish jurist, was born
in Aberdeenshire in 1564. Educated at Aberdeen University,
he went to France in 1573, and studied law under Cujas, at Bourges,
where he took his doctor's degree. Charles III., duke of Lorraine,
appointed him professor of civil law in the newly-founded
university of Pont-à-Mousson, and also created him councillor
of state and master of requests. In 1603, however, he was
obliged to quit France, having incurred the enmity of the Jesuits,
through his opposition to their proposal to admit his son John
(g.v.) a member of their society. Returning to England, he was
offered considerablepreferment by King James on condition of
becoming a member of the Church of England. This offer he
refused, and returned to France in 1604, when he was appointed
professor of civil law in the university of Angers. He died at
Angers in 1608. His principal works were *De Regno et Regali
Postenale, &c.* (Paris, 1600), a strenuous defence of the rights of
kings, in which he refutes the doctrines of George Buchanan,
*"Janius Brutus"* (Hubert Lanquet) and Jean Boucher, and
*De Postea Leges Papae, &c.* (London, 1609), in opposition to the
usurpation of temporal powers by the pope, which called forth
the celebrated reply of Cardinal Bellarmine; also commentaries
on some of the titles of the *Pandects*.

BARCLAY DE TOLLY, MICHAEL ANDREAS, called by the
Russians Michael, Prince Bogdanovich (1751-1818), Russian
field marshal, was born in Livonia in 1761. He was a descendant of
a Scottish family which had settled in Russia in the 17th century.
He entered the Russian army at an early age. In 1788-1789 he
served against the Turks, in 1790 and 1794 against the Swedes
and Poles. He became colonel in 1795 and major-general in
1799. In the war of 1806 against Napoleon, Barclay took a
distinguished part in the battle of Pultusk and was wounded at
Eylau, where his conduct won him promotion to the rank of
lieut.-general. In 1808 he commanded against the Swedes in
Finland, and in 1809 by a rapid and daring march over the frozen
Gulf of Bothnia he surprised and seized Umeo. In 1810 he was
made minister of war, and he retained the post until 1813.
In 1812 Barclay was given command of one of the armies operating
against Napoleon. There was very keen opposition to the appointment of a foreigner as commander-in-chief, and after he
was defeated at Smolensk the outcry was so great that he
resigned his command and took a subordinate place under the
veteran Kutusov. Barclay was present at Borodino, but left
the army soon afterwards. In 1813 he was re-employed in
the field and took part in the campaign in Germany. After
the battle of Bautzen he was reinstated as commander-in-chief of
the Russian forces, and in this capacity he served at Dresden,
Kulm and Leipzig. After the last battle he was made a count.
He took part in the invasion of France in 1814 and at Paris
received the baton of a field marshal. In 1815 he was again
commander-in-chief of the Russian army which invaded France,
and he was made a prince at the close of the war. He died at
Innsbruck on the 16th (30th) May 1818.

BARCOCHEBAS, BAR-COCHAB, or BAR KOKBA ("son of a
star"), the name given in Christian sources to one Simeon, the
leader in the Jewish revolt against Rome in the time of Hadrian
(a.d. 132-135). The name does not appear in the Roman
historians. In Rabbinic sources he is called Bar (Ben) Coziba,
"son of deceit," which perhaps reflects the later verdict of con-
demnation recorded after his failure (root כ"ש "to be false").
Cochab is, therefore, the name either of his father or of his home.
But it is recorded that the Rabbi Aqiba (g.v.), who recognized
him as Messiah, applied Num. xxiv. 17 to him, reading not
Cochab ("a star"), but Cosiba ("goes forth from Jacob"); but Bar-Cochab is a Messianic title of the "man of Cozeba"
(cf. Chron. iv. 22) whose original name was recalled by later
Rabbis with sinister intention. At first the Romans paid little
attention to the insurgents, who were able to strike coins in the
name of Simeon, prince of Israel, and Eleazar the priest, and
to persecute the Christians, who refused to join the revolt. But
Troops were collected and the various fortresses occupied by the
Jews were successively reduced. The end came with the fall of
Beth-thar (Bethar). Extraordinary stories were told of the
precursors of Barcochebas and of the ordinals to which he subjected
his soldiers in the course of training.

See Eusebius H.E. iv. 61; Dio Cassius xix. 12-14; Schürer, Gesch.

BARD, a word of Celtic derivation (Gaelic bard, Cymric bardh,
Irish bard) applied to the ancient Celtic poets, though the name is
sometimes loosely used as synonymous with poet in general.
So far as can be ascertained, the title bard, and some of the
privileges peculiar to that class of poets, are to be found only
among Celtic peoples. The name itself is traced by Clear in
his account of the manners and customs of Gaul and Britain, but
he appears to ascribe the functions of the bards to a section of the
Druids, with which class they seem to have been closely
connected. Later Latin authors, such as Lucan (Phar. p. 447),
Festus (De Verb. Sign. s.v.), and Ammianus Marcellinus (bk. xv.),
used the term Bardi as the recognized title of the national poets
or minstrels among the peoples of Gaul and Britain. In Gaul,
however, the institution soon disappeared; the purely Celtic
peoples were swept away by the waves of Latin and Teutonic
conquest, and finally settled in Wales, Ireland, Brittany and the
north of Scotland. There is clear evidence of the existence of
bards in all these places, though the known relics belong almost
equally to Wales and Ireland, where the institution was more
distinctively national. In Wales they formed an organized
society, with hereditary rights and privileges. They were treated
with the utmost respect and were exempt from taxes or military
service. Their special duties were to celebrate the victories of
their people and to sing hymns of praise to God. They thus
gave poetic expression to the religious and national sentiments of
the people, and therefore exercised a very powerful influence.
The whole society of bards was regulated by laws, said to have
been first distinctly formulated by Hywell Dha, and to have been
afterwards revised by Gruffyd ap Conan. At stated intervals
great festivals were held, at which the most famous bards from
the various districts met and contended in song, the umpires
being generally the princes and nobles. Even after the conquest
of Wales, these congresses, or Eisteddfodau, as they were called
(from the Welsh eistedd, to sit), continued to be summoned by
royal commission, but from the reign of Elizabeth the custom
has been allowed to fall into abeyance. They have not been since
supplied by royal authority, but were revived about 1822, and
are held regularly at the present time. In modern Welsh, a bard
is a poet whose vocation has been recognized at an Eisteddfod.
In Ireland also the bards were a distinct class with peculiar and
hereditary privileges. They appear to have been divided into
three great sections: the first celebrated victories and sang
hymns of praise; the second chanted the laws of the nation;
the third gave poetic genealogies and family histories. The
Irish bards were held in high repute, and frequently were brought
over to Wales to give instruction to the singers of that country.
In consequence, perhaps, of Lucan's having spoken of carmina
bardi, the word bard began to be used, early in the 17th century,
to designate any kind of a serious poet, whether lyric or epic,
and is so employed by Shakespeare, Milton and Pope. On the
other hand, in Lowland Scots it grew to be a term of contempt
and reproach, as describing a class of frenzied vagabonds.

See Ed. Jones, Relics of the Welsh Bards (1764); Walker, Memoirs
of the Welsh Bards (1802); Jones, Mythol. Archæology and
Wales (3 vols., 1801-1807); W. F. Slezer, Four Ancient Books of
Wales (2 vols., 1868).

BARDAISAN, an early teacher of Christianity in Mesopotamia,
the writer of numerous Syriac works which have entirely perished
(1 with one possible exception, the Hymn of the Soul in the Acts
of Thomas), and the founder of a school which was soon branded
as heretical. According to the trustworthy Chronicle of Edessa,
he was born in that city on the 11th Tammuz (July), a.d. 154.

1 The Book of the Laws of the Countries, referred to below, is the
work of a disciple of BarDAISan.
BARDEI—BARDESE

His parents were of rank and probably pagan; according to Barhebraeus, he was in youth a priest in a heathen temple at Malβig. Another probable tradition asserts that he shared the education of a royal prince who afterwards became king of Edessa—perhaps Abgar bar Manu, who reigned 202–217. He is said to have converted the prince to Christianity, and may have had an important share in christianizing the city. Epiphanius and Barhebraeus assert that he was first an orthodox Christian and afterwards an adherent of Valentianus; but Eusebius and the Armenian Moses of Chorene reverse the order, stating that in his later days he largely, but not completely, purged himself of his earlier errors. The earliest works attributed to him (by Eusebius and others) are polemical dialogues against Marcionism and other heresies; these were afterwards translated into Greek. He also wrote, probably under Caracalla, an apology for the Christian religion in a time of persecution. But his greatest title to fame was furnished by his hymns, which, according to St Ephrem, numbered 150 and were composed in imitation of the Davidic psalter. He thus became the father of Syriac hymnology, and from the favour enjoyed by his poems during the century and a half that intervened between him and St Ephrem we may conclude that he possessed original poetic genius. This would be clearly proved if (as is not unlikely) the beautiful Hymn of the Soul incorporated in the apocryphal Acts of the Martyrs could be regarded as proceeding from his pen; it is practically the only piece of real poetry in Syriac that has come down to us. Perhaps owing to the persecution under Caracalla mentioned above, Bardaisān for a time retreated into Armenia, and is said to have there preached Christianity with indifferent success, and also to have composed a history of the Armenian kings. Porphyry states that on one occasion at Edessa he interviewed an Indian deputation who had been sent to the Roman emperor, and questioned them as to the nature of Indian religion. He was undoubtedly a man of wide culture. He died (according to the patriarch Michael) in 222.

For our knowledge of Bardaisān’s doctrine we are mainly dependent on the hostile witness of St Ephrem, and on statements by Greek writers who had no acquaintance with his works in their original form. His teaching had certain affinities with gnosticism. Thus he certainly denied the resurrection of the body; and so far as we can judge by the obscure quotations from his hymns furnished by St Ephrem he explained the origin of the soul by a process of emanation from the supreme God whom he called “the Father of the living.” On the other hand, the dialogue known as the Book of the Laws of the Countries, which was written by a disciple and is quoted by Eusebius as a genuine exposition of the master’s teaching—while it recognizes the influence of the celestial bodies over the body of man and throughout the material sphere and attributes to them a certain delegated authority!—upholds the freedom of the human will and can in the main be reconciled with orthodox Christian teaching. On this M. Nau has based his effort (see Une Biographie inédite de Bardesane l’astrologue, Paris, 1897; Le Livre des lois des pays, Paris, 1899) to clear Bardaisān of the reproach of gnosticism, maintaining that the charge of heresy arises from a misunderstanding of certain astrological speculations. It must be admitted that it is impossible to reconstruct Bardaisān’s system from the few fragments remaining of his own work and therefore a certain verdict cannot be given. But the ancient testimony to the connexion of Bardaisān with Valentinianism is strong, and the dialogue probably represents a modification of Bardesanist teaching in the direction of orthodoxy. The later adherents of the school have moved towards a Manichean dualism.

The subject is exhaustively discussed in Hort’s article “Bardaisān” in Dict. Christ. Biog., and a full collection of the ancient testimonies will be found in Harnack’s Alchristliche Literatur, vol. i. pp. 184 ff. (N. M.)

BARDELI, CHRISTOPH GOTTFRIED (1761–1808), German philosopher, was born at Blaubeuren in Württemberg, and died at Stuttgart. His system has had little influence in Germany; Reinhold (q.e.) alone expounded it against the attacks of Fichte and Schelling. Yet in some respects his ideas opened the way for the later speculations of Schelling and Hegel. He dissented strongly from the Kantian distinction between matter and form of thought, and urged that philosophy should consider only thought in itself, pure thought, the ground or possibility of being. The fundamental principle of thought is, according to him, the law of identity; logical thinking is real thinking. The matter upon which thought operated is in itself indefinite and is rendered definite through the action of thought. Bardili worked out his idea in a one-sided manner. He held that thought in itself has no power of development, and ultimately reduced it to arithmetical computation. He published Grundriss der ersten Logik (Stuttgart, 1800); Über die Gesetze der Ideen-association (Tübingen, 1796); Briefe über den Ursprung der Metaphysik (Altona, 1798); Philosoph. Elementarlære (Landsbut, 1802–1806); Beiträge zur Beurteilung des gegenwärtigen Zustandes der Vernunftphilosophie (Landsbut, 1803).

BARDOUX, AGÉNOR (1829–1897), French statesman, was a native of Bourges. Established as an advocate at Clermont, he did not hesitate to proclaim his republican sympathies. In 1871 he was elected deputy of the National Assembly, and re-elected in 1876 and in 1877. In the chamber he was president of the group of the left centre, standing strongly for the republic but against anti-clericalism. After the coup d’état of the 16th of May, he was one of the leaders of the “363.” In the republican chamber elected after the 16th of May, he became minister of public instruction (December 1877), and proposed various republican laws, notably on compulsory primary education. He resigned in 1879. He was not re-elected in 1881, but in December 1882 was nominated for life. He wrote essays on Les Législati de leur influence sur la société française (1878); Le Comte de Montesquieu et le Galiaccisme (1881); and published in 1882 his Dix Années de vie politique.

BARDOWIEK, a village of Germany, in the Prussian province of Hanover, 3 m. N. of Lüneburg on the navigable Ilmeneu. Pop. 2000. Its trade consists entirely in agricultural produce. The Gothic parish church (c. 1400) incorporates remains of a cathedral of vast dimensions.

Bar doviek was founded in the 8th century by Charlemagne, who established a bishopric in it, and until its destruction by Henry the Lion in 1189, it was the most prosperous commercial city of northern Germany. The name is derived from the Longobardi, the tribe for whom it was the home and centre, and from it the colonization of Lombardy started.

BARDESE (i.e. "Bards’ Island"); cf. Anglesey, "Angles’ Island," Welsh, Ynys Enlli, "isle of the current"), an island at the northern extremity of Cardigan Bay. The "sound" between Aberdaron point and the island is some 4 m. wide. Bardse is included in Carnarvonshire, North Wales (but traditionally in S. Wales). On the N.W. side it has high cliffs. It is about 2½ m. long by ¾ m. broad, with an area of some 370 acres, a third of which is hilly. Barley and oats are grown. On the S.E. side is a fairly deep harbour. On the N.E. are the ruins of the tower of St Mary’s abbey (14th century). There is no Anglican church, the inhabitants being Dissenters. They are farmers and fishermen. The lighthouse, with fixed light, 140 ft. high and visible for 17 m., is locally celebrated. The rectory of Aberdaron (on the mainland, opposite Bardsey), Pennmachaon Llangedan/Llanywynhoed, in Lleyn (S. Carnarvonshire), belong to St John’s College, Cambridge. St Dubricius made the sanctuary famous, and died here in 612. Here was the burial-place of all the monks whose friends could afford to go thither with their bodies. All the great abbegs of England sent their quota. Roads to Bardsey—with the monks’ wells, found at intervals of 7 to 9 m. —run from north, east and south. The remnant of priests fled thither (after the great massacre of Bangor-is-coed in 613, by Ethelfride of Northumbria) by the road of the Rivals (Yn Efôl).
hill, S. Carnarvonshire, on which Pitsyll farm still gives food gratis to all pilgrims or travellers. A part of the isle is one great cemetery of about 3 to 4 acres, with rude, rough graves as close to each other as possible, with slabs upon them. Though Aberdaron rectory does not belong to the isle, the farm "Cwt" (Court), where the abbot held his court, still goes with Bardsey, which was granted to John Wynn of Bodvel, Carnarvonshire, after the little and partial sack of Norwich by the Puritans in the Civil War, passing through Mary Bodvel to her husband, the earl of Radnor, who sold it to Dr Wilson of York. The doctor, in turn, sold it to Sir John Wynn, of Glynnllifon and Bodfean Hall, Carnarvonshire. One of the Wynn's, the 3rd Baron Newborough, was, at his wish, buried here. The archaeology and history of the isle are voluminous. Lady Guest's 

Mabiongion translation (p. 115, ed. of 1838) gives an account of the (legendary) Bardsey House of Glass, into which Merlin (Myrdin) took a magic ring, originally kept at Caerleon-on-Usk.

**BAREGES**,
attached himself at first to the constitutional party; but he was
less known as a speaker in the Assembly than as a journalist.
His paper, however, the Point du Jour, according to Aulard,
owes its reputation not so much to its own qualities as to the
fact that the painter David, in his famous picture of the "Oath
in the Tennis Court," has represented Barère kneeling in the
corner and writing a report of the proceedings as though for
posterity. The reports of the debates of the National Assembly
in the Point du Jour, though not inaccurate, are as a matter of
fact very incompletely and very dry. After the flight of the king
to Varennes, Barère passed over to the republican party, though
he continued to keep in touch with the duke of Orleans, to whose
natural daughter, Paméla, he was tutor. Barère, however,
appears to have been wholly free from any guiding principle;
conscience he had none, and his conduct was regulated only by
the determination to be on the side of the strongest. After the
close of the National Assembly he was nominated one of the
judges of the newly instituted court of cassation from October
1791 to September 1792. In 1792 he was elected deputy to
the National Convention for the department of the Hautes-Pyrénées.
At first he voted with the Girondists, attacked Robespierre,
a "pygmy who should not be set on a pedestal," and at the trial
of the king voted with the Mountain for the king's death "with
out appeal and without delay." He closed his speech with a
sentence which became memorable: "the tree of liberty could
not grow if it were not watered with the blood of kings." Ap-
pointed member of the Committee of Public Safety on the 7th
of April 1793, he busied himself with foreign affairs; then,
joining the party of Robespierre, whose resentence he had
averted by timely flatteries, he played an important part in
the second Committee of Public Safety—after the 17th of July 1793
—voted for the death of the Girondists. He was thoroughly
unscrupulous, stopping at nothing to maintain the supremacy
of the Mountain, and rendered it great service by his rapid work,
by the telling phases of his oratory, and by his clear expositions
of the problems of the day. On the 9th Thermidor (July 27th,
1794) Barère hesitated, then he drew up the report outlawing
Robespierre. In spite of this, in Germinal of the year III.
(21st of March to the 4th of April 1795) the Thermidorsians
decreed the accusation of Barère and his colleagues of the Terror,
Collet d'Herbois and Billaud-Varenne, and he was sent to the
Isle of Oléron. He was removed to Saintes, and thence escaped
to Bordeaux, where he lived in concealment for several years.
In 1795 he was elected member of the Council of Five Hundred,
but was not allowed to take his seat. Later he was used as a
secret agent by Napoleon I., for whom he carried on a diplomatic
conduct in foreign countries. On the fall of Napoleon, Barère
played the part of royalist, but on the final restoration of the Bourbons
in 1815 he was banished for life from France as a regicide, and
then withdrew to Brussels and temporary oblivion. After
the revolution of July 1830 he reappeared in France, was reduced
by a series of lawsuits to extreme indigence, accepted a small
pension assigned him by Louis Philippe (on whom he had heaped
abuse and railing), and died, the last survivor of the Committee
of Public Safety, on the 13th of January 1841. (See also French
Revolution.)

The Mémoires de B. Barère, ... publiés par M.M. H. Carnot ...
et David (d'Aangers) ... préludé par un historique (1834-1844) are false, but contain valuable information; Carnot's Notice,
which is very good, was published separately in 1842. See F. A.
Aulard, Les Orateurs de la Constituante (Paris, 1882); Les Orateurs
(Edinburgh Review, vol. 79) is eloquent, but incorrect.

BARETTI, GIUSEPPE MARC'ANTONIO (1719-1789), Italian
critic, was born at Turin in 1719. He was intended by his father
for the profession of law, but at the age of sixteen fled from Turin
and went to Guastalla, where he was for some time employed in
a mercantile house. His leisure hours he devoted to literature
and criticism, in which he became expert. For many years he
led a wandering life, supporting himself chiefly by his writings.
At length he arrived in London, where he remained for a consider-
able time. He obtained an appointment as secretary to the
Royal Academy of Painting, and became acquainted with
Johnson, Garrick and others of that society. He was a frequent
visitor at the Thrales', and his name occurs repeatedly in
Berossu's Life. In 1760 he was tried for murder, having had
the misfortune to inflict a mortal wound with his fruit knife on
a man who had assaulted him on the street. Johnson among
others gave evidence in his favour at the trial, which resulted
in Baretti's acquittal. He died in May 1789. His first work
of any importance was the Italian Library (London, 1757), a
useful catalogue of the lives and works of many Italian authors.
The Lettere famigliari, giving an account of his travels through
Spain, Portugal and France during the years 1761-1765, were
well received, and when afterwards published in English (4 vols.,
1770), were highly commended by Johnson. While in Italy
on his travels Baretti set on foot a journal of literary criticism,
in which he gave the title of Frusta letteraria, the literary scourge.
It was published under considerable difficulties and was soon
discontinued. The criticisms on contemporary writers were
sometimes just, but are frequently disfigured by undue velle-
minence and coarseness. Among his other numerous works may
be mentioned a useful Dictionary and Grammar of the Italian
Language, and a dissertation on Shakespeare and Voltaire. His
collected works were published at Milan in 1838.

BARFLEUR, a small seaport of north-western France, over-
looking the Bay of the Seine, in the department of Manche,
243 m. N.E. of Valognes by rail. Pop. (1806) 1060. In
the middle ages Barfleur was one of the chief ports of embarkation
for England. In 1120 the "White Ship," carrying Prince William,
only son of Henry I., went down outside the harbour. About 2 m.
to the north is Cape Barfleur, with a lighthouse 235 ft. high.

BARFURUSH, a town of Persia, in the province of Mazandaran
in 36° 59' N. and 45° 42' E., and on the left bank of the river
Bawul (Babal), which is here crossed by a bridge of eight arches,
about 15 m. distant from the southern shore of the Caspian Sea,
where the small town of Meshed-i Sar serves as a port. It is
the commercial capital of Mazandaran, and 26 m. distant from Sari
and 90 m. from Teheran. Pop. about 50,000. Built in a low
and swampy country and approached by deep and almost
impassable roads, Barfurush would not seem at all favourably
situated for the seat of an extensive inland trade; it is, however,
peopled entirely by merchants and tradesmen, and is wholly
indebted for its present size and importance to its commercial
prosperity. The principal articles of its trade are rice and cotton,
some sugar cane (nâš shâkâr), flax (Kâthîn) and hemp (Kânâb)
are also grown. The town is of peculiar structure and aspect,
being placed in the midst of a forest of tall trees, by which
the buildings are partly surrounded, so that, except in the bazars,
it has no appearance of a populous town. The streets are broad and neat, though generally unpaved, and kept in good order. No ruins are to be seen as in other
Persian towns; the houses are comfortable, in good repair,
roofed with tiles and enclosed by substantial walls. There are
no public buildings of any importance, and the only places
of interest are the bazars, which extend fully a mile in length,
and consist of substantially built ranges of shops covered with
roofs of wood and tiles, and well stored with commodities.
There are about ten commodious caravanserais and a number of colleges
(mêdrêsseh), the place being as much celebrated for learning as
for commerce. On an island in a small lake east of the town
is a garden, called Bagh-i Shah (garden of the Shah), with ruined
palaces and baths. At Meshed-i Sar, the port, or roadstead of
Barfurush, the steamers of the Caucasus and Mercury Company
call weekly, and a brisk shipping trade is carried on between it
and other Caspian ports.

Barfurush was formerly called Mâmatir. The present name is
from a settlement called Barfurush-deh, which was added to the
old city A.D. 1012. (A.H.-S.)

BARGAIN 1 AND SALE, in English law, a contract whereby
property, real or personal, is transferred from one person—
called the bargainer—to another—called the bargainee—for a

1 From O. Fr. bargaìge, a word of doubtful origin, appearing in
many Romance languages, cf. Ital. bargagio; it is connected with
Late Lat. barcaniare, to traffic, possibly derived from bara, a barge.
valuable consideration; but the term is more particularly used
to describe a mode of conveyance of lands. The disabilities
under which a feudal owner very frequently lay gave rise to the
practice of conveying land by other methods than that of
feoffment with livery of seisin, that is, a handing over of the
feudal possession. That of “bargain and sale” was one. Where
a man bargained and sold his land to another for pecuniary
consideration, which might be merely nominal, and need not
necessarily be actually paid, equity held the bargainor to be
seised of the land to the use of the bargainee. The Statute of
Uses (1533), by converting the bargainee’s interest into a legal
estate, had an effect contrary to the intention of its framers. It
made bargain and sale an easy means of secret or private con-
veyance, a policy to which the law was opposed. To remedy
this defect, a statute (called the Statute of Enrolments) was
passed in the same year, which provided that every conveyance
by bargain and sale of freehold lands should be enrolled in a court
of record or with the custos rotulorum of the county within six
months of its date. The Statute of Enrolments applied only
to estates of inheritance or for life, so that a bargain and sale of
an estate for years might be made without enrolment. This in
turn opened another mode of another mode of conveyance, namely,
lease and release, which took the place of the deed of
bargain and sale, so far as regards freehold. Bargain and sale
of copyhold estates, which operates at common law, is still
a mode of conveyance in England in the case of a sale by executors,
where a testator has directed a sale of his estate to be made,
instead of devising it to trustees upon trust to sell.
See also CONVEYANCING.

BARGE (Med. Lat. barca, possibly connected with Lat. baris,
Gr. βαρκα, a boat used on the Nile), formerly a small sailing
vessel, but now generally a flat-bottomed boat used for carrying
goods on inland navigations. On canals barges are usually
towed, but are sometimes fitted with some kind of engine; the
men in charge of them are known as bargers. On tidal rivers
barges are often provided with masts and sails (“sailing barges”),
or in default of being towed, they drift with the current, guided
by a long oar or oars (“dumb-barges”). Barges used for un-
loading, or loading, the cargo in ships or harbours are sometimes
called “lighters” (from the verb “to light” = to relieve of a
load). A state barge was a heavy, often highly ornamented
vessel used for carrying passengers on occasions of state cere-
momies. In British folklore barges are supposed also to have
been used to carry the dead to the river for the use of members of the college rowing clubs. In
New England the word barge frequently means a vehicle, usually
covered, with seats down the side, used for picnic parties or the
conveyance of passengers to or from piers or railway stations.

BARGEBOARD (probably from Med. Lat. bargus, or barcus, a
scaffold, and not from the now obsolete synonym “vergeboard”),
the boards fastened to the projecting gables of a roof to give
strength to the same and to mask or hide the horizontal timbers
of the roof to which they were attached. Bargeboards are some-
times moulded only or carved, but as a rule the lower edges
were cusped and had tracery in the spandrels besides being
otherwise elaborated. The richest example is one at Ockwells
in Berkshire, England, which is moulded and carved as if it
were intended for internal work.

BARGEST, BARGUEST or BARGEST, the name given in the
north of England, especially in Yorkshire, to a monstrous goblin-
dog with huge teeth and claws. The spectre-hound under various
names is familiar in folk-lore. The Demon of Tedworth, the Black
Dog of Winchester and the Padfoot of Wakefield all shared the
classification of the Barghest of York. In Wales its counter-
part was Gwyllgi, “the Dog of Darkness,” a frightful apparition
of a mastiff with baleful breath and blazing red eyes. In Lanca-
shire the spectre-hound is called Trash or Striker. In Cambridg-
eshire and on the Norfolk coast it is known as Shuck or Shock.
In the Isle of Man it is styled Mauhe Dog. It is mentioned by
Sir Walter Scott in “The Lay of the Last Minstrel” —

For he was speechless, ghastly, wan
Like him of whom the story ran
Who spoke the spectre bound in Man.

A Welsh variant is the Cwnn Annwn, or “dogs of hell.” The
barghest was essentially a nocturnal spectre, and its appearance
was regarded as a portent of death. Its Welsh form is confined
to the sea-coast parishes, and on the Norfolk coast the creature
is supposed to be amphibious, coming out of the sea by night
and travelling about the lonely lanes. The derivation of the word
barghest is disputed. “Ghost” in the north of England is
pronounced “guest,” and the name is thought to be burk-ghost,
“town-ghost.” Others explain it as German Berg-geist, “moun-
tain demon,” or Bar-geist, “bear-demon,” in allusion to its
alleged appearance at times as a bear. The barghest has a
kinsman in the Roungeur d’Ois of Norman folklore. A belief
in the spectre-hound still lingers in the wild parts of the north
country of England, and in Nidderdale, Yorkshire, nurses frighten
children with its name.

See Wirt Sikes, British Goblins (1880); Notes and Queries, first
series, ii. 51; Joseph Ritson, Fairy Tales (Lond. 1811), p. 58;
Lancashire Folklore (1867); Joseph Lucas, Studies in Nidderdale
(Pateley Bridge, 1882).

BARHAM, RICHARD HARRIS (1788-1845), English
humourist, better known by his nom de plume of THOMAS
INGOGBY, was born at Canterbury on the 6th of December
1788. At seven years of age he lost his father, who left him a
small estate, part of which was the manor of Tappington, so
frequently mentioned in the Legends. At nine he was sent to
St Paul’s school, but his studies were interrupted by an accident
which shattered his arm and partially crippled it for life. Thus
depended on his own endeavours for the great activity and
readiness and diligence of student. In 1807 he entered Brasenose
College, Oxford, intending at first to study for the profession
of the law. Circumstances, however, induced him to change his
mind and to enter the church. In 1813 he was ordained
and took a country curacy; he married in the following year,
and in 1821 removed to London on obtaining the appointment
of minor canon of St Paul’s cathedral. Three years later he became
one of the priests in ordinary of the King’s Chapel Royal,
and was appointed to a city living. In 1826 he first contributed
to Blackwood’s Magazine; and on the establishment of Bentley’s
Miscellany in 1837 he began to furnish the series of grotesque
metrical tales known as The Ingoldsby Legends. These became
very popular, were published in a collected form and have
since passed through numerous editions. In variety and whimsical-
ness of rhymes these verses have hardly a rival since the days
of Hudibras. But beneath this obvious popular quality there lies
a wealth of genuine antiquarian learning, the fruit of patient studi-
ous research, in one-of-the-way old books which few readers
who laugh over his pages detect. His life was grave, dignified
and highly honoured. His sound judgment and his kind heart
made him the trusted counsellor, the valued friend and the
frequent peacemaker; and he was intolerant of all that was
mean and base and false. In politics he was a Tory of the old
school; yet he was the lifelong friend of the liberal Sydney
Smith, whom in many respects he singularly resembled. Theor-
dore Hook was one of his most intimate friends. Barham was a
contributor to the Edinburgh Review and the Literary Gazette;
he wrote articles for Gorton’s Biographical Dictionary; and
a novel, My Cousin Nicholas (1834). He retained vigour
and freshness of heart and mind to the last, and his last verses
(“As I laye a-thynkynge”) show no signs of decay. He
died in London after a long, painful illness, on the 17th of June
1845, and his short memoir, by his son, was prefixed to a new edition of
Ingoldsby in 1847, and a fuller Life and Letters, from the same hand,
was published in 2 vols. in 1870.

BAR HARBOR, a well-known summer resort of Hancock
county, Maine, U.S.A., an unincorporated village, in the town-
ship of Eden, on Frenchman’s Bay, on the E. side of Mount
Desert Island, about 45 m. S.E. of Bangor. Pop. of the township
(1900) 4370; (1910) 4441; of the village (1910), about 2000,
greatly increased during the summer season. Bar Harbor is
served by the Maine Central railway and by steamship lines
to New York, Boston, Portland and other ports. The summer
climate is cool, usually too cool for sea-bathing, but there is a
large open-air salt water swimming bath. Rugged mountains from 1000 to 1500 ft. in height, a coast with deep indentations and lined with bold cliffs, a sea dotted with rocky islands, clear lakes, sparkling rivulets, deep gorges, and wooded gorges are features of the attractive scenery here and in the vicinity. Several fine hotels and a number of costly residences occupy a plateau along the shore and the hillsides farther back. The Kebo Valley Club has fine golf links here; and since 1900 an annual horse show and fair has been held at Robin Hood Park at the foot of Newport Mountain. Bar Harbor is usually a summer rendezvous of the North Atlantic Squadron of the United States Navy. The name Bar Harbor, which displaced East Eden, was suggested by the bar which appears at low water between it and Bar Island. Although the first summer hotel was built here in 1855, Bar Harbor's development as a summer resort began about 1870, after some artists had visited the place, and made it widely known through their pictures. (See Mount Desert.)

BAR-HEBRAEUS of Abu'l-Fara, a marhian or catholicus of the Jacobite (Monophysite) Church in the 13th century, and (in Dr. Wright's words) "one of the most learned and versatile men that Syria ever produced." Perhaps no more industrious compiler of knowledge ever lived. Simple and uncrical in his modes of thought, his writings are devoid of any striking originality, but as embodied in his numerous and elaborate treatises on the results of such research in theology, philosophy, science and history as was in his time possible in Syria. Most of his works were written in Syriac, but some few in Arabic, which had long before his time supplanted Syriac as a living speech.

The son of a physician of Jewish descent, Bar-Hebraeus was born in 1226 at Malatia on the upper Euphrates. His youth was passed in the troublous times of the Mongol advance into western Asia, and his father eventually retired to Antioch, where Bar-Hebraeus completed his education. In 1246 he was ordained at Tripolis as Jacobite bishop of Gbûsûn near Malatia, and a year later was transferred to the neighbouring diocese of Lâkkabûn, whence in 1253 he passed to be bishop of Aleppo. Deposed almost immediately by an ecclesiastical superior on account of disputes about the patriarchate, he was restored to his see in 1258, and in 1264 was promoted by the patriarch Ignatius III. to be marhian—the next rank below that of patriarch—an office which he held till his death at Marâgha in 1286. He seems to have been a model of devotion to his ecclesiastical duties and to have won the respect of all parties by his sound ecclesiastical views and his piety. Bar-Hebraeus was a keen student. The church is one of the four Palatine churches of Apulia (the others being the cathedrals of Aquaviva and Altamura, and the church of Monte S. Angelo sul Gargano). Adjacent is the small church of S. Gregorio, belonging also to the 11th century. The castle, built in 1169, and strengthened in 1233, lies on the W. side of the old town: it is now used as a prison. The old harbour lies on the E. side of the peninsula, and the new on the W. In the new town is the Ateneo, containing the provincial museum, with a large collection of vases found in the district, in which the pre-Hellenic specimens are especially important (M. Mayer in Römische Mitteilungen, 1897, 201; 1899, 13; 1904, 188, 276). Barì is the seat of the command of the X. army corps, and the most important commercial town in Apulia. It manufactures olive oil, soap, carbon sulphide and playing-cards, and has a large iron foundry.

Barium does not seem to have been a place of great importance in early antiquity; only bronze coins struck by it have been found. In Roman times it was the point of junction between the coast road and the Via Traiana; there was also a branch road to Tarentum from Barium. Its harbour, mentioned as 183 B.C., was probably the principal one of the district in ancient times, as at present, and was the centre of a fishery. But its greatest importance dates from the time when it became, in 852, a seat of the Saracen power, and in 885, the residence of the Byzantine governor. In 1171 it was captured by Robert Guiscard. In 1093 Peter the Hermit preached the first crusade there. In 1156 it was razed to the ground, and has since suffered destruction. In the 14th century it became an

cosmography, edited and translated by F. Nau (Paris, 1890); (4) various medical works; (5) Khâbîhab d-he-Smîbû (Book of Raws), a treatise on grammar; (6) ethical works; (7) poems; (8) Khâbîhab d-he-Thurûnuûy Megebhabbûmû (Book of Entertaining Stories), edited and translated by E. A. W. Budge (London, 1897). (N. M.)

BAR, a tribe of Nilotic negroes, living on the banks of the upper Nile from 200 n. of Albert Nyanza. They have neighbours the Dinka to the north, the Madí to the south, and the Galla to the east. The men are tall and thin, the women fat and under middle height. Their colour is a deep dead brown. The men and unmarried girls go practically naked, the married women wearing a goatskin dyed red. The body is ornamented with red clay and the lower incisors are often extracted. Their sole wealth is cattle and their chief food milk and blood; meat is only eaten when a cow happens to die. They live in round grass huts with conical roofs. Twins are considered unlucky, the mother is divorced by her husband and her family must refund part of the marriage-price. The dead are buried in the hut; a square grave is dug in which the body is arranged in a sitting position with the hands tied behind the back. The most important men in the country are the rainmakers, who are revered even more than the chiefs, and, indeed, are famous among the surrounding tribes. The Bari warriors have been much recruited for the Egyptian army and were formerly used as slave-hunters by the Arab traders.

BARILI—BARISAL

401

independent duchy, and in 1558 was left by Bona Sforza to Philip II. of Spain and Naples.

BARILI, a town of the province of Cebu, island of Cebu, Philippine Islands, on the Barili river, 2 m. from its mouth and about 35 m. S.W. of Cebu, the capital. Pop. (1903) 31,617. It has a relatively cool and healthful climate. Its people are agriculturists and raise Indian corn, sibucao, hemp, cacao and coffee. The language is Cebu-Visiayan.

BARING, the name of a family of English financiers and bankers. The firm of Baring Brothers was founded by Francis Baring (1740-1810), whose father, John Baring, son of a Lutheran minister at Bremen, had come to England from Germany, and started a cloth manufactory at Larkbear, near Exeter. Francis Baring was born at Larkbear, and in due course was placed in a London commercial firm. In 1770, in conjunction with his brother John, Francis Baring established a banking-house in London, and before he died in 1810 had so developed the business that he was regarded as the first merchant in Europe. He was for many years a director of the East India Company, and chairman in 1792-1793, receiving a baronetcy for his services. From 1784-1806 he sat almost continuously in parliament as a Whig. He left the firm in the year that Thomas Baring (1779-1848) was a well-known art-patron and collector. The control of the business passed to his second son, Alexander (1774-1848), better known as Lord Ashburton, who had already been highly successful in extending the firm's operations in America, where his marriage with the daughter of William Bingham, a wealthy resident of Philadelphia and United States senator, secured him considerable influence with the American commercial community. From 1806-1835 he represented various constituencies in parliament where he strongly opposed reform. In 1834 he became president of the Board of Trade and master of the mint in Sir Robert Peel's first administration, and the following year was raised to the peerage as Baron Ashburn. His business capacity and intimate acquaintance with American customs and institutions caused his appointment in 1842 as commissioner to the United States to negotiate the settlement of the north-eastern boundary question and other matters in dispute between the two countries, and he concluded in that year at Washington the treaty, commonly known as the Ashburn treaty, which the frontier between Maine and Canada was fixed. After his death in 1848 the affairs of the house were managed by Thomas Baring (1790-1873), the son of Sir Thomas Baring. Thomas Baring represented Huntington in parliament from 1844 till his death. His elder brother, Sir Francis Thornhill Baring (1796-1866), sat for Portsmouth from 1826-1865. From 1839-1841 he was chancellor of the exchequer, and from 1840-1852 first lord of the admiralty. In 1866 he was created Baron Northbrook, the barony being converted in 1876 into an earldom in favour of his eldest son Thomas George Baring (1826-1904). The latter, the 1st Earl of Northbrook, was occupied almost entirely with public affairs, and filled at different times many important official positions. He is best remembered as viceroy of India, which office he held from 1872-1876, but his last public position was first lord of the admiralty (1880-1885). With the death of Thomas Baring, Edward Charles Baring (1828-1897), son of Henry Baring, M.P., and grandson of Sir Francis Baring, became head of the firm of Baring Brothers, and in 1885 was raised to the peerage as Baron Revelstoke. The house of Baring then stood at the height of its prosperity. During the following years a large amount of English capital was advanced to the Argentine Republic, Barings undertaking the loans and guaranteeing the interest. Through the continued default of the Argentine government, Barings became seriously involved, their heavy obligations precipitating a general financial crisis. Towards the end of 1890 it became known that the firm was on the eve of suspending payment, with liabilities amounting to £21,000,000. The prompt action of the Bank of England, which in conjunction with the leading joint-stock banks of the United Kingdom took over these liabilities, averted further disaster, and the firm of Baring Brothers was subsequently reorganized as a limited company with a capital of £1,000,000.

Besides those already referred to, various other members of the Baring family have achieved public distinction, notably Charles Baring (1807-1870), bishop of Durham, and Evelyn Baring, 1st Earl of Cromer (q.v.).

BARING-GOULD, SABINE (1834- ), English novelist, was born at Exeter on the 28th of January 1834. After graduating at Clare College, Cambridge, he spent some years in travel, and became in 1864 curate of Horbury, Yorkshire; then perpetual curate of Dalton, in the same county, in 1867; and in 1871 rector of East Merssea, Essex. On his father's death in 1872 he inherited the estate of Lew Trenchard, North Devon, where his family had been settled for nearly three centuries, and he exchanged his Essex living for the rectory of Lew Trenchard in 1881. He had a ready pen, and began publishing books on one subject or another-fiction, travel, history, folklore, religion, mythology, from 1854 onwards. His novel Mekolah (1880), the scene of which is laid on the east coast of England, was an excellent story, and among many others may be mentioned John Herrig (1883), a tale of the west country; Court Royal (1886); Red Spider (1887); The Pennycomquicks (1889); Cheap Jack Zita (1893); and Broom Squire (1896), a Sussex tale. His contributions to the study of geography, antiquities and folklore, while popularly written, were also full of serious research and real learning. His book of Wore-wolves (1865), Curious Myths of the Middle Ages (1866), Curious Survivals (1892). He produced at the same time many volumes of sermons and popular theology, and edited (1871-1873) The Sacristy, a quarterly review of ecclesiastical art and literature.

Living the life of the rapidly disappearing English "squarson," and full of cultivated interests, especially in humanizing the local village mind, and investigating and recording the good things of old-time, his many-sided activities were shown in every direction and his literary facility made his work known far and wide. His familiarity with the country-side and his interest in folklore were of special utility in recovering and preserving for publication a large mass of English popular song, and in assisting the new English movement for studying and appreciating the old national ballad-music.

BARINGO, a lake of British East Africa, some 30 m. N. of the equator in the eastern rift-valley. It is one of a chain of lakes which stretch the floor of the valley and have an elevation of 3325 ft. above the sea. It is about 16 m. long by 9 broad and has an irregular outline, the northern shore being deeply indented. Its waters are brackish. Fed by several small streams it has no outlet. The largest of the rivers which enter it, the Tigrish and the Nyuki, run north through a flat marshy country which extends south of the lake. This district, inhabited by the negro tribe of Njamusi, was by the first explorers called Njemps. It is a fertile grain-growing region containing two considerable villages. The Njamusi are peaceful agriculturists who show marked friendliness to Europeans. N. of the lake rise the Karosi hills; to the E. the land rises in terraces to the edge of the Lake Lilliput escarpment. A characteristic of the country in the neighbourhood of the lake are the "hills" or the termite (white ants). They are hollow columns 10 to 12 ft. high and from 1 to 2 in. broad. The greater kudu, almost unknown elsewhere in East Africa, inhabits the flanks of the Lake Lilliput escarpment to the east of the lake and comes to the foot-hills around Baringo to feed. The shores of Lake Baringo were first reported in Europe by Ludwig Krafi and J. Rehmam, German missionaries stationed at Mombasa, about 1850; in J. H. Speke's map of the Nile sources (1863) Baringo is confused with Kavirono Gulf of Victoria Nyanza; it figures in Sir H. M. Stanley's map (1877) as a large sheet of water N.E. of Victoria Nyanza. Joseph Thomson, in his journey through the Masai country in 1883, was the first white man to see the lake and to correct the exaggerated notions as to its size. Native tradition, however, asserts that the lake formerly covered a much larger area.

BARISAL, a town of British India, headquarters of Barisalg district in Eastern Bengal and Assam, situated on a river of the same name. Pop. (1901) 18,978. It is an important centre of river trade, on the steam route through the Sundarbans.
from Calcutta to the Brahmaputra. It contains a first grade college and several schools. There are a public library, established by subscription in 1855, and a students' union, for helping the sick and poor and promoting the intellectual and physical improvement of boys. Barisal has given its name to a curious physical phenomenon known as the “Barisal guns,” the cause of which has not been satisfactorily explained. These are noises, like the report of cannon, frequently heard in the channels of the delta of the Brahmaputra, at the rising of the tide.

**BARIUM** (symbol Ba, atomic weight 137.37 [O = 16]), one of the metallic chemical elements included in the group of the alkaline earths. It takes its name from the Greek barys (heavy) on account of its presence in barytes or heavy spar which was first investigated in 1602 by V. Cascioriuolus, a shoemaker of Bologna, who found that after ignition with combustible substances it became phosphorescent, and on this account it was frequently called Bolognian phosphorus.

In 1774 K. W. Scheele, in examining a specimen of pyrolusite, found a new substance to be present in the mineral, for on treatment with sulphuric acid it gave an insoluble salt which was afterwards shown to be identical with that contained in heavy spar. Barium occurs chiefly in the form of barytes or heavy spar, BaSO₄, and witherite, BaCO₃, and to a less extent in baryto-calcite, baryto-telestine, and various complex silicates. The metal is difficult to obtain, and until recently it may have been obtained in small quantity.

Sir H. Davy tried to electrolyse barium but was unsuccessful; later attempts were made by him using barium chloride in the presence of mercury. In this way he obtained an amalgam, from which on distilling off the mercury the barium was obtained as a silver white residue. R. Bunsen in 1854 electrolysed a thick paste of barium chloride and dilute hydrochloric acid in the presence of mercury, at 100°C, obtaining a barium amalgam, from which the mercury was separated by a process of distillation.

A. N. Guntz (*Comptes rendus*, 1901, 133, p. 872) electrolyses a saturated solution of barium chloride using a mercury cathode and obtains a 7% barium amalgam; this amalgam is transferred to an iron boat in a wide porcelain tube and the tube slowly heated electrically, a good yield of pure barium being obtained at about 1000°C. The metal when freshly cut possesses a white luster, is a little harder than lead, and is extremely easily oxidized on exposure; it is soluble in liquid ammonia, and readily attacks both water and alcohol.

Three oxides of barium are known, namely, the monoxide, BaO, the dixoide, Ba₂O₃, and the trioxide, BaO₂, with sodium in a vacuum tube at 1000°C (Guntz, loc. cit., 1906, p. 339). The monoxide is formed when the metal burns in air, but is usually prepared by the ignition of the nitrate, oxygen and oxides of nitrogen being liberated. It can also be obtained by the ignition of an intimate mixture of the carbonate and carbon, and in small quantities by the ignition of the iodate. It is a greyish coloured solid, which combines very energetically with water to form the hydroxide, much heat being evolved during the combination; on heating to redness in a current of oxygen it combines with the oxygen to form the dioxide, which at higher temperatures breaks up again into the monoxide and oxygen.

Barium hydroxide, Ba(OH)₂, is a white powder that can be obtained by slaking the monoxide with the requisite quantity of water, but it is usually made on the large scale by heating heavy spar with small coal whereby a crude barium sulphide is obtained. This sulphide is then heated in a current of moist carbon dioxide, barium carbonate being formed, BaSO₄ + CO₂ = BaCO₃ + H₂S, and finally the carbonate is decomposed by a current of superheated steam, BaCO₃ + H₂O = Ba(OH)₂ + CO₂, leaving a residue of the hydroxide. It is a white powder, moderately soluble in cold water, readily soluble in hot water, the solution possessing an alkali reaction and absorbing carbon dioxide readily. The solution, known as *baryta-water,* finds an extensive application in practical chemistry, being used in gas-analysis for the determination of the amount of carbon dioxide in the atmosphere; and also being used in organic chemistry as a hydrolysing agent for the decomposition of complex ureides and substituted aceto-acetic esters, while, E. Fischer has used it as a condensing agent in the preparation of α- and β-acetoacetic from acrocin dibromide. A saturated solution of the hydroxide deposits on cooling a hydrated form Ba(OH)₂·8H₂O, as colourless quadrilateral prisms, which on exposure to air lose seven molecules of water of crystallization.

Barium dioxide, BaO₂, can be prepared as shown above, or in the hydrated condition by the addition of excess of baryta-water to hydrogen peroxide solution, when it is precipitated in the crystalline condition as BaO₂·2H₂O. These crystals on heating to 130°C lose the water of crystallization and leave a residue of the anhydrous peroxide. In the Brin process for the manufacture of oxygen, barium dioxide is obtained as an intermediate product by heating barium monoxide with air under pressure. It is a grey powdered powder which is readily decomposed by dilute acids with the production of hydrogen peroxide.

Barium chloride, BaCl₂·2H₂O, can be obtained by dissolving wositer in dilute hydrochloric acid, and also from heavy spar by ignition in a reverberatory furnace with a mixture of coal, limestone and calcium chloride, the barium chloride being extracted from the fused mass by water, leaving a residue of insoluble calcium sulphide. The chloride crystallizes from a colourless rhombohedral crystals of specific gravity 3.0 and is readily soluble in water, but is almost insoluble in concentrated hydrochloric acid and in absolute alcohol. It can be obtained in the anhydrous condition by heating gently to about 120°C. It has a bitter taste and is a strong poison.

Barium bromide is prepared by saturating baryta-water or by decomposing barium carbonate with hydrobromic acid. It crystallizes as BaBr₂·2H₂O isomorphous with barium chloride. Barium bromate, Ba(BrO₃)₂, can be prepared by the action of excess of bromine on baryta-water, or by decomposing a boiling aqueous solution of 100 parts of potassium bromate with a similar solution of 74 parts of crystallized barium chloride. It crystallizes in the monoclinic system, and separates from its aqueous solution as Ba(BrO₃)₂·H₂O. On heating, it begins to decompose at 260-265°C. Barium carbonate, BaCO₃·H₂O, is obtained by adding barium chloride to sodium carbonate solution; on concentration of the solution sodium chloride separates first, and then on further evaporation barium carbonate crystallizes out and can be purified by recrystallization. It can also be obtained by suspending barium carbonate in boiling water and passing in chlorine gas. It crystallizes in the monoclinic system as BaCO₃·H₂O·4H₂O and begins to decompose on being heated to 250°C. Barium iodate, Ba(IO₃)₂, is obtained by the action of excess of iodic acid on hot caustic baryta solution or by adding sodium iodate to barium chloride solution. It crystallizes in monoclinic prisms of composition Ba(IO₃)₂·H₂O, and is only very sparingly soluble in cold water.

Barium carbide, BaC₃, is prepared by a method similar to that in use for the preparation of calcium carbide (see *Acetylene*). L. Maquenne has also obtained it by distilling a mixture of barium amalgam and carbon in a stream of hydrogen. Barium sulphide, BaS, is obtained by passing sulphurated hydrogen over heated barium monoxide, or better by fusion of the sulphate with a small coal. It is a white powder which is readily decomposed by water with the formation of the hydroxide and hydrosulphide. The phosphorescence of the sulphide obtained by heating the thiosulphate is much increased by adding uranium, bismuth, or thorium before ignition (*J. pr. Chem.*, 1905, ii. p. 106).

Barium sulphate, BaSO₄, is the most abundant of the naturally occurring barium compounds (see *Barites*) and can be obtained artificially by the decomposition of sulphated acid or any soluble compound of barium and sulphuric acid to a solution of a soluble barium salt, when it is precipitated as an amorphous white powder of specific gravity 4.5. It is practically insoluble in water, and is only very slightly soluble in dilute acids; it is soluble to some extent, when freshly prepared, in hot concentrated sulphuric acid, and on cooling the solution, crystals of composition BaSO₄·3H₂O are deposited. It is used as a pigment under the name of “permanent white” or *blanc fixe.*

Barium nitride, Ba₃N₂, is obtained as a brownish mass by
passing nitrogen over heated barium amalgam. It is decomposed by water with evolution of hydrogen, and on heating in a current of carbonic oxide forms barium cyanide (L. Maquenne). Barium amide, Ba(NH<sub>2</sub>), is obtained from potassassium and barium bromide.

Barium nitrate, Ba(NO<sub>3</sub>), is prepared by dissolving either the carbonate or sulphide in dilute nitric acid, or by mixing hot saturated solutions of barium chloride and sodium nitrate. It crystallizes in octahedra, having a specific gravity of 3.2, and melts at 597° C. (T. Carnelley). It is decomposed by heat, and is largely used in pyrotechny for the preparation of green fire. Barium carbonate, BaCO<sub>3</sub>, occurs rather widely distributed as wisterite (q.v.), and may be prepared by the addition of barium chloride to a hot solution of ammonium carbonate, when it is precipitated as a dense white powder of specific gravity 4.3, almost insoluble in water.

Barium and its salts can be readily detected by the yellowish-green colour they give when moistened with hydrochloric acid and heated in the Bunsenflame, or by observation of their spectra, when certain characteristic green lines are seen. In solution, barium salts may be detected by the immediate precipitate they give on the addition of calcium sulphate (this serves to distinguish barium salts from calcium salts), and by the yellow precipitate of barium carbonate formed on the addition of potassium chromate. Barium is estimated quantitatively by conversion into the sulphate. The atomic weight of the element has been determined by C. Margnac by the conversion of barium chloride into barium sulphate, and also by a determination of the amount of silver required to precipitate exactly a known weight of the chloride; the mean value obtained being 136.84: T. W. Richards (Zeit. anorg. Chem., 1893, 6, p. 89), by determining the equivalent of barium chloride and bromide to silver, obtained the value 137.44.

For the relation of barium to radium, see Radioactivity.

**BARKER, EDMUND HENRY** (1788–1839), English classical scholar, was born at Holmly in Yorkshire. He entered Trinity College, Cambridge, as a scholar in 1807, but left the university without a degree, being prevented by religious scruples from taking the oath then required. He had previously obtained (in 1809) the Browne medal for Greek and Latin epigrams. After acting as amanuensis to the famous Samuel Parr, the vicar of Hatton in Warwickshire, he married and settled down at Thetford in Norfolk, where he lived for about five years, and was in the habit of adding the initials O.T.N. (of Thetford, Norfolk) to the end of many of his published works. In later life he became involved in a law-suit in connexion with a will, and thus exhausted his means. In 1837–38 he was a prisoner for debt in the king's bench and in the Fleet. He died in London on the 21st of March 1839. Barker was a prolific writer on classical and other subjects. In addition to contributing to the Classical Journal, he edited portions of several classical authors for the use of schools. He was one of the first commentators to write notes in English instead of Latin. In a volume of letters he disputed the claims of Sir Philip Francis to the authorship of the Letters of Junius; his Parriana (1828) is a vast and ill-digested compilation of literary anecdotes and criticisms. He also saw through the press the English edition of Lemprêtre's Classical Dictionary (revised by Anthon) and of Webster's English Dictionary. It is as a lexicographer, however, that Barker is chiefly known. While at Hatton, he conceived the design of a new edition of Stephanus's Thesaurus Graecae Linguae. The work was undertaken by A. J. Valpy, and, although not expressly stated, it was understood that Barker was the responsible editor. When a few parts had appeared, it was severely criticized in the Quarterly Review (xxii., 1820) by Blomfield; the result was the curtailing of the original plan of the work and the omission of Barker's name in connexion with it. It was completed in twelve volumes (1816–1828). The strictures of the Quarterly were answered by Barker in his Aristarchus Anti-Blomfeldianus, which, although unconvincing, was in turn answered by Bishop Monk. He also published notes on the Byzantinum Gudianum, and collaborated with Professor Dunbar of Edinburgh in a Greek and English Lexicon (1831). The edio princeps (1820) of the treatise attributed to Arcadius, Epist. 94, was published by him from a Paris MS. Continental scholars entertained a more favourable opinion of him than those of his own country. He expressed contempt for the minute verbal criticism of the Porsonian school, in which he was himself deficient.

An account of his life will be found in the Gentleman's Magazine for May 1839; see also Notes and Queries (6th series, ii. p. 443), where a full list of his works is given.

**BARKER'S MILL**, a mechanical contrivance invented by Dr Barker about the end of the 17th century. It consisted of a hollow vertical cylinder, provided with a number of horizontal arms fitted with lateral apertures; the contrivance is mounted so as to rotate about the vertical axis. By allowing water to enter the vertical tube, a rotation, due to the discharge through the lateral orifices, is set up.

**BARKING**, a market-town in the Romford parliamentary division of Essex, England, on the river Roding near its junction with the Thames, 8 m. E. of Fenchurch Street station and 14 m. N. of London, Tilbury & Southend and Great Eastern railways. Pop. of urban district of Barking town (1891) 14,309; (1901) 21,547. The church of St Margaret is Norman with perpendicular additions, and contains many monuments of interest. Barking was celebrated for its nunnery, one of the oldest and richest in England, founded about 670 by Erkenwald, bishop of London, and restored in 970 by King Edgar, about a hundred years after its destruction by the Danes. The abbess was a baroness ex officio, and the revenue at the dissolution of the monasteries was £1084. There remains a perpendicular turret gateway. There is also an ancient market-house, used as a town-hall. Victoria Gardens form a public pleasure-ground, and there are recreation grounds. The Gaslight and Coke Company's works at Beckton are in the parish, and also extensive rubber works. At the mouth of the Roding (Barking Creek) are great sewage works, receiving the Northern Outfall sewer from London. There are also chemical works, and some shipping trade, principally in timber and fish. Barking is a suffragan bishopric in the diocese of St Albans.

**BARKLY EAST**, a town of Cape province, South Africa, capital of a district of the same name, and 80 m. by rail E.S.E. of Allob North. The town lies north of the Drakensberg on the Kraai tributary of the Orange river at an elevation of 5831 ft. The district has an area of 1564 sq. m. and a population (1904) of 4900, of whom 50% are whites. The chief occupation followed is sheep-farming, the pasturage being excellent. Like Barkly West, the town and district are named after Sir Henry Barkly, governor of Cape Colony, 1870–1877.

**BARKLY WEST**, a town of Cape province, South Africa, 21 m. N.W. of Kimberley, capital of a district and of an electoral division of the same name in Griqualand West. It is built on the right bank of the Vaal, here spanned by a bridge. Pop. (1904) 1037. Originally called Klipdrift, the town was the first founded by the diggers after the discovery in 1867 of diamonds along the valley of the Vaal, and it had for some years a large floating population. On the discovery of the "dry diggings" at Kimberley, the majority of the diggers removed thither. Barkly West remains, however, the centre of the alluvial diamond industry. The diamonds of this district are noted for their purity and lustre, and are generally associated with other crystals—garnets, agates, quartz and chalcedonies.

Barkly West electoral division includes the whole of Griqualand West save the Kimberley division. It is divided into the fascial districts of Barkly West, Hay and Herbert, with a total pop. (1904) of 48,385, of whom 12,170 are whites (see GRIQUALAND).
BAR-LE-DUC

held high office at the court of the caliph Abū Ja‘far al-Mansūr, as his father Sergius is said to have done before him.

The outline of the Greek story is as follows:—St. Thomas had converted the people of India, and after the eremitic life originated in Egypt, many Indians adopted it. But a powerful pagan king arose who hated and persecuted the Christians, especially the ascetics. After this king, Abener by name, had long been childless, a boy greatly desired and matched in beauty, was born to him and received the name of Josaphat. The king, in his joy, summons astrologers to predict the child’s destiny. They foretell glory and prosperity beyond those of all his predecessors. One sage, most learned of all, asserts, but intimates that the scene of this glory will be, not the paternal kingdom, but another infinitely more exalted, and that the child will adopt the faith which his father persecutes.

The boy shows a thoughtful and devout turn. King Abener, troubled by this and by the remembrance of the prediction, selects a secluded city, in which he causes a splendid palace to be built, where his son should abide, attended only by tutors and servants in the flower of youth and health. No stranger was to have access, and the boy was to be cognizant of none of the sorrows of humanity, such as poverty, disease, old age or death, but only of what was pleasant, so that he should have no inducement to think of the future life; nor was he ever to hear a word of Christ and His religious teachings.

Prince Josaphat grows up in this seclusion, acquires all kinds of knowledge and exhibits singular endowments. At length, on his urgent prayer, the king reluctantly permits him to pass the limits of the palace, after having taken all precautions to keep painful objects out of sight. But through some neglect of orders, the prince one day encounters a leper and a blind man, and asks of his attendants with pain and astonishment what such a spectacle should mean. These, they tell him, are ills to which man is liable. Shall all men have such ills? he asks. And in the end he returns home in deep depression. Another day he falls in with a decrepit old man, and stricken with dismay at the sight, receives his questions and hears for the first time of death. And in how many years, continues the prince, does this fate befall man? and must he expect death as inevitable? Is there no way of escape? No means of eschewing this wretched state of decay? The attendants reply as may be imagined; and Josaphat goes home more pensive than ever, dwelling on the certainty of death and on what shall be thereafter.

At this time Barlaam, an eremite of great sanctity and knowledge, is wandering the wilderness of Sennaritis, divinely warned, travels to India in the disguise of a merchant, and gains access to Prince Josaphat, to whom he imparts the Christian doctrine andcommends the monastic life. Suspicion arises and Barlaam departs. But all attempts to shake the prince’s convictions fail. As a last resource the king sends for Theudas, a magician, who removes the prince’s attendants and substitutes seductive girls; but all their blandishments are resisted through prayer. The king abandons these efforts and associates his son in the government. The prince uses his power to promote religion, and everything prospers in his hands. At last Abener himself yields to the faith, and after some years of penitence dies. Josaphat surrenders the kingdom to a friend called Barachias and departs for the wilderness. After two years of painful search and much buffeting by demons he finds Barlaam. The latter dies, and Josaphat survives as a hermit many years. King Barachias afterwards arrives, and transfers the bodies of the two saints to India, where they are the source of many miracles.

Now this story is, mutatis mutandis, the story of Buddha. It will suffice to recall the Buddha’s education in a secluded palace, his encounter successively with a decrepit old man, with a man stricken with disease and poverty, with a dead body, and, lastly, with a religious recluse radiant with peace and dignity, and his consequent abandonment of his princely state for the ascetic life in the jungle. Some of the correspondences in the two stories are most minute, and even the phraseology, in which some of the details of Josaphat’s history are described, almost literally renders the Sanskrit of the Lālita Vistara. More than that, the very word Josaphat or Josaphat (Arabic, Yūdasaf) is a corruption of Bodisatva due to a confusion between the Arabic letters for V and B, and Bodisatva is a common title for the Buddha in many birth-stories that clustered round the life of the sage. There are good reasons for thinking that the Christian story did not originate with John of Damascus, and a strong case has been made out by Zotenberg that it reflects the religious struggles and disputes of the early 7th century in Syria, and that the Greek text was edited by a monk of Saint Saba named John, his version being the source of all later texts and translations. How much older than this the Christian story is, we cannot tell, but it is interesting to remember that it embodies in the form of a speech the “Apologet” of the 2nd-century philosopher Aristides. After its appearance among the writings of John of Damascus, it was incorporated with Simeon Metaphrastes’ Lives of the Saints (c. 950), and thence gained great vogue, being translated into almost every European language. A famous Icelandic version was made for Prince Hakon early in the 13th century. In the East, too, it took on new life and Catholic missionaries freely used it in their propaganda. Thus a Tagala (Philippine) translation was brought out at Manila in 1712. Besides furnishing the early playwrights with material for miracle plays, it has supplied episodio and apologies to many a writer, including Boccaccio, Beaumont and Shakespeare. Rudolph of Ems about 1380 expanded it into a long poem of 16,000 lines, celebrating the victory of Christian over heathen teaching. The heroes of the romance have even attained saintly rank. Their names were inserted by Petrus de Natalibus in his Catalogus Sanctorum (c. 1380), and Cardinal Baronius included them in the official Martyrology authorized by Sixtus V. (1585–1590) under the date of the 27th of November. In the Orthodox Eastern Church the “holy Joseph, son of Abener, king of India” is allotted the 26th of August. Thus unwittingly Gautama the Buddha has come to official recognition as a saint in two great branches of the Catholic Church, and no one will say that he does not deserve the honour. A church dedicated Divo Josaphat in Palermo is probably not the only one of its kind.

The identity of the stories of Buddha and St Josaphat was recognized by the historian of Portuguese India, Díogo do Couto (1542–1616), as may be seen in his history (Dec. 3, v. liv. cap. 2). In modern times the honour belongs to Laboulaye (1859), Felix Liebrecht in 1860 putting it beyond dispute. Subsequent researches have been carried out by Zotenberg, Max Müller, Rhys Davids, Davidstz and Joseph Jacobs, who published his Barlaam and Josaphat in 1896.

BAR-LE-DUC, a town of north-eastern France, capital of the department of Meuse, 50 m. E.S.E. of Châlons-sur-Marne, on the main line of the Eastern railway between that town and Nancy. Pop. (1906) 14,624. The lower, more modern and busier part of the town extends along a narrow valley, shut in by wooded or vine-clad hills, and is traversed throughout its length by the Ornain, which is crossed by several bridges. It is limited towards the north-east by the canal from the Marne to the Rhine, on the south-west by a small arm of the Ornain, called the Canal des Usines, on the left bank of which the upper town (Ville Haute) is situated. The Ville Haute, which is reached by staircases and steep narrow thoroughfares, is intersected by a long, quiet street, bordered by houses of the 17th, 16th and 17th centuries. In this quarter are the remains (16th century) of the château of the dukes of Bar, dismantled in 1670, the old clock-tower and the college, built in the latter half of the 16th century. Its church of St Pierre (14th and 15th centuries) contains a skillfully-carved effigy in white stone of a half-decayed corpse, the work of Ligier Richier (1500–1572), a pupil of Michelangelo—erected to the memory of René de Châlons (d. 1544). The lower town contains the official buildings and two or three churches, but these are of little interest. Among the principal sights of the town is one to Charles Nicolas Oudinot, whose house serves as the hôtel-de-ville. Bar-le-Duc has tribunals of first instance and of commerce, a board of trade arbitrators, a lycée, a training-college for girls, a chamber of commerce, a branch of the Bank of France and an art museum. The industries of the town include iron-founding and the manufacture of machinery, corsets, hosery,
flannel goods, jam and wall-paper, and brewing, cotton spinning and weaving, leather-dressing and dying. Wine, timber and iron are important articles of commerce.

Bar-le-Duc was at one time the seat of the countship, later duchy, of Bar, the history of which is given below. Though probably of ancient origin, the town was unimportant till the 10th century when it became the residence of the counts.

Counts and Dukes of Bar. In the middle of the 11th century the territory of Bar (Barrois) formed a dependency of the Empire. In the 11th century its lords were only counts by title; they belonged to the house of Mousson (which also possessed the countships of Montbéliard and Ferrette), and usually fought in the French ranks, while their neighbours, the dukes of Lorraine, adhered to the German side. Theobald I., count of Bar, was an ally of Philip Augustus, as was also his son Henry II., who distinguished himself at the battle of Bourvines in 1214. But sometimes the counts of Bar bore arms against France. In 1301 Henry III. having made an alliance with Edward I. of England, whose daughter he had married, was vanquished by Philip the Fair, who forced him to do homage for a part of Barrois, situated west of the Meuse, which was called Barrois mouvain. In 1354 Robert, count of Bar, who had married the daughter of King John, was made marquis of Pont-à-Mousson by the emperor Charles IV. and later, in the battle of Courtrai he was killed at Agincourt in 1415. In 1410 Louis of Bar, brother of the last-named, a cardinal and bishop of Châlons, gave the duchy of Bar to René of Anjou, the grandson of his sister Yolande, who married Isabella, Duchess of Lorraine. Yolande of Anjou, who in 1444 had married Ferri of Lorraine, count of Vaudémont, became heiress of Nicholas of Anjou, duke of Calabria and of Lorraine, in 1473, and of René of Anjou, duke of Bar, in 1480; thus Lorraine, with Barrois added to it, once more returned to the family of its ancient dukes. United with Lorraine to France in 1634, Barrois remained, except for short intervals, part of the royal domain. It was granted in 1738 to Stanislaus Leszczyński, ex-king of Poland, and on his death in 1766 was once more attached to the crown of France. (M.P.*

BARLETTA—BARLEY

BARLETTA (anc. Barduli), a seaport town and episcopal see of Apulia, Italy, on the E.S.E. coast, in the province of Bari, 343 m. W.N.W. of Bari by rail. Pop. (1901) 42,022. Its importance dates from the time of the Hohenstaufen. The Gothic church of S. Sepolcro was built at the close of the 12th century, and the Romanesque cathedral was begun at the same period, but the building was not completed till the time of Frederick II. Edward III., was killed at Agincourt in 1415. In 1410 Louis of Bar, brother of the last-named, a cardinal and bishop of Châlons, gave the duchy of Bar to René of Anjou, the grandson of his sister Yolande, who married Isabella, Duchess of Lorraine. Yolande of Anjou, who in 1444 had married Ferri of Lorraine, count of Vaudémont, became heiress of Nicholas of Anjou, duke of Calabria and of Lorraine, in 1473, and of René of Anjou, duke of Bar, in 1480; thus Lorraine, with Barrois added to it, once more returned to the family of its ancient dukes. United with Lorraine to France in 1634, Barrois remained, except for short intervals, part of the royal domain. It was granted in 1738 to Stanislaus Leszczyński, ex-king of Poland, and on his death in 1766 was once more attached to the crown of France. (M.P.*

BARLEY (Hordeum sativum), a member of the grass family, and an important cereal which belongs peculiarly to temperate regions. It originated from a wild species, H. spontaneum, a native of western Asia and has been cultivated from the earliest times.

There are two main varieties, (a) H. sativum, subsp. distichon (described by Linnaeus as a distinct species, H. distichon, with erect ears about 2 in. long, broad at the base and narrow at the tip, suggesting an open fan or petalock's tassel) and (b) H. distichon (var. erectum) with erect broad ears and closely-packed plump grains; (c) nodding barleys (var. mutans). The ripe ears of the last hang so as to become almost parallel with the stem; they are narrower and longer than in (b), owing to the grains being placed farther apart on the rachis; it includes the Chevalier variety, one of the best for malting purposes. (ii.) H. sativum, subsp. vulgare, bere, bigg or four-rowed barley (the H. vulgare of Linnaeus). All the flowers of each spikelet on both sides of the rachis are fertile and produce ripe fruits; hence the ear produces six longitudinal rows of grain. The ears are short, erect, and the grain thin and coarse; the straw is also short. It is a hardy race, but owing to the poor quality of the grain is rarely met with in Great Britain. (iii.) H. vulgare, subsp. distichon, large six-rowed barley (the H. distichon of Linnaeus). All the flowers of each spikelet are fertile as in (ii.), but the rows are not arranged regularly at equal distances round the rachis. The central fruits of each spikelet form two regular rows, but the lateral spikelets form not four straight single rows as in (ii.), but two regular opposite rows, the whole ear appearing irregularly four-rowed. This distinction is due to the rachis being attached to the ear of the variety than to the others. The ears are erect, about 2 in. long, the grains thinner and longer than in the two-rowed race, and the awns stiff and firmly adhering to the flowering glume. The var. vulgare is the barley most frequently cultivated in northern Europe and northern Asia. This race was formerly used for malt and beer, but owing to its larger amount of gluten as compared with starch it is less adapted for brewing than the two-rowed sorts.

To this belong the varieties naked barley (H. coeleste and H. nudum) and Himalayan barley (H. trifurcatum and H. aegiceras). In both the fruits fall out freely from the glume, and in the latter the awns are three-pronged and shorter than the grain.

Barley is the most hardy of all cereal grains, its limit of cultivation extending farther north than any other; and, at the same time, it can be profitably cultivated in sub-tropical countries. The opinion of Flintsly, that it is the most ancient aliment of mankind, appears to be well-founded, for no less than three varieties have been found in the lake dwellings of Switzerland, and deposits belonging to the Stone Period. According to Professor Heer these varieties are the two-rowed (H. distichum), the large six-rowed (H. hexastichum, var. denstum) and the small six-rowed (H. hexastichum, var. sanctum). The last variety is both the most ancient and the most commonly found, and is the sacred barley of antiquity, ears of which are frequently represented plated in the hair of the goddess Ceres, besides being figured on ancient coins.

The cultivation of barley in ancient Egypt is indicated in Exod. ix. 31. Till within recent times barley formed an important source of food in northern countries, and barley cakes are still to some extent eaten. Owing, however, to its poverty in that form of nitrogenous compound called gluten, so abundant in wheat, barley-flour cannot be baked into vesicated bread; still it is a highly-nutritious substance, the salts it contains having a high proportion of phosphoric acid. The following is the composition of barley-meal according to Von Bibra, omitting the salts:

Barley is now chiefly cultivated for malting (see Malting) to prepare spirits and beer (see Brewing), but it is also largely employed in domestic cookery. For the latter purpose the hard, somewhat flinty grains are preferable, and they are prepared by grinding off the outer cuticle which forms "pot barley." When the attrition is carried further, so that the grain is reduced to small round pellets, it is termed "pearl barley." Patent barley is either pot or pearl barley reduced to flour. Under the name decoctum hordei, a preparation of barley is included in the
British Pharmacopoeia, which is of value as a demulcent and emollient drink in febrile and inflammatory disorders.

Cultivation.—Apart from the growth-habits of the plant itself, the consideration that chiefly determines the routine of barley cultivation is the demand on the part of the maltster for uniformity of sample. Less care is required in its cultivation when it is intended for feeding live-stock. It is essential that the grains on the maltster's floor should germinate simultaneously, hence at the time of reaping, the whole crop must be as nearly as possible in the same stage of maturity. On rich soils the crop is liable to grow too rapidly and yield a coarse, uneven sample, consequently the best barley is grown on light, open and preferably calcareous soils, while if the condition of the soil is too high it is often reduced by growing wheat before the barley.

Barley (see Agriculture, Crops and Cropping) is a rapidly-growing and shallow-rooted plant. The upper layer of the soil must therefore be free from weeds, finely pulverized and stocked with a readily-available supply of nutrient. In most rotations barley is grown after turnips, or some other "cleaning" crop, with or without the interposition of a wheat crop. The roots are fed off by sheep during autumn and early winter, after which the ground is ploughed to a depth of 3 or 4 in. only in order not to put the layer of soil fertilized by the sheep beyond reach of the plough. It is not, therefore, as in most other cereals, the crumbling influence of frost till towards the end of winter, when it is stirred with the cultivator followed by the harrows, or in some cases ploughed with a shallow furrow. The seed, which should be plump, light in colour, with a thin skin covered by fine wrinkles, is sown in March and early April\(^1\) at the rate of from 8 to 12 pecks to the acre and lightly harrowed in. As even distribution at a uniform depth is necessary, the drill is preferred to the broadcast-seeder for barley sowing. In early districts seeding may take place as early as February, provided a fine tilth is obtainable, but it rarely extends beyond the end of April.

If artificial manures are used, a usual dressing consists of 2 or 3 cwt. of superphosphate to the acre at the time of sowing, followed, if the ground is in poor condition, by 1 cwt. of nitrate of soda when the plant is showing. Nitrogen must, however, be applied with caution as it makes the barley rich in albumen, and highly albuminous barley keeps badly and easily loses its germinating capacity. Farm-yard manure should also be avoided. After-cultivation may comprise rolling, harrowing (to preserve the fineness of the tilth) and in some districts hoeing, which is usually followed by scythe or machine, a good crop with the ears bending under the weight of the crop. The crop is often allowed to lie loose for a day or two, owing to the belief that sunshine and dews or even showers mellow it and improve its colour. It may even be stacked without tying into sheaves, though this course involves greater expenditure of labour in carrying and afterwards in threshing. There is a prejudice against the use of the binder in reaping barley, as it is impossible to secure uniformity of colour in the grain when the stalks are tightly tied in the sheaf, and the sun has not free access to those on the inside. In any case it must not be stacked while damp, and if cut by machine is therefore sometimes tied in sheaves and set up in stooks as in the case of wheat. The above sketch indicates the general principles of barley-cultivation, but in practice they are often modified by local custom or farming exigencies.

Barley is liable to smut and the other fungus diseases which attack wheat (q.v.), and the insect pests which prey on the plants are also similar. The larvae of the ribbon-footed corn-fly (Chlorops taeniopus) caused great injury to the barley crop in Great Britain in 1863, when they are described as being as numerous as fair corn of barley yields about 36 bushels (56 lb. to the bushel) per acre, but under the best conditions 40 and 50 bushels may be obtained. The yield of straw is from 15 to 20 cwt. per acre. Barley-straw is considered inferior both as fodder and litter.

BARLEY-BREAK, an old English country game frequently mentioned by the poets of the 17th and 18th centuries. It was played by three pairs composed of one of each sex, who were stationed in three bases or plots, contiguous to each other. The couple occupying the middle base, called hell or prison, endeavoured to catch the other two, who, when chased, might break to avoid being caught. If one was overtaken, he and his companion were condemned to hell. From this game was taken the expression "the last couple in hell," often used in old plays.

BARLEY-CORN, a grain of barley, and thus a measure taken from the length of a grain of barley, three of which (sometimes four) were considered to make up an inch. The barley-corn has been personified as representing the malt liquor made from barley, as in Burns's song "John Barleycorn."

BARLOW, SIR GEORGE HILARIO (1762-1837), Anglo-Indian statesman, was appointed to the Bengal Civil Service in 1778, and in 1788 carried into execution the permanent settlement of Bengal. When the marquess of Cornwallis died in 1805, Sir George Barlow was nominated provisional governor-general, and his passion for economy and retrenchment in that capacity has caused him to be known as the only governor-general who diminished the area of British territory; but his nomination was rejected by the home government, and Lord Minto was appointed. Subsequently Barlow was created governor of Madras, where his want of tact caused a mutiny of officers in the Bombay forces to break out. In 1812 he was recalled, and lived in retirement until his death in February 1847. He was created a baronet in 1803.

BARLOW, JOEL (1754-1812), American poet and politician, born in Redding, Fairfield county, Connecticut, on the 24th of March 1754. He graduated at Yale in 1778, was a post-graduate student there for two years, and from September 1780 until the close of the revolutionary war was chaplain in a Massachusetts brigade. He then, in 1783, removed to Hartford, Connecticut, established there in July 1784 a weekly paper, the American Mercury, with which he was connected for a year, and in 1786 was admitted to the bar. At Hartford he was a member of a group of young writers including Lemuel Hopkins, David Humphreys, and John Trumbull, known in American literary history as the "Hartford Wits." He contributed to the Anarchiad, a series of satirico-political papers, and in 1787 published a long and ambitious poem, The Vision of Columbus, which gave him a considerable literary reputation and was once much read. In 1798 he went to France as the agent of the Scioto Land Company, which was seeking to sell lands and enlist immigrants. He seems to have been swindled out of some millions by the company, which failed disastrously in 1799. He had previously, however, induced the company of Frenchmen, who ultimately founded Gallipolis, Ohio, to emigrate to America. In Paris he became a liberal in religion and an advanced republican in politics. He remained abroad for several years, spending much of his time in London; was a member of the obnoxious "London Society for Constitutional Information"; published various radical essays, including a volume entitled Advice to the Privileged Orders (1792), which was proscribed by the British government; and was made a citizen of France in 1792. He was American consul at Algiers in 1795-1797, securing the release of American prisoners held for ransom, and negotiating a treaty with Tripoli (1796). He returned to America in 1805, and lived near Washington, D.C., until 1811, when he became American plenipotentiary to France, charged with negotiating a commercial treaty with Napoleon, and with securing the restoration of confiscated American property or indemnity therefor. He was summoned for an interview with Napoleon at Wilna, but failed to see the Emperor. He was subsequently impeached by the British House of Commons for having broken the terms of the treaty. and, over-come by exposure, died at the Polish village of Zarnowiec on the 24th of December 1812. In 1807 he had published in a sumptuous volume the Columbiad, an enlarged edition of his Vision of Columbus, more pompous even than the original; but, though it added to his reputation in some quarters, on the whole it was not well received, and it has subsequently been much ridiculed. The poem for which he is now best known is his mock heroic Hasty Pudding (1793). Besides the writings mentioned above, he published Conspiracy of Kings, a Poem addressed to...
the Inhabitants of Europe from another Quarter of the Globe (1792); View of the Public Debt, Receits and Expenditure of the United States (1800); and the Political Writings of Joel Barlow, 1st ed., 1796). He also published an edition, "corrected and enlarged," of Isaac Watt's *Imitation of the Psalms of David* (1786).

**BARLOW, PETER** (1776–1862), English writer on pure and applied mathematics, was born at Norwich in 1776 and died on the 1st of March 1862. In 1808 he was appointed mathematical master in the Woolwich Academy, and filled that post for forty-one years. In 1823 he was made a fellow of the Royal Society, and two years later received the Copley medal. Steam locomotion received much attention at his hands, and he sat on the railway commissions of 1835, 1839, 1842, 1843. He received many distinctions from British and foreign scientific societies.

Barlow's principal works are—*Elementary Investigation of the Theory of Numbers* (1811); *New Mathematical and Philosophical Dictionary* (1814); *Essay on Magnetic Attractions* (1820). The investigations on magnetism led to the important practical discovery of a means of rectifying or compensating compass errors at sea. Besides compiling numerous useful tables, he contributed largely to the *Encyclopaedia Metropolitana*.

**BARM (a word common to Teutonic languages)**, the scum formed on the top of malt liquor when fermenting; yeast used to leaven bread, or to set up fermentation in liquor.

**BARMECIDES**, more accurately BARMAXIDS, a noble Persian family which attained great power under the Abbasid caliphs. Barnak, the founder of the family, was a Persian fire-worshipper, and is supposed to have been a native of Khorasan. According to tradition, his wife was taken for a time into the harem of Abdallah, brother of Kobaia the conqueror of Balkh, and became the mother of Khalid b. Barnak the Barmecide. Barnak subsequently (about A.D. 736) rebuilt and adorned his native city of Balkh after the rebellion of Harith. The family prospered, and his grandson Yahya b. Khalid was the vizier of the caliph Mahdi and tutor of Harun al-Rashid. His sons Fadl and Ja’far (the Giafar of the Arabian Nights) both occupied high offices under Harun. The story of their disgrace, though romantic, is not improbable. Harun. It is said, found his chief pleasure in the society of his sister ‘Abbasah and Ja’far, and in order that these two might be with him continuously without breach of etiquette, persuaded them to contract a purely formal marriage. The conditions were, however, not observed and Harun, learning that ‘Abbasah had borne a son, caused Ja’far suddenly to be arrested and beheaded, and the rest of the family except Mahommed, Yahya’s brother, to be imprisoned and deprived of their property. It is probable, however, that Harun’s anger was caused to a large extent by the insinuations of his courtiers that he was a mere puppet in the hands of a powerful family. See further CALIPHATE, section C, §§ 4, 5.

The expression “Barmecide Feast,” to denote an imaginary banquet, is drawn from one of the tales (“The Barber’s Tale of His Sixth Brother”) in the Arabian Nights, in which a series of empty dishes is served up to a hungry man to test his sense of humour by one of the Barmecides (see edition by C. E. Smithers, London, 1894, vol. i. 317).

**BARMEN**, a town of Germany, in the Prussian Rhine province and an important governmental district of Düsseldorf. Pop. (1816) 19,030; (1819) 116,144; (1905) 156,428. It is served by the main railway from Berlin to Aix-la-Chapelle, and lies immediately east of Elberfeld, with which it virtually forms one town. It stretches for some 4 m. along the narrow valley of the river Wupper, which, within the municipal boundaries, is crossed by twenty bridges. High wooded hills surround it. It is divided into three main districts, Upper, Middle and Lower Barmen, and is connected, throughout its length, with Elberfeld, by railway, tramway, and a suspended trolley line, hanging over the bed of the Wupper. It contains nine Evangelical and two Roman Catholic churches, a stately modern town hall, a Hall of Fame (Ruhmes-}

**halle), with statues of the emperors William I. and Frederick III., a theatre, a picture-galley, an ethnographical museum, and art exchange. There are many public monuments, one to Bismarck, another to the poet Emil Rittter von Döblin (1854–1897), a native of the town, and one commemorating the Franco-German War of 1870–71. There are several high-grade public schools, academies of technical science, engineering and textile industry, and a missionary theological seminary. Barmen is one of the most important manufacturing centres of Germany. The rapid development of its commercial activity only dates from the beginning of the 19th century. It is the chief seat of ribbon weaving in Germany, and manufactures thread, lace, brads, cotton and cloth goods, carpets, silks, machinery, steel works, plated goods and buttons, the last industry employing about 15,000 hands. There are numerous bleaching-fields, print-works and dyeworks famous for their Turkey-red, soap works, chemical works and potteries. There are also extensive breweries. Its export trade, particularly to the United States, is very considerable. The hills lying S. of the town are laid out in public grounds. Here are a health resort, a tower commanding an extensive view, and numerous villas. Barmen, although mentioned in chronicles in the 12th century, did not attain civic rights until 1808, when it was formed into a municipality by the grand-duke of Berg.

See A. Shakin, *Industrial Efficiency* (1906), for a good description of the industrial aspect.

**BARMOTE COURT** (also written BERGMOTE, BARMGOTE, BARMEMOTE, BARMOOT), a name applied to courts held in the lead-mining districts of Derbyshire, England, for the purpose of determining the customs peculiar to the industry and also for the settlements of any disputes which may arise in connexion with it. Barmote courts are of very ancient origin, having been in existence in the reign of Edward I. Their jurisdiction extends both to the crown lands in the duchy of Lancaster and to those under individual ownership, comprising seven clearly defined districts. Owing to the progress made in modern mining, many of the customs and much of the procedure had become obsolete, and their powers were regulated by the High Peak Mining Customs and Mineral Courts Act 1831. An appeal from the jurisdiction of the courts lies by way of certiorari.

**BARMOUTH** (Abermaw, mouth of the Maw, or Mawddach, in Cardigan Bay, the only haven in Merionethshire, North Wales), a small port and market on the north of the estuary. Pop. of urban district (1901) 221. The river Mawddach (Dolgallog) is fine. The parish church, Llanaber, 13 m. from Barmouth, is on a cliff overlooking the sea. Barmouth is a favourite bathing place, on the Cambrian railway. It is a centre for coaching in summer, especially to and through the Vale of Llangollen.

**BARNABAS**, in the New Testament, the surname, according to Acts iv. 36, given by the apostles (possibly in contrast to Joseph Barsabbas, Acts i. 23) to Joseph, "a Levite, a man of Cyprus by birth," who, though like Paul not of the Twelve, came like him to rank as an apostle (Acts xiv. 4, 14, 1 Cor. ix. 6; see Barnabas). The Greek rendering of this Semitic name (σαρκαβάζωσ) may be translated "son of consolation" (as in the A. V.), or "son of exhortation" (as in the R. V.). But there is no certain evidence about the rendering of this name. The word occurs very rarely as a personal name in the LXX, and nowhere in the Talmud. It may be conjectured that it is of Aramaic origin, and is equivalent to *Paraklesis*, and then to take the latter in the sense of comfort or encouragement. This rendering, rather than "exhortation" in the sense of eloquence, best suits the usage of Acts, which suggests such comfort as is given by encouraging rather than rousing words (ix. 31, xi. 22, xiii. 15, xv. 31; cf. Luke ii. 25, vi. 24). All we hear of Barnabas points to goodness of heart ("a good man," xi. 24) as his distinctive quality, giving fineness of perception (ix. 27, xi. 25; f.) and large insight into essentials (xi. 23 f.). It was probably the practically helpful and encouraging form that his gift as a "prophet" took (Acts xii. i, viii. 25).
BARNABAS

with 1 Cor. xiv. 3). It is perhaps significant that his first appearance is of the generously helpful kind described in Acts iv. 36 f. Yet we must beware of regarding Barnabas as merely a fine character; "he plays too prominent a part in the New Testament for any such limitation. Thus, he next appears as bringing the suspicions which dogged the ex-persecutor Saul (Paul)—possibly an old acquaintance in Hellenist circles at Jerusalem (cf. vi. 9, ix. 29)—and introducing him to the older apostles (ix. 27). More suggestive still of high repute as a man of insight and authority is his mission from the Jerusalem Church to inspect and judge of the new departure in the Gospel at Antioch, in Acts xi. 22. This means very much, though his modesty led him to call in the aid of his friend Saul to cope with the new and expanding situation (25 f.). After their brief joint visit to Judaea and Jerusalem (xi. 30, xii. 25) we next get a glimpse of Barnabas as still chief among the spiritual leaders of the Antiochene Church, and as called by the Spirit, along with Saul, to initiate the wider mission of the Gospel, outside Syria even, in regions beyond (xii. 2, 4). He led the way to his native Cyprus; but in the crucial struggle with the magician Bar-Jesus, in the presence of the governor of the island (xiii. 7 ff.), Saul seems to have come so decisively to the front, that henceforth, for the author of Acts he takes the lead, and Barnabas appears as his colleague (see xiii. 13, 16, 26), and note the turning back of Mark, the kinsman of Barnabas. The fact that at Lystra the natives styled Barnabas, Zeus, and Paul, Hermes, while suggesting that Barnabas was the man of nobler mien, proves that Paul was the chief speaker (xiv. 12); and the notices in the Pauline epistles fully bear out the view that "the gospel of the Gentiles" which they preached was in conception Paul's (Gal. ii. 1-9). Indeed, Barnabas's ascension at Antioch, as recorded in Gal. ii. 11 ff. (whether it preceded or followed their mission in Acts xii-xiv.), shows that, while gifted with true intuitions, he was not strong in thinking out his position to all its issues on principle, and that it was here that Paul was so immensely his superior. But what Barnabas did see with full reasoned conviction, he was staunch in upholding; thus he upheld the general cause of Gentile freedom from the obligation of circumcision (as distinct from perfect religious equality with Jewish believers) at the Jerusalem conference (Acts xiv.) With this stand for principle, however, his main work, as a great link in the transition of the apostles from their Jewish to their Gentile form of life, lay in the success he reached toculo, and Acts transfer his attention wholly to Paul, after explaining how their roads parted under rather painful circumstances (xv. 37 ff.).

When Barnabas sailed with Mark to resUME work in Cyprus, the mists of history hide him from our sight. Only now and again do we catch fugitive and increasingly doubtful glimpses of him and his work. We learn from 1 Cor. ix. 6 that he adhered to Paul's principle of self-support in his mission work, and from Col. iv. 10 that his name was well known and respected at Colossae about a.d. 60. Tradition, which early regards him as one of the seventy (Clem. Alex.), carries him, plausibly enough, to Alexandria (Clem. Hom. i. 8, ii. 4; cf. the ascription to him of the Alexandrine Epistle of Barnabas). But the evidence for his having visited Rome (later tradition says also Milan) is stronger because more varied (Clem. Recog. i. 7, cf. Hom. i. 7; the early Acts Petri Vercellenses; and the late Cypriot Encomium), especially if we might trust the Western ascription to him of the epistle to the Hebrews, which begins with Tertullian (De Pud. 20). But this may itself be inference from its self-ascription (xii. 2) as a "word of exhortation," to the "son of exhortation" (Acts iv. 36) as its author. The legend of his missionary labours in Cyprus, including martyrdom at Salamis, is quite late and untrustworthy. The date of his death is uncertain, but he was probably no longer living when Acts was written (c. A.D. 75-80).

His was essentially a mediating rôle. He filled a position intermediate between Jewish and Pauline Christianity—one characteristic of Christian Hellenists generally. Hence he is spoken of with respect in the Cenonisms; while Paul, as a radical in relation to the Law, is disconntentenced. If we could confidently credit him with the authorship of the epistle to the Hebrews, we could conceive his theological standpoint more exactly. But, in any case, the Barnabas of history was a greater man than the Barnabas of modern tradition.

See W. Cunningham, Epistle of Barnabas, pp. xviii.-xlix.; O. Klaiber, Der Apostel Barnabas, sein Leben . . . (Mainz, 1876); articles s.v. in Enc. Biblica and Hastings's Dictionary of the Bible.

THE EPISTLE OF BARNABAS is one of the apocryphal books of the New Testament. At the end of the Codex Sinaiticus of the 4th century, as a sort of appendix to the New Testament, there stands an "Epistle of Barnabas." Here it is followed by the Shepherd of Hermes, while in an 11th-century MS., which contains also the Didaché, it is followed by two writings which themselves form an appendix to the New Testament in the Codex Alexandrinus. This means that it once enjoyed quasi-canonical authority, a fact amply borne out by what Eusebius (H. E. iii. 25) says as to its standing in the ancient Church. It was at Alexandria that its authority was greatest. Clem. comments on it, as on the canonical scriptures, in his Hypothypomes. Origen cites it in the same spirit as scripture (C. Celsum, i. 63, De Princ. iii. 2, 4, 7). Clem. further, ascribes it to ʻthe apostle or the prophet Barnabas (Strom. ii. 6, 31, cf. ii. 10, 116), with explicit reference to Paul's fellow-apostle. Internal evidence of the epistle itself lays any claim to such authorship. Lightfoot, indeed, suggests that its author was "some unknown namesake" of the famous Barnabas: but it is simpler to suppose that it was fathered upon the latter by the Alexandrian Church, ready to believe that so favourite a writing was of apostolic origin.

That Alexandria, the place of its earliest reception, was also the place of its birth, is borne out by the internal evidence of style and interpretation, which is Alexandrian throughout (Lightfoot). The picture, too, which it gives of the danger lest the Christianity of its readers should be unduly Judaic in feeling and practice, suits well the experiences of a writer living in Alexandria, where Judaism was immensely strong. Further, it shows an "astonishing familiarity with the Jewish rites," in the opinion of a modern Jew (Kohler in the Jewish Encycl.); but such, much so, that the latter agrees with another Jewish scholar in saying that "the writer seems to have been a converted Jew, whose fanatic zeal rendered him a bitter opponent of Judaism within the Christian Church." There is evidence for some Christian scholars that the writer often indulges in Jewish matters, the fact being that his knowledge is derived from the Judaism of Alexandria rather than Palestine. But we need not therefore regard the author as of Jewish birth. It is enough, and more in keeping with the thought as a whole, to regard him as having been in close contact with Judaism, possibly as a proselyte. He now uses his knowledge to warn his readers, with intense passion, against all compromise between Judaism and the Gospel. In this he goes so far as to deny any historical connexion between the two, maintaining with all the devices of an extravagant allegorism, including the Rabbinic Gematria based on the numerical values of letters (ix. 7 f.), that the Law and Prophecy, as meant by God, had never been given to Israel as a people. The Divine oracles had ever pointed to the Christian Covenant, and had been so understood by the men of God in Israel, whereas the apostate people had turned aside to keep the ceremonial letter of the Law at the instigation of an evil angel (ix. 4). In this way he takes in succession the typical Jewish institutions—Circumcision, Foods, Ablutions, Covenant, Sabbath, Temple—showing their spiritual counterpart in the New People and its ordinances, and that the Cross was prefigured from the first. Such insight (gnosis) into the reality of the case he regards as the natural issue of Christian faith; and it is his main object to help his readers to attain such spirituality—the more so that, by similar insight applied to the signs of the times, he knows and can show that the end of the present age is imminent (i. 5, 7-iv). The burden of his epistle, then, is, "Let us become

1 His reference to the wide prevalence of circumcision beyond Israel (ix. 6) is perhaps simply an exaggeration, more or less conscious.
spiritual, a perfect temple unto God” (iv. 11); and that not only by theoretic insight, but also by practical wisdom of life. In order to enforce this moral, he passes to “another sort of gnosia and instruction” (xviii. 1), viz. the precepts of the “Two Ways,” cited in a slightly different form from that found in the first part of the Teaching of the Apostles. The modifications, however, are all in a more spiritual direction, in keeping with the genuinely evangelic spirit which underlies and pervades even the allegorical ingenuities of the epistle.

Its opening shows it to have been addressed to a Church, or rather a group of Churches, recently visited by the writer, who, while not wishing to write as an authoritative “teacher” so much as one who has come to love them as a friend (i. 8, cf. i. 0), yet belongs to the class of “teachers” with a recognized spiritual gift (charisma), referred to e.g. in the Didache. He evidently feels in a position to give his gnosia with some claim to a deferential hearing. This being so, the epistle was probably written, not to Alexandria, but rather by a “teacher” of the Alexandrine Church to some body of Christians in Lower Egypt among whom he had recently been visiting. This would explain the absence of specific address, so that it appears as in form a “general epistle,” as Origen styles it. Its date has been much debated. But Lightfoot’s reading of the apocalyptic passage in ch. iv. with a slight modification suggested by Sir W. M. Ramsay—is really conclusive for the reign of Vespasian (A.D. 70-70). The main counter-view, in favour of a date about A.D. 130, can give no natural account of this passage, while it misconstrues the reference in ch. xvi. to the building of the spiritual temple, the Christian Church. Thus this epistle is the earliest of the Apostolic Fathers, and as such of special interest. Its central problem, the relation of Judaism and Christianity—of the Old and the New Forms of a Covenant which, as Divine, must in a sense abide the same—was one which gave the early Church much trouble; nor, in absence of a due theory of the education of the Church by gradual development, was it able to solve it satisfactorily.

Literature.—Besides collected editions of the Apostolic Fathers, see O. Braunsberger, Der Apostel Barnabus, ... u. der ihm beigelegte Brief (Mainz, 1876); W. Cunningham, Epistle of Barnabas (1877); sections in J. Donaldson, The Apostolic Fathers; E. Reuss, Théologie chrétienne, vol. ii, and in M. von Engelhardt, Das Christentum Justin des Martyrius; and Lightfoot’s fragmentary essay in his Clement of Rome, ii. 503-512. See also Apocryphal Literature, section “New Testament.”

Gospel of Barnabas.—We read in antiquity, e.g. in the Decretum Gelasii, of an apocryphal Gospel of Barnabas (see Apocryphal Literature), but we have no knowledge of its contents. There exists, however, in a single MS. in Italian a longish gospel, with this title, written from a Mahommedan standpoint, but probably embodying materials partly Gnostic in character and origin. The Italian MS. was found by the Deist, John Toland, in a private collection at Amsterdam (see his Naturaens, 1718); subsequently it came into the possession of Prince Eugene of Savoy, and finally was obtained with Eugene’s library by the imperial library at Vienna. It has been edited, with an English translation (1907) by (Rev.) Lonsdale and Laura Ragg, who held that it was the work of a Christian remnant in Mahommedanism about the 15th-16th century. See also preliminary notice in the Journal of Theol. Studies, vi. 424 ff. The old view held by Toland and others that the Italian was a translation from the Arabic is demonstrably wrong. The Arabic marginal notes are apparently partly pious ejaculations, partly notes for the aid of Arabic students. The work is highly imaginative and often grotesque, but it is pervaded by an unusually high ethical enthusiasm. A name applied to Crustacea of the order Caritipedia or Thyrostraca. Originally, the name was given to the stalked barnacles (Lepididae of C. Darwin), which attach themselves in great numbers to drift-wood and other objects floating in the sea and are one of the chief agents in the fouling of ships’ bottoms during long voyages. The sessile barnacles (Balansidae of Darwin) or “acorn shells” are found in myriads, encrusting the rocks between tide-marks on all coasts. One of the most extraordinary and persistent myths of medieval natural history, dating back to the 12th century at least, was the cause of transplanting to these organisms the name of the barnack or barnacle goose (Bernida branta). This bird is a winter visitor to Britain, and its Arctic nesting-places being then unknown, it was fabled to originate within the shell-like fruit of a tree growing by the sea-shore. In some variants of the story this shell is said to grow as a kind of mushroom on rotting timber in the sea, and is obviously one of the barnacles of the genus Lepas. Even after the scientific study of zoology had replaced the fabulous tales of medieval writers, it was a long time before the true affinities of the barnacles were appreciated, and they were at first classed with the Mollusca, some of which they closely resemble in external appearance. It was not till Vaughan Thompson demonstrated, in 1830, their development from a free-swimming and typically Crustacean larva that it came to be recognized that, in Huxley’s graphic phrase, “a barnacle may be said to be a Crustacean fixed by its head and kicking the food into its mouth with its legs.” For a systematic account of the barnacles and their allies, see the article Thyrsostra. (W.T.C.)

BARNARD, LADY ANNE (1750-1825), author of the ballad “Auld Robin Gray,” the eldest daughter of James Lindsay, 5th earl of Balcarres, was born at Balcarres House, Fife, on the 12th of December 1750. She was married in 1793 to Andrew Barnard, a son of the bishop of Limerick, for whom she obtained from Henry Dundas (1st Viscount Melville) an appointment as colonial secretary at the Cape of Good Hope. Thither the Barnards went in March 1797, Lady Anne remaining at the Cape until January 1802. A remarkable series of letters written by Lady Anne thence to Dundas, then secretary for war and the colonies, was published in 1901 under the title South Africa a Century Ago. In 1806, on the reconquest of the Cape by the British, Barnard was reappointed colonial secretary, but Lady Anne did not accompany him thither, where he died in 1807. The rest of her life was passed in London, where she died on the 6th of May 1825. “Auld Robin Gray” was written by her in 1772, to music by the Rev. William Leeses (1748-1828), as he admitted in 1812. It was published anonymously in 1783, Lady Anne only acknowledging the authorship of the words two years before her death in a letter to Sir Walter Scott, who subsequently edited it for the Bannatine Club with two continuations.

See the memoir by W. H. Wilkins, together with the original text of “Auld Robin Gray,” prefixed to South Africa a Century Ago.

BARNARD, FREDERICK AUGUSTUS PORTER (1809-1866), American scientist and educationalist, was born in Sheffield, Massachusetts, on the 5th of May 1809. In 1828 he graduated, second on the honour list, at Yale. He was then in turn a tutor at Yale, a teacher (1831-1832) in the American Asylum for the
BARNARD—BARNARD CASTLE

Deaf and Dumb at Hartford, Connecticut, and a teacher (1832–1858) in the New York Institute for the Instruction of the Deaf and Dumb. From 1838 to 1848 he was professor of mathematics and natural philosophy, and from 1848 to 1854 was professor of chemistry and natural history in the University of Alabama, for ten years, also, filling the chair of English literature. In 1854 he was ordained as deacon in the Protestant Episcopal Church. In the same year he became professor of mathematics and natural philosophy in the University of Mississippi, of which institution he was chancellor from 1856 until the outbreak of the Civil War, when, his sympathies being with the North, he resigned and went to Washington. There for some time he was in charge of the map and chart department of the United States Coast Survey. In 1864 he became the tenth president of Columbia College (now Columbia University) in New York City, which position he held until the year before his death, his service thus being longer than that of any of his predecessors. During this period the growth of the college was rapid; new departments were established; the elective system was greatly extended; more adequate provision was made for graduate study and original research, and the enrolment was increased from about 150 to more than 1000 students. Barnard strove to have educational privileges extended by the university to women as well as to men, and Barnard College, for women (see COLUMBIA UNIVERSITY), established immediately after his death, was named in his honour. He died in New York City on the 27th of April 1889. Barnard was a versatile man, of catholic training, a classical and English scholar, a mathematician, a physicist, and a chemist, a good public speaker, and a vigorous but sometimes what prolix writer on various subjects, his annual reports to the Board of Trustees of Columbia being particularly valuable as discussions of educational problems. Besides being the editor-in-chief, in 1872, of Johnson’s Universal Cyclopaedia, he published a Treatise on Arithmetic (1830); an Analytical Grammar with Symbolic Illustration (1836); Letters on Collegiate Government (1855); and Recent Progress in Science (1869).

BARNARD, GEORGE GREY (1863– ), American sculptor, was born at Bellefonte, Pennsylvania, on the 24th of May 1863. He first studied at the Art Institute, Chicago, and in 1883–1887 worked in P. T. Cavelier’s atelier at Paris. He lived in Paris for two years, 1887–1889, and with his first exhibit at the Salon of 1894 he scored a triumph. His principal works include, “The Boy” (1885); “Cain” (1886), later destroyed; “Brotherly Love,” sometimes called “Two Friends” (1887); the allegorical “Two Natures” (1894, in the Metropolitan Museum, New York City); “The Hewan” (1902, at Cairo, Illinois); “Great God Pan” (in Central Park, New York City); the “Rose Maiden”; the simple and graceful “Maidenhood”; and sculptural decorations for the new Capitol building for the state of Pennsylvania at Harrisburg.

BARNARD, HENRY (1811–1900), American educationalist, was born in Hartford, Connecticut, on the 24th of January 1811. He graduated at Yale in 1830, and in 1835 was admitted to the Connecticut bar. In 1837–1839 he was a member of the Connecticut legislature, effecting in 1838 the passage of a bill, framed and introduced by himself, which provided for “the better supervision of the common schools” and established a board of “commissioners of common schools” in the state. Of this board he was the secretary from 1838 till its abolition in 1842, and during this time worked indefatigably to reorganize and reform the common school system of the state, thus earning a national reputation as an educational reformer. In 1843 he was appointed by the governor of Rhode Island agent to examine the public schools of the state, and recommended improvements; and was one of the agents sent to receive out of the school system two years later. From 1845 to 1849 he was the first commissioner of public schools in the state, and his administration was marked by a decided step in educational progress. Returning to Connecticut, he was, from 1851 to 1855, “superintendent of common schools,” and principal of the State Normal School at New Britain, Conn. From 1859 to 1866 he was chancellor of the University of Wisconsin and agent of the board of regents of the normal school fund; in 1866 he was president of St John’s College, Annapolis, Maryland; and from 1867 to 1870 he was United States commissioner of education, and in this position he laid the foundation for the subsequent useful work of the Bureau of Education. His chief service to the cause of education, however, was rendered as the editor, from 1855 to 1881, of the American Journal of Education, the thirty-one volumes of which are a veritable encyclopaedia of education, one of the most valuable compendiums of information on the subject ever brought together through the agency of any one man. He also edited from 1838 to 1842, and again from 1851 to 1854, the Connecticut Common School Journal, and from 1846 to 1849 the Journal of the Rhode Island Institute of Instruction. He died at Hartford, Conn., on the 5th of July 1900. Among American educational reformers, Barnard is entitled to rank next to Horace Mann of Massachusetts.

BARNARD, JOHN, English musician, was a minor canon of St Paul’s in the reign of Charles I. He was the first to publish a collection of English cathedral music. It contains some of the finest 16th-century masterpieces, ranging from the “fausbourdon” style of Tallis’s Preces and Responses to the most developed types of full anthem. The text, however, is not trustworthy.

BARNARD CASTLE, a market-town in the Barnard Castle parliamentary division of Durham, England, 17 m. W. of Darlington by a branch of the North Eastern railway. Pop. of urban district (1901) 4425. It is beautifully situated on the steep left bank of the Tees. A noteworthy building in the town is the octagonal town-hall, dating from 1747. There are a few picturesque old houses, and a fragment of an Augustinian convent. St Mary’s church, in a variety of styles from Norman onward, contains some curious monuments; but the building of chief interest is the castle, which gives the town its name, and is the principal scene of Sir Walter Scott’s Robbery. The remains extend over a space of more than six acres. A remarkable building known as the Bowes’ Mansion and Museum, bequeathed in 1874 to the town by a descendant of Sir George Bowes, contains a valuable collection of works of art. In the vicinity of the town are Easby Abbey, beautifully situated on the Yorkshire bank of the river, Robey Park on the same bank, at the confluence of the Greta, and the massive 14th century castle of Raby to the north-east. The principal manufacture is shoe-thread. The corn-market is important.

As part of the lordship of Gainford, Barnard Castle is said to have been granted by William Rufus to Guy Baliol Bernard, son of Guy Baliol, who built the castle, and called it after himself, Castle Bernard. To the men of the town which grew up outside the castle walls he gave, about the middle of the 12th century, a charter making them burgesses and granting them the same privileges as the town of Richmond in Yorkshire. This charter was confirmed by Bernard Baliol, son of the above Bernard. Other confirmation charters were granted to the town by Hugh, John, and Alexander Baliol. The castle and lordship remained in the hands of the Balisols until John Baliol, king of Scotland, forfeited them with his other English estates in 1296. Barnard Castle was then seized by Anthony, bishop of Durham, as being within his patriminate of Durham. Edward I, however, denied the bishop’s rights and granted the castle and town to Guy Beauchamp, earl of Warwick, whose descendants continued to hold them until they passed to the crown by the marriage of Anne Neville with Richard III., then duke of Gloucester. In 1650 Barnard Castle was sold to Sir Henry Vane, and in the same year the castle is said to have been unroofed and dismantled for the sake of the materials of which it was built. Tanning leather was formerly one of the chief industries of the town. In 1614 an act for “knights and burgesses to have place in parliament for the county palatine and city of Durham and borough of Barnard
Castle" was brought into the House of Commons, but when the act was finally passed for the county and city of Durham, Barnard Castle was not included.

**BARNARDO, THOMAS JOHN** (1845–1905), English philanthropist, and founder and director of homes for destitute children, was born at Dublin, Ireland, in 1845. His father was of Spanish origin, his mother being an Englishwoman. With the intention of qualifying for medical missionary work in China, he studied medicine at the London hospital, and later at Paris and Edinburgh, where he became a fellow of the Royal College of Surgeons. His medical work in the east end of London during the epidemic of cholera in 1865 first drew his attention to the great numbers of homeless and destitute children in the cities of England. Encouraged by the support of the seventh earl of Shaftesbury and the first Earl Cairns, he gave up his early ambition of foreign missionary labour, and began what was to prove his life’s work. The first of the "Dr Barnardo’s Homes" was opened in 1867 in Stepney Causeway, London, where are still the headquarters of the institution. From that time the work steadily increased until, at the time of the founder’s death, in 1905, there were established 112 district "Homes," besides mission branches, throughout the United Kingdom. The object for which these institutions were started was to search for and to receive waifs and strays, to feed, clothe, educate, and, where possible, to give an industrial training suitable to each child. The principle adopted has been that of free and immediate admission; there are no restrictions of age or sex, religion or nationality; the physically robust and the incurably diseased are alike received, the one necessary qualification being destitution. The system under which the institution is carried on is broadly as follows:—the infants and younger girls and boys are chiefly boarded out in rural districts; girls above fourteen years of age are sent to the industrial training homes, to be taught useful occupations; boys above seventeen years of age are first tested in labour homes and then placed in emigrant homes, sent to sea or emigrated; boys between thirteen and seventeen years of age are trained for the various trades for which they may be mentally or physically fitted. Besides the various branches necessary for the foregoing work, there are also, among others, the following institutions:—a rescue home for girls in danger, a convalescent seaside home, and a hospital for sick waifs. In 1872 was founded the girls’ village home at Barkingside, near Ilford, with its own church and sanatorium, and between sixty and seventy cottage homes, forming a real "garden city"; and there Barnardo himself was buried. In 1901, through the generosity of Mr E. H. Watts, a naval school was started at North Elmham, near Norwich, to which boys are drafted from the homes to be trained for the navy and the mercantile marine. Perhaps the most useful of all the varied work instituted by Barnardo is the emigration system, by which means thousands of boys and girls have been sent to British colonies, chiefly to Canada, where there are distributing centres at Toronto and Winnipeg, and an industrial farm extending some 8000 acres near Russell in Manitoba. The fact that in Canada less than 2% of the children sent out proved failures confirmed Barnardo’s conviction that "if the children of the slums can be removed from their surroundings early enough, and can be kept sufficiently long under training, heredity counts for little, environment for almost everything." In 1890 the various institutions and organizations were legally incorporated under the title of "The National Association for the reclamation of Destitute Waif Children," but the institution has always been familiarly known as "Dr Barnardo’s Homes." Barnardo laid great stress on the religious teaching of the children under his care. Each child is brought up under the influence and teaching of the denomination of the parents. The homes are divided into two sections for religious teaching, Church of England and Non-conformists; children of Jewish and Roman Catholic parentage are, where possible, handed over to the care of the Jewish Board of Guardians in London, and to Roman Catholic institutions, respectively. From the foundation of the homes in 1867 to the date of Barnardo’s death, nearly 60,000 children had been rescued, trained and placed out in life. Barnardo died of angina pectoris in London on the 10th of September 1905. A national memorial was instituted to form a fund of £250,000 to relieve the various institutions of all financial liability and to place the entire work on a permanent basis. Dr William Baker, formerly the chairman of the council, was selected to succeed the founder of the homes as director. Barnardo was the author of many books dealing with the charitable work to which he devoted his life.

His biography (1907) was written by his wife (the daughter of Mr William Elmslie) and J. Marchant.

**Barnaun, a town of Asiatic Russia, government of Tomsk, standing in a plain bounded by foothills of the Altai Mountains, and on the Barnaulka river, at its confluence with the Ob, in lat. 53° 20’ N. and long. 83° 46’ E., 220 m. S. of Tomsk. It is the capital of the Altai mining districts, and besides smelting furnaces possesses glassworks, a bell-foundry and a mint. It has also a meteorological observatory, established in 1841, a mining school and a museum with a rich collection of mineral and zoological specimens. Barnaul was founded in 1750 by A. Demidov, to whose memory a monument has been erected. Pop. (1896) 20,830.

**Barnave, Antoine Pierre Joseph Marie** (1761–1793), one of the greatest orators of the first French Revolution, was born at Grenoble in Dauphiné, on the 22nd of October 1761. He was of a Protestant family. His father was an advocate at the parlement of Grenoble, and his mother was a woman of high birth, superior ability and noble character. He was educated by his mother because, being a Protestant, he could not attend school, and he grew up at once thoughtful and passionate, studious and social, handsome in person and graceful in manners. He was brought up to the law, and at the age of twenty-two made himself favourably known by a discourse pronounced before the local parlement on the division of political powers. Dauphiné was one of the first of the provinces to feel the excitement of the coming revolution; and Barnave was foremost to give voice to the general feeling, in a pamphlet entitled Épitaphe des édités en 1792. He was immediately elected deputy, with his father, to the states of Dauphiné, and took a prominent part in their debates. A few months later he was transferred to a wider field of action. The states-general were convoked at Versailles for the 5th of May 1789, and Barnave was chosen deputy of the tiers état for his native province. 

He soon made an impression on the Assembly, became the friend of most of the leaders of the popular party, and formed with Adrien Duport and Alexandre Lameth (q.v.) the group known during the Constituent Assembly as "the triumvirate." He took part in the conference on the claims of the three orders, drew up the first address to the king, and supported the proposal of Sieyes that the Assembly should declare itself National. Until 1792 he was one of the principal members of the club known later as the Jacobins, of which he drew up the manifesto and first rules (see Jacoobins). Though a passionate lover of liberty, he hoped to secure the freedom of France and her monarchy at the same time. But he was almost unawares borne away by the mighty currents of the time, and he took part in the attacks on the monarchy, on the clergy, on church property, and on the provincial parlements. With the common exception of Mirabeau, Barnave was the most powerful orator of the Assembly. On several occasions he stood in opposition to Mirabeau. After the fall of the Bastille he wished to save the throne. He advocated the suspension veto, and the establishment of trial by jury in civil causes, but voted with the Left against the system of two chambers. His conflict with Mirabeau on the question of assigning to the king the right to make peace or war (from the 16th to the 23rd of May 1791) was one of the most striking scenes in the Assembly.

In August 1790, after a vehement debate, he fought a duel with J. A. M. de Casalès, in which the latter was slightly wounded. About the close of October 1790 Barnave was called to the presidency of the Assembly. On the death of Mirabeau a few months later, Barnave paid a high tribute to his worth and public services, designating him the Shakespeare of oratory. On the arrest of the king and the royal family at Varennes, while attempting to escape from France, Barnave was
one of the three appointed to conduct them back to Paris. On the journey he was deeply affected by the mournful fate of Marie-Antoinette, and resolved to do what he could to alleviate their sufferings. In one of his most powerful speeches he maintained the inviolability of the king’s person. His public career came to an end with the close of the Constituent Assembly, and he returned to Grenoble at the beginning of 1792. His sympathy and relations with the royal family, to whom he had submitted a plan for a counter-revolution, and his desire to check the downward progress of the Revolution, brought on him suspicion of treason. Denounced (15th of August 1792) in the Legislative Assembly, he was arrested and imprisoned for ten months at Grenoble, then transferred to Fort Barraux, and in November 1793 to Paris. The nobility of his character was proof against the assaults of suffering. “Better to suffer and to die,” he said, “than lose one shade of my moral and political character.” On the 28th of November he appeared before the Revolutionary Tribunal. He was condemned on the evidence of papers found at the Tuileries and executed the next day, with Duport-Dutertre.

**BARNBY, SIR JOSEPH** (1838–1896), English musical composer and conductor, son of Thomas Barnby, an organist, was born at York on the 12th of August 1838. He was a chorister at York minster from the age of seven, was educated at the Royal Academy of Music under Cipriani Potter and Charles Lucas, and was appointed in 1852 organist of St Andrew’s, Wells Street, London, where he raised the services to a high degree of excellence. He was conductor of “Barnby’s Choir” from 1864, and in 1871 was appointed, in succession to Gounod, conductor of the Albert Hall Choral Society, a post he held till his death. In 1875 he was precentor and director of music at Eton, and in 1882 became principal of the Guildhall School of Music, receiving the honour of knighthood in July of that year. His works include an oratorio *Rebekah, Ps. cxvii.*, many services and anthems, and two hundred and forty-six hymn-tunes (published in 1897 in one volume), as well as some part-songs (among them the popular “Sweet and Low”), and some pieces for the organ. As a conductor he expressed the qualities as well as the defects of the typical north-countryman; if he was wanting in the higher kind of imagination or ideality, he infused into those who sang under him something of his own rectitude and precision. He was largely instrumental in stimulating the love for Gounod’s sacred music among the less educated part of the London public, although he displayed little practical sympathy with opera. On the other hand, he organized a remarkable concert performance of *Parsifal* at the Albert Hall in London in 1884. He conducted the Cardiff Festivals of 1892 and 1895. He died in London on the 28th of January 1896, and after a special service in St Paul’s cathedral was buried in Norwood Cemetery.

**BARNES, ALBERT** (1798–1870), American theologian, was born at Rome, New York, on the 1st of December 1798. He graduated at Hamilton College, Clinton, N.Y., in 1820, and at the Princeton Theological Seminary in 1823, was ordained as a Presbyterian minister by the presbytery of Elizabeth-town, New Jersey, in 1825, and was the pastor successively of the Presbyterian Church in Morristown, New Jersey (1825–1830) and of the First Presbyterian Church of Philadelphia (1830–1865). He held a prominent place in the New School branch of the Presbyterians, to which he adhered on the division of the denomination in 1837; he had been tried (but not convicted) for heresy in 1836, the charge being particularly against the views expressed by him in *Notes on Romans* (1835) of the imputation of the sin of Adam, original sin and the atonement; the bitterness stirred up by this trial contributed towards widening the breach between the conservative and the progressive elements in the church. He was an eloquent preacher, but his reputation rests chiefly on his expository works, which are said to have had a larger circulation both in Europe and America than any others of their class. Of the well-known *Notes on the New Testament* it is said that more than a million volumes had been issued by 1870. The *Notes on Job*, the Psalms, Isaiah and Daniel, found scarcely less acceptance. Displaying no original critical power, their chief merit lies in the fact that they bring in a popular (but not always accurate) form the results of the criticism of others within the reach of general readers. Barnes was the author of several other works of a practical and devotional kind, and a collection of his *Theological Works* was published in Philadelphia in 1875. He died in Philadelphia on the 24th of December 1870.

**BARNES, BARNABE** (1569?–1609), English poet, fourth son of Dr Richard Barnes, bishop of Durham, was born in Yorkshire, perhaps at Stonegrave, a living of his father’s, in 1568 or 1569. In 1586 he entered at Brasenose College, Oxford, where Giovanni Florio was his tutor, and in 1591 went to France with the earl of Essex, who was then serving against the prince of Parma. On his return he published *Parthenophyl and Parthenopie*, *Sonnettes*, *Martridges, Eligies, and Odes* (cont. on Stationers’ Register 1593), dedicated to his “dearest friend,” William Percy, who contributed a sonnet to the eulogies prefixed to a later work, *Offices*. *Parthenophyl* was possibly printed for private circulation, and the copy in the duke of Devonshire’s library is better than the uncorrected copy, in which Perse acquainted the duke with the work of contemporary French sonneteers, to whom he was largely indebted, and he borrows his title, apparently, from a Neapolitan writer of Latin verse, Hieronymus Angerianus.

It is possible to outline a story from this series of love lyrics, but the incidents are slight, and in this case, as in other Elizabethan sonnet-cycles, it is difficult to dogmatize as to what is the expression of a real personal experience, and what is intellectual exercise in imitation of Petrarch. *Parthenophyl* abounds in passages of great freshness and beauty, although its elaborate conceits are sometimes over-ingenious and strained. Barnes took the part of Gabriel Harvey and even experimented in classical metres. This partisanship is sufficient to account for the abuse of Thomas Nashe, who accused him, apparently on no proof at all, of stealing a nobleman’s chain at Windsor, and of other things. Barnes’s second work, *A Divine Century of Spiritual Sonnettes*, appeared in 1595. He also wrote two plays:—*The Devil’s Charter* (1609), a tragedy dealing with the life of Pope Alexander VI., which was played before the king; and *The Battle of Evesham* (or Hexham), of which the MS., traced to the beginning of the 18th century, is in the Medics. Dedicated to King James Offices enabling privit Persons for the special service of all good Princes and Policies, a prose treatise containing, among other things, descriptions of Queen Elizabeth and of the earl of Essex. Barnes was buried at Durham in December 1609.

**BARNES, SIR EDWARD** (1776–1838), British soldier, entered the 47th regiment in 1792, and quickly rose to field rank. He was promoted lieutenant-colonel in 1807, and colonel in 1810, and two years later went to the Peninsula to serve on Wellington’s staff. His services in this capacity gained him further promotion, and as a major-general he led a brigade in the Pyrenees under Wellington. He had the cross and three clasps for his Peninsula service. As adjutant-general he served in the campaign of 1815 and was wounded at Waterloo. Already a K.C.B., he now received the Austrian order of Maria Theresa, and the Russian order of St Anne. In 1819 began his connexion with Ceylon, of which island he was governor from 1824 to 1831. He directed the construction of the great military road between Colombo and Kandy, and of many other lines of communication, made the first census of the population, and introduced coffee cultivation on the West Indian system (1824). In 1831 he received the G.C.B., and from 1831 to 1853 he was commander-in-chief in India, with the local rank of general. On his return home, after two unsuccessful attempts to secure the seat, he became M.P. for Sudbury in 1837, but he died in the following...
year. Sir Edward Barnes' portrait was painted, for Ceylon, by John Wood, and a memorial statue was erected in Colombo.

BARNES, JOSHUA (1654–1715), English scholar, was born in London on the 10th of January 1654. Educated at Christ's Hospital and at Emmanuel College, Cambridge, he was in 1695 chosen regius professor of Greek, a language which he wrote and spoke with the utmost facility. One of his first publications was entitled Gerania; a New Discovery of a Little Sort of People, anciently discoursed of, called Pygmies (1675), a whimsical sketch to which Swift's Voyage to Lilliput possibly owes something. Among his other works are a History of that Most Victorious Monarch Edward III. (1688), in which he introduces long and elaborate speeches into the narrative; editions of Euripides (1694) and of Homeç (1711), also one of Anacreon (1705) which contains titles of Greek verses of his own which he hoped to publish. He died on the 3rd of August 1712, at Hemingford, near St Ives, Huntingdonshire.

BARNES, ROBERT (1495–1540), English reformer and martyr, born about 1495, was educated at Cambridge, where he was a member, and afterwards prior of the convent of Austin Friars, and graduated D.D. in 1523. He was apparently one of the Cambridge men who were wont to gather at the White Horse Tavern for Bible-reading and theological discussion early in the third decade of the 16th century. In 1526, he was brought before the vice-chancellor for preaching a heterodox sermon, and was subsequently examined by Wolsey and four other bishops. He was condemned to abjure or be burnt; and preferring the former alternative, was committed to the Fleet prison and afterwards to the Austin Friars in London. He escaped thence to Antwerp in 1528, and also visited Wittenberg, where he made Luther's acquaintance. He also came across Stephen Vaughan, an agent of Thomas Cromwell and an advanced reformer, who recommended him to Cromwell: "Look well, he wrote, "upon Dr Barnes' book. It is a piece of work as I have not yet seen any like it. I think he shall seal it with his blood." (Letters and Papers of Henry VIII, v. 593). In 1531 Barnes returned to England, and became one of the chief intermediaires between the English government and Lutheran Germany. In 1535 he was sent to Germany, in the hope of inducing Lutheran divines to approve of Henry's divorce from Catherine of Aragon, and four years later he was employed in negotiations connected with Anne of Cleves' marriage. The policy was Cromwell's, but Henry VIII. had already in 1538 refused to adopt Lutheran theology, and the statute of Six Articles (1539), followed by the king's disquit with Anne of Cleves (1540), brought the agents of that policy to ruin. An attack upon Bishop Gardiner by Barnes in a sermon at St Paul's Cross was the signal for a bitter struggle between the Protestant and reactionary parties in Henry's council, which raged during the spring of 1540. Barnes was forced to apologized and recant; and Gardiner delivered a series of sermons at St Paul's Cross to counteract Barnes' invective. But a month or so later Cromwell was made earl of Essex, Gardiner's friend, Bishop Sampson, was sent to the Tower, and Barnes reverted to Lutheranism. It was a delusive victory. In July, Cromwell was attainted, Anne of Cleves was divorced and Barnes was burnt (30th July 1540). He also had an act of attainder passed against him, a somewhat novel distinction for a heretic, which illustrates the way in which Henry VIII. employed secular machinery for ecclesiastical purposes, and regarded heresy as an offence against the state rather than against the church. Barnes was one of six executed on the same day; two, William Jerome and Thomas Gerard, were, like himself, burnt for heresy under the Six Articles; three, Thomas Abel, Richard Fetherstone and Edward Powell, were hanged for treason in denying the royal supremacy. Both Lutherans and Catholics on the continent were shocked. Luther published Barnes' confession with a preface of his own as Bekennniss des Glaubens (1540), which is included in Walch's edition of Luther's Werke xvi. 186.

Pocock; Dixon's Hist. of the Church; Gairdner's Church in the XVIIth Century; Pollard's Henry VIII. and Cranmer; Herzog-Hauck, Realencyclopädie, 3rd ed. (A. F. P.)

BARNES, THOMAS (1785–1841), British journalist, was born about 1785. Educated at Christ's Hospital and Pembroke College, Cambridge, he came to London and soon joined the famous literary circle of which Hunt, Lamb and Hazlitt were prominent members. Upon the retirement of Dr Stoddart in 1817 he was appointed editor of The Times, a position which he held until his death, when he was succeeded by Delane. Lord Lyndhurst gave expression to a very widely-held opinion when he described him as "the most powerful man in the country." He died on the 7th of May 1841.

BARNES, WILLIAM (1800–1889), the Dorsetshire poet, was born on the 22nd of February 1800, at Rushay, near Pentridge in Dorset, the son of John Barnes and Grace Scott, of the farmer class. He was a delicate child, in direct contrast to a strong race of Dorsetshire farmers; and infatuated from his mother a refined, retiring disposition and a love for books. He went to school at Sturminster Newton, where he was considered the clever boy of the school; and when a solicitor named Dashwood applied to the master for a quick-witted boy to join him as pupil, Barnes was selected for the post. He worked with the village parson in his spare hours at classics and studied music under the organist. In 1818 he left Sturminster for the office of one Coombs at Dorchester, where he continued his evening education with another kindly clergyman. He also made great progress in the art of wood-engraving, and with the money he received for a series of blocks for a work called Walks about Dorchester, he printed and published his first book, Orra, a Lapland Tale, in 1832. In the same year he became engaged to Julia Miles, the daughter of an excise officer. In 1832 he took a school at Mere in Wiltshire, and four years later married and settled in Chantry House, a fine old Tudor mansion in that town. The school grew in numbers, and Barnes occupied all his spare time in assiduous study, reading during those years authors so diverse in character as Herodotus, Sallust, Ovid, Petrarch, Buffon and Burns. He also began to write poetry, and printed many of his verses in the Dorset County Chronicle. His chief studies, however, were philological; and in 1829 he published An Etymological Glossary of English Words of Foreign Derivation. In 1832 a stimulating company of actors visited Mere, and Barnes wrote a farce, The Honest Thief, which they produced, and a comedy which was played at Wincanton. Barnes also wrote a number of educational books, such as Elements of Perspective, Outlines of Geography, and in 1833 first began his poems in the Dorsetshire dialect, among them the two odes "The Lotments" and "A Bit o' Sly Cooren," in the pages of the local paper. In 1836 he left Mere, and returned to Dorchester, where he started another school, removing in 1837 to larger quarters. In 1844 he published Poems of Rural Life in the Dorset Dialect. Three years later Barnes took holy orders, and was appointed to the cure of Whitcombe, 3 m. from Dorchester. He had been for some years upon the books of St John's College, Cambridge, and took the degree of B.D. in 1850. He resigned Whitcombe in 1852, finding the work too hard in connexion with his mastership; and in June of that year he sustained a severe bereavement by the death of his wife. Continuing his studies in the science of language, he published his Philological Grammar in 1854, drawing examples from more than sixty languages. For the copyright of this erudite work he received £5. The second series of dialect poems, Huwomly Rhymes, appeared in 1859 (2nd ed. 1863). Huwomly Rhymes contained some of his best-known pieces, and in the year of its publication he first began to give readings from his works. As their reputation grew he travelled all over the country, delighting audiences with his quaint humour and natural pathos. In 1861 he was awarded a civil list pension of £100 a year, and in the next year published Tis, the most striking of his philosophical studies, in which the Teutonic roots in the English language are discussed. Barnes had a horror of Latin forms in English, and would have substituted English compounds for many Latin forms in common use. In 1862 he broke up his school, and
removed to the rectory of Winterborne Came, to which he was presented by his old friend, Captain Seymour Dawson Damer. Here he worked continuously at verse and prose, contributing largely to the magazines. A new series of Poems of Rural Life in the Dorset Dialect appeared in 1852, and he was persuaded in 1868 to publish a series of Poems of Rural Life in Common English, which was less successful than his dialect poems. These latter were collected into a single volume in 1879, and on the 7th of October 1886 Barnes died at Winterborne Came. His poetry is essentially English in character; no other writer has given quite so simple and sincere a picture of the homely life and labour of rural England. His work is full of humour and the clean, manly joy of life; and its rusticity is singularly allied to a literary sense and to high technical finish. He is indeed the Victorian Theocritus; and, as English country life is slowly swept away before the advance of the railway and the telegraph, he will be more and more read for his warm-hearted and fragrant record of rustic love and piety. His original and suggestive books on the English language, which are valuable in spite of their eccentricities, include:—Se Gephyatai: An Anglo-Saxon Delectus (1849); A Grammar and Glossary of the Dorset Dialect (1864); An Outline of English Speech-Craft (1876); and A Grammar of the Dorset Dialect (Dorchester, 1886).

The poet is remembered by William Barnes, Poet and Philologist (1887), by his daughter, Lucy E. Baxter, who is known as a writer on art by the pseudonym of Leader Scott; and a notice by Thomas Hardy in the Athenæum (16th of October 1886).

Barnet, a residential district in the mid or St Albans parliamentary division of Hertfordshire, England; 10 m. N. of London, served by the main line and branches of the Great Northern railway. The three chief divisions are as follows:—(1) Chipping Barnet, a market town and urban district (Barnet), Pop. (1901) 7876. The second epithet designates its position on a hill, but the first is given it from the market granted to the abbots of St Albans to be kept there, by Henry II. Near the town, round a point marked by an obelisk, was fought in 1471 the decisive battle between the houses of York and Lancaster, in which the earl of Warwick fell and the Lancastrians were totally defeated. The town is on the Great North Road, on which it was formerly an important coaching station. A large annual horse and cattle fair is held. (2) East Barnet, 2 m. S.E. of Chipping Barnet, has an ancient parish church retaining Norman parts, though enlarged in modern times. Pop. of East Barnet Valley urban district, 10,094. (3) New Barnet lies 1 m. E. by S. from Chipping Barnet.

Friern Barnet, in the Enfield parliamentary division of Middlesex, lies 3 m. S. of Chipping Barnet. Pop. of urban district, 11,560. The prefix recalls the former lordship of the manor possessed by the priory of St John of Jerusalem in Clerkenwell, London. Friern Barnet adjoins Finchley on the north and Whetstone on the south, the whole district being residential.

Barnett, John (1802-1860), English musical composer, son of a Prussian named Bernhard Beer, who changed his name on settling in England as a jeweller, was born at Bedford, and at the age of eleven sang on the Lyceum stage in London. His good voice led to his being given a musical education, and he soon began writing songs and lighter pieces for the stage. In 1834 he published a collection of Lyric Illustrations of the Modern Poets, His Mountain Sylphwith which his name is chiefly connected—was played at the Lyceum on August 25, 1834, as the first modern English opera. It was followed by another opera Fair Rosamund in 1837, and by Farinelli in 1839. He had a large connexion as a singing-master at Cheltenham, and published Systems and Singing-masters (1842) and School for the Voice (1844). He died on the 16th of April 1860.

His nephew, John Francis Barnett (1837-1909), son of John's brother, Joseph Alfred, also a professor of music, carried on the traditions of the family as a composer and teacher. He obtained a law's scholarship at the Royal Academy of Music, and developed into an accomplished pianist, visiting Germany to study in 1857 and playing at a Gewandhaus concert at Leipzig in 1880. He came into notice as a composer with his symphony in A minor (1864), and followed this with a number of compositions for orchestra, strings or pianoforte. His cantata The Ancient Mariner was brought out at Birmingham in 1867, and another, Paradise and the Peri, in 1870, both with great success.

In 1873 his most important work, the oratorio The Raising of Lazarus, was written, and in 1876 produced at Hereford. Many other works, pianoforte pieces, &c were composed by him, and successfully brought out; and he took an active part as a composer in the work of the Guildhall School of Music and Royal College of Music.

Barnett, Samuel Augustus (1844—), English clergyman and social reformer, was born at Bristol on the 8th of February 1844, the son of Francis Augustus Barnett, an iron manufacturer. After leaving Wadham College, Oxford, in 1866, he visited the United States. Next year he was ordained to the curacy of St Mary's, Bryantson Square, and took priest's orders in 1868.

In 1872 he became vicar of St Jude's, Commercial Street, Whitechapel, and in the next year married Henrietta Octavia Rowland, who had been a co-worker with Miss Octavia Hill and was no less ardent a philanthropist than her husband. Mr and Mrs Barnett worked hard for the poor of their parish, opening evening schools for adults, providing them with music and reasonable entertainment, and serving on the board of governors of schools. Mr Barnett did much to discourage outdoor relief, as tending to the pauperization of the neighbourhood. At the same time the conditions of indoor relief were improved, and the various charities were co-ordinated, by co-operation with the Charity Organization Society and the parish board of guardians.

In 1875 Arnold Toynbee paid a visit, the first of many, to Whitechapel, and Mr Barnett, who kept in constant touch with Oxford, formed in 1877 a small committee, over which he presided himself, to consider the organization of university extension in London, his chief assistants being Leonard Montefiore, a young Oxford man, and Frederick Rogers, a member of the vellum binders' trade union. The committee received influential support, and in October four courses of lectures, one by Dr S. G. Gardner on English history, were given in Whitechapel. The Barnett's were also associated with the building of model dwellings, with the establishment of the children's country holiday fund and the annual loan exhibitions of fine art at the Whitechapel gallery. In 1884 an article by Mr Barnett in the Nineteenth Century discussed the question of university education. This resulted in July in the formation of the University Settlement Association, and when Toynbee Hall was built shortly afterwards Mr Barnett became its warden. He was a select preacher at Oxford in 1885-1897, and at Cambridge in 1900; he received a canonry in Bristol cathedral in 1893, but retained his wardenship of Toynbee Hall, while relinquishing the living of St Jude's. In June 1906 he was preferred to a canonry at Westminster, and when in December he resigned the wardenship of Toynbee Hall, the position of president was created so that he might retain his connexion with the institution. Among Canon Barnett's works is Practicable Socialism (1888, 2nd ed. 1894), written in conjunction with his wife.

Barnfield, Richard (1574-1627), English poet, was born at Norbury, Staffordshire, and baptized on the 13th of June 1574. His obscure though close relationship with Shakespeare has long made him interesting to students and has attracted of late years further attention from the circumstance that important discoveries regarding his life have been made. Until recently no one was known about the facts of Barnfield's career, whose very existence had been doubted. It was, however, discovered by the late Dr A. B. Grosart that the poet was the son of Richard Barnfield (or Barnfield) and Maria Smykrymer, his wife, who were married in April 1572. They resided in the parish of Norbury, in Staffordshire, on the borders of Salop, where the poet was baptized on the 13th of June 1574. The mother died in giving birth to a daughter early in 1581, and her unmarried sister, Elizabeth Smykrymer, seems to have devoted herself to the care of the children. In November 1580 Barnfield matriculated at Brasenose College, Oxford, and took his degree in
February 1592. He “performed the exercise for his master’s gown,” but seems to have left the university abruptly, without proceeding to the M.A. It is conjectured that he went up to London in 1593, and became acquainted with Watson, Drayton, and perhaps with Spenser. The death of Sir Philip Sidney had occurred while Barnfield was still a school-boy, but it seems to have strongly affected his imagination and to have inspired some of his earliest verses. In November 1594, in his twenty-first year, Barnfield published anonymously his first work, The Affectionate Shepherd, dedicated with familiar devotion to Penelope, Lady Rich. This was a sort of florid romance, in two books of six-line stanza, in the manner of Lodge and Shakespeare, dealing at large with “the complaint of Daphnis for the love of Ganymede.” As the author expressly admitted later, it was an expansion or paraphrase of Virgil’s second eclogue—

“Formosam pastor Corydon ardebat Alexim.”

This poem of Barnfield’s was the most extraordinary specimen hitherto produced in England of the literature introduced from Italy at the Renaissance. Although the poem was successful, it did not pass without censure from the moral point of view. Into the conventional outlines of The Affectionate Shepherd the young poet has poured all his fancy, all his epithets, and all his coloured touches of nature. To those who see the poem we are told that none of the immediate imitators of Venus and Adonis has equalled the juvenile Barnfield in the picturesque

ness of his “fine ruff-footed doves,” his “speckled flower call’d sops-in-wine,” or his desire “by the bright glimmering of the starry light, to catch the long-hill’d woodcock.” Two months later, in January 1595, Barnfield published his second volume, Cynthia, with certain Sonnets, and this time signed the preface, which was dedicated, in terms which imply close personal relations, to William Stanley, the new Earl of Derby. This is a book of extreme interest; it exemplifies the earliest study both of Spenser and Shakespeare. “Cynthia” itself, a panegyric on Queen Elizabeth, is written in the Spenserian stanza, of which it is probably the earliest example extant outside The Faerie Queene. This is followed by a sequence of twenty sonnets, which have the extraordinary interest that, while preceding the publication of Shakespeare’s sonnets by fourteen years, they are closer to them in manner than are any others of the Elizabethan age. They celebrate, with extravagant ardour, the charms of a young man whose initials seem to have been nothing to do with them. These sonnets, which preceded even the Amoretti of Spenser, are of unusual merit as poetry, and would rank as high in quality as in date of publication if their subject-matter were not so preposterous. They show the influence of Drayton’s Idea, which had appeared a few months before; in that collection also, it is to be observed, there had appeared amatory sonnets addressed to a young man. If editors would courageously alter the gender of the pronouns, several of Barnfield’s glowing sonnets might take their place at once in our anthologies. Before the publication of his volume, however, he had repented of his heresies, and had become enamoured of a “lass” named Eliza (or Elizabeth), whom he celebrates with effusion in an “Ode.” This is probably the lady whom he presently married, and as we find him a grandfather in 1636 it is unlikely that the wedding was long delayed. In 1598 Barnfield published his third volume, The Encomium of Lady Pecunia, a poem in praise of money, followed by a sort of continuation, in the same six-line stanza, called “The Complaint of Poetry for the Death of Liberty.” In this volume there is already a decline in poetic quality. In the Appendix of “Poems written during the winter of 1599” the volume presents some very interesting features. Here appears what seems to be the absolutely earliest praise of Shakespeare in a piece entitled “A Remembrance of some English Poets,” in which the still unrecognized author of Venus and Adonis is celebrated by the side of Spenser, Daniel and Drayton. Here also are the sonnet, “If Music and sweet Poetry agree,” and the beautiful ode beginning “As it fell upon a day,” which were until recently attributed to Shakespeare himself. In the next year, 1599, The Passionate Pilgrim was published, with the words “By W. Shakespeare” on the title-page. It was long supposed that this attribution was correct, but Barnfield claimed one of the two pieces just mentioned, not only in 1598, but again in 1608. It is certain that both are his, and possibly other things in The Passionate Pilgrim also; Shakespeare’s name is in the twenty poems of that miscellany being doubtless confined to the five short pieces which have been definitely identified as his. In the opinion of the present writer the sonnet beginning “Sweet Cythera” has unmistakably the stamp of Barnfield, and is probably a gloss on the first rapturous perusal of Venus and Adonis; the same is to be said of “Scarce had the sun,” which is out Barnfield, aut diabolus. One or two other contributions to The Passionate Pilgrim may be conjectured, with less confidence, to be Barnfield’s. It has been stated that the poet was now studying the law at Gray’s Inn, but for this the writer is unable to discover the authority, except that several members of that society are mentioned in the course of the volume of 1598. In all probability Barnfield now married and withdrew to his estate of Dorestone (or Darfaston), in the county of Stafford, a house romantically situated on the river Trent, where he henceforth resided as a country gentleman. In 1605 he reprinted his Lady Pecunia, and this was his latest appearance as a man of letters. His son Robert Barnfield and his cousin Elinor Smyrns were his executors when his will was proved at Lichfield; his wife then, at the absurdly premature death he died at Dorestone Hall, and was buried in the neighbouring parish church of St Michael’s, Stone, on the 6th of March 1627. The labours of Dr Grosart and of Professor Arber have thrown much light on the circumstances of Barnfield’s career. He has taken of late years a far more prominent place than ever before in the history of English literature. This is due partly to the remarkable merit of his graceful, melodious and highly-coloured verse, which was practically unknown until it was privately printed in 1876 (ed. Grosart, Roxburghe Club), and at length given to the public in 1882 (ed. Arber, English Scholars’ Library). It is also due to the mysterious personal relation of Barnfield to Shakespeare, a relation not easy to prove in detail, as it is built up on a great variety of small indications. It is, however, obvious that Barnfield warmly admired Shakespeare, whose earliest imitator he may be said to have been, and that between 1595 and 1600 the younger poet was so close to the elder that the compositions of the former could be confused with those of the latter. Barnfield died, as a poet, in his twenty-fifth year. Up to that time he had displayed a talent which, if he had pursued it, might have placed him among the first of his age. The collection of verses which has now interest to a certain number of readers as being, in his language “Italianate” way, a sort of ineffectual Meleager in the rich Elizabethan anthologies.

Besides the editions already cited, The Affectionate Shepherd was edited by Mr J. O. Halliwell-Phillipps for the Percy Society (Early English Poetry, vol. xx.); The Encomium of Pecunia and some other poems by J. Bowell (Roxburghe Club, 1816); and by J. P. Collier in Illustrations of Old English Literature (vol. i., 1866). (E.G.)

BARNIM, the name of a district between the Spree, the Oder and the Havel, which was added to the mark of Brandenburg during the 13th century. In the 15th century it was divided into upper and lower Barnim, and these names are now borne by two circles (Kreise) in the kingdom of Prussia.

BARNIM, the name of thirteen dukes who ruled over various divisions of the duchy of Pomerania. The following are the most important:

Barnim I. (c. 1209–1278), called the Good, was the son of Bogislau II., duke of Pomerania-Stettin, and succeeded to this duchy on his father’s death in 1220. After he became of age he endeavoured to make a struggle with external enemies, and in 1230 was compelled to recognize the supremacy of the margrave of Brandenburg. Having in 1264 united the whole of Pomerania under his rule, Barnim devoted his energies to improving its internal condition. He introduced German settlers and customs into the duchy, founded many towns, and was extremely generous towards ecclesiastical foundations. He died on the 13th or 14th of November 1278.

Barnim III. (c. 1303–1368), called the Great, was the son of Otto I., duke of Pomerania-Stettin, and took a prominent part in the defence and government of the duchy before his father’s
death in 1344. A long and intermittent struggle with the representatives of the emperor Louis IV., who had invested his own son Louis with the mark of Brandenburg, enabled him to gain military experience and distinction. A victory gained by him in August 1351 was mainly instrumental in freeing Pomerania from the vexatious claim of Brandenburg to supremacy over the duchy, which moreover he extended by conquest. Barnim assisted the emperor Charles IV. in his struggle with the family of Wittelsbach. He died on the 24th of August 1368.

**BARNIM** XI. (1501-1573), son of Bogislaus X., duke of Pomerania, became duke on his father's death in 1523. He ruled for a time in common with his elder brother George; and after George's death in 1531 he shared the duchy with his nephew Philip I., retaining for himself the duchy of Pomerania-Stettin. The earlier years of his rule were troubled by a quarrel with the margrave of Brandenburg, who wished to annex Pomerania. In 1539, however, a treaty was made which freed Pomerania from the supremacy of Brandenburg on condition that if the ducal family became extinct the duchy should revert to Brandenburg. Barnim adopted the doctrines of Martin Luther, and joined the league of Schmalkalden, but took no part in the subsequent war. But as this attitude left him without supporters he was obliged to submit to the emperor Charles V., to pay a heavy fine, and to accept the *Interim*, issued by the emperor in May 1555. In 1559 Barnim handed over his duchy to his grand-nephew, John Frederick, and died at Stettin on the 2nd of June 1573.

**BARNSTAPLE** (or properly BLaek BARNStALE), a market town and municipal borough in the Barnsley parliamentary division of the West Riding of Yorkshire, England, 15 m. N. of Sheffield. Pop. (1801) 35,427; (1901) 41,086. It is served by the Midland, Great Central, Lancashire & Yorkshire, Great Northern, and Hull & Barnsley railways. It is in the parish of Silkstone, which gives name to important collieries. It is situated on rising ground west of the river Dearne, and, though it lies in attraction owing to its numerous factories, its neighbourhood has considerable natural beauty. Among the principal buildings and institutions are several churches, of which the oldest, the parish church of St. Mary, was built in 1821 on an early site; court house, public hall, institute and free library. Among several educational institutions, the free grammar school dates from 1665; and a philosophical society was founded in 1828. A monument was erected in 1895 to prominent members of the Yorkshire Mining Region, and a memorial park was opened in 1897 by the widow of Joseph Locke, M.P. The manufacture of iron and steel, and the weaving of linen and other cloth, are the two principal industries; but there are also bleachfields, printfinders, dyeworks, sawmills, cornmills and malt-houses; and the manufacture of glass, needles and wire is carried on. There are large coalfields in the neighbourhood, which, indeed, extend under the town. Coal and coke are largely exported to London and Hull. In the vicinity, Monk Bretton Priory, a Cluniac foundation of 1157, retains a Perpendicular gatehouse, some Decorated domestic remains, and fragments of the church. Wentworth Castle, built in 1730 by Thomas, earl of Strafford, stands in a singularly beautiful park, and contains a fine collection of portraits of historical interest. Besides the communications afforded by railway, Barnsley has the advantage of connexion with the Aire and Calder Navigation system of canals. The borough is under a mayor, six aldermen and eighteen councillors. Area, 2,236 acres.

**BARNSTAPLE** (Berdekstaple, Barstapole, or Barum) ranks among the most ancient of royal boroughs. As early as Domesday, where it is several times mentioned, there were forty burgesses within the town and nine without, who rendered 40s. Tradition claims that King Athelstan threw up defensive earthworks here, but the existing castle is attributed to Joel of Totnes, who held the manor during the reign of William the Conqueror, and also founded a Cluniac priory, dedicated to St. Mary Magdalen. From this date the borough and priory grew up side by side, but each continued to maintain its independent privileges and rights of government until the dissolution of the latter in 1535. In Edward II.'s reign the burgesses petitioned for the restoration of rights bestowed by a pretended charter from Athelstan. The existence of this charter was denied, but the desired privileges were conceded, including the right to elect a mayor. The earliest authenticated charter is that of Henry I., which was confirmed in a charter of Henry II. The later charter states that the burgesses should have customs similar to those granted to London, and further charters confirmed the same right. A charter of Queen Mary in 1556 added some new privileges, and specified that the common council should consist of a mayor, two aldermen,
and twenty-four chief burgesses. James I., by a charter dated 1616, increased the number of chief burgesses to twenty-five and instituted a recorder, a clerk of the market, justices of the peace and other officers. This charter was confirmed in 1617 and 1680, and held force until the Municipal Corporations Act of 1835, which established six aldermen and eighteen councillors. The borough sent two members to parliament in 1295, and so continued to do until the Redistribution of Seats Act of 1885, when the representation was merged in that of the county. Barnstaple was once famous for its woolen trade, now entirely declined, and as early as the reign of Edward III. was an important naval port, with an extensive shipping trade. That this prosperity was not altogether uninterrupted is testified by the fact that, at the time of the Armada, the mayor pleased inability to contribute three ships, on account of injuries to trade consequent on the war with Spain. The Friday market and the annual four days' fair in September are held by immemorial prescription.

See J. B. Gribble, Memorials of Barnstaple (Barnstaple, 1830).

Barnum, Phineas Taylor (1814–1883), American showman, was born in Bethel, Connecticut, on the 7th of July 1814, his father being an inn- and store-keeper. Barnum first started as a show-keeper, and was also concerned in the lottery mania then prevailing in the United States. After failing in business, he started in 1829 a weekly paper, The Herald of Freedom, in Danbury; after several libel suits and a prosecution which resulted in imprisonment, he moved to New York in 1834, and in 1835 began his career as a showman, with his purchase and exploitation of a coloured woman, Joyce Heth, reputed to have been the nurse of George Washington, and to be over a hundred and sixty years old. With this woman and a small company he made well-advertised and successful tours in America till 1839, though Joyce Heth died in 1836, when her age was proved to be not more than seventy. After a period of failure, he purchased Scudder's American Museum, New York, in 1842; but he continued considerably, and it became one of the most popular shows in the United States. He made a special hit by the exhibition, in 1842, of Charles Stratton, the celebrated "General Tom Thumb" (see Dwarf). In 1844 Barnum toured with the dwarf in England. A remarkable instance of his enterprise was the engagement of Jenny Lind to sing in America at $1000 a night for one hundred and fifty nights, all expenses being paid by the entrepreneur. The tour began in 1840. Barnum retired from the show business in 1855, but had to settle with his creditors in 1857, and began his old career again as showman and museum proprietor. In 1871 he established the "Greatest Show on Earth," a travelling amalgamation of circus, menagerie and museum of "freaks," &c. This show, incorporates in the name of "Barnum, Bailey & Hutchinson," and later as "Barnum & Bailey's" toured all over the world. In 1870 the business was sold to Ringling Brothers. Barnum wrote several books, such as The Humble of the World (1865), Struggles and Triumphs (1869), and his Autobiography (1854, and later editions). He died on the 7th of April 1891.

Barocchio (or Barozzi), Giacomo, called Da Vignola (1507–1573). Italian architect, was born at Vignola in the Modenese territory on the 1st of October 1507. His early work was conducted at Bologna, Piacenza, Assisi and Perugia, until he was summoned to Rome as papal architect under Pope Julius III. In 1564 he succeeded Michelangelo as the architect of St Peter's, and executed various portions of that fabric, besides a variety of works in Rome. The designs for the Escorial were also supplied by him. He is the author of an excellent work on the Five Orders of Architecture (Rome, 1563), and another work on Practical Perspective (Rome, 1583). To his extensive acquirements and exquisite taste were superadded an amenity of manners and a noble generosity that won the affection and admiration of all who knew him. He died in Rome on the 7th of July 1573. He was an eminent upholsterer of the classic style at a period when the style known as baroque was corrupting the architecture of Italy. The term baroque owes its origin to the Spanish word barroque or berrueco, an imperfectly round pearl, and is not derived from the architect Barocchio, whose name so much resembles it. Yet it is curious that it was much used to describe a debased form of architecture encouraged by the Jesuits whose church in Rome was built by Barocchio.

Barocci (or Barocchio), Federigo (1528–1612), Italian painter, was born at Urbino, where the genius of Raphael inspired him. In his early youth he travelled to Rome, where he painted in fresco and was warmly commended by Michelangelo. He then returned to Urbino, where, with the exception of some short visits to Rome, he continued to reside till his death. He acquired great fame by his paintings of religious subjects, in the style of which he to some extent imitated Correggio. His own followers were very numerous, but according to Lanzi (Hist. of Painting) carried their master's peculiarities to excess. Barocci also etched from his own designs a few prints, which are highly finished, and executed with great softness and delicacy.

Baroda, a native state of India, within the Gujarat province of Bombay, but in direct relations with the governor-general. It consists of four isolated divisions, each of which is interlaced in the most intricate fashion with British territory or with other native states. Three of these divisions—Kadi, Baroda and Nausari—are in Gujarat proper; the fourth, Amreli with Okhamandal, is in the peninsula of Kathiawar. The total area covers 800 sq. m. In 1901 the population was 1,557,602, with a decrease of 10% in the decade, compared with an increase of 8% in the preceding decade. This decrease was due partly to the famines of 1869–1870 and 1900–1901, partly to the epidemics of cholera and fever which accompanied them, and partly to the plague which attacked the state in such great measure as the surrounding presidency.

The princes of Baroda were one of the chief branches of the Maharatta confederacy, which in the 18th century spread devastation and terror over India. About 1721 one Pirajj Gaekwar carved a fertile slice of territory out of Gujarat, and afterwards received the title of "Leader of the Royal Troops" from the peshwa. During the last thirty-two years of the century he fell a prey to a host of unappeasable and furious factions which are the ruin of great Indian families. In 1800 the inheritance descended to a prince feeble in body and almost idiotic in mind. British troops were sent in defence of the hereditary ruler against all claimants; a treaty was signed in 1802, by which his independence of the peshwa and his dependence on British government were secured. Three years later these and various other engagements were consolidated into a systematic plan for the administration of the Baroda territory, under a prince with a revenue of three-quarters of a million sterling, perfectly independent in all internal matters, but practically kept on his throne by subsidary British troops. For some time the history of the gaekwars was very much the same as that of most territorial houses in India: an occasional able minister, more rarely an able prince; but, on the other hand, a long dreary list of incompetent heads, venal advisers and taskmasters oppressive to the people. At last a fierce family feud came to a climax. In 1873 an English commission of inquiry was appointed to investigate various complaints of oppression against the gaekwar, Malhar Rao, who had recently succeeded to the throne after being for a long time kept in prison by his brother, the former gaekwar. No real reform resulted, and in 1876 an attempt at poisoning the British resident led to the gaekwar being formally accused of the crime and tried by a mixed commission. The result of the trial (1875) was a failure to obtain a unanimous verdict on the charge of poisoning; the viceroy, Lord Northbrook, however, decided to depose Malhar Rao on the ground of gross misgovernment, the widow of his brother and predecessor, Khande Rao, being permitted to adopt an heir from among the descendants of the founder of the family. This heir, by name Sayaji Rao, then a boy of twelve years in the humble home of a Deccan cultivator, was educated by an English tutor, the administration being meanwhile placed for eight years under the charge of Sir T. Madhava Rao, formerly a dinner of Travancore, one of the ablest and most enlightened of Indian statesmen. The result was a conspicuous success. The gaekwar showed himself a model prince, and his territories
became as well governed and prosperous as a British district. He repeatedly visited Europe in company with his wife. In 1889 the queen-empress conferred upon him at Windsor the insignia of G.C.S.I., and in 1892 upon his wife the Imperial order of the crown of India.

The gross revenue of the state is more than a million sterling. In 1901 the state currency of Babashai rupees was withdrawn, and the British rupee was introduced. The regular military force consists of a field battery, with several regiments of cavalry and battalions of infantry. In addition, there is an irregular force of horse and foot. Compulsory education has been carried on experimentally since 1863 in the Amreli division with apparent success, the compulsory age being 7 to 12 for boys and 7 to 10 for girls. Special measures are also adopted for the education of low castes and aboriginal tribes. There is a female training college under a Christian lady superintendent. The Kala Bhavan, or technical school, has departments for drawing, carpentry, dyeing, weaving and agriculture. There is also a state museum under a European director, and a state library. Portions of the state are crossed by the Bombay & Baroda and the Rajputana railways. In addition, the state has constructed three railways of its own, on three different gauges. Other railways are in contemplation. The state possesses a cotton mill.

The city of Baroda is situated on the river Viswamitri, a station on the Bombay & Baroda railway, 245 m. N. of Bombay by rail. Pop. (1901) 103,790. The whole aspect of the city has been changed by the construction of handsome public buildings, the laying-out of parks and the widening of the streets. An excellent water-supply is provided from the Ajwa lake. The cantonments, garrisoned by a native infantry regiment, are under British jurisdiction, and have a population of 4000. The city contains a college and many schools. The chief hospitals are called after the counts of Dufferin, Sayaji Rao and Jamnabai, the widow of Khande Rao.

See Baroda.

BAROMETER (from Gr. βαρός, pressure, and μέτρον, measure), an instrument by which the weight or pressure of the atmosphere is measured. The ordinary or mercurial barometer consists of a tube about 36 in. long, hermetically closed at the upper end and containing mercury. In the "cistern barometer" the tube is placed with its open end in a basin of mercury, and the atmospheric pressure is measured by the difference of the heights of the mercury in the tube and the cistern. In the "siphon barometer" the cistern is dispensed with, the tube being bent round upon itself at its lower end; the reading is taken of the difference in the levels of the mercury in the two limbs. The "aneroid" barometer (from the Gr. α- privative, and μέτρον, wet) employs no liquid, but depends upon the changes in volume experienced by an exhausted metallic chamber under varying pressures. "Baroscopes" simply indicate variations in the atmospheric pressure, without supplying quantitative data. "Barographs" are barometers which automatically record any variation in pressure.

Philosophers prior to Galileo had endeavoured to explain the action of a suction pump by postulating a principle that "Nature abhorred a vacuum." When Galileo observed that a common suction pump could not raise water to a greater height than about 32 ft. he considered that the "abhorrence" was limited to 32 ft., and commended the matter to the attention of his pupil Evangelista Torricelli. Torricelli perceived a ready explanation of the observed phenomenon if only it could be proved that the atmosphere had weight, and the pressure which it exerted was equal to that of a 32-ft. column of water. He proved this to be the correct explanation by reasoning as follows:—If the atmosphere supports 32 feet of water, then it should also support a column of just 32 ft. of mercury, for this liquid is about 33.5 times heavier than water. This he proved in the following manner: he selected a glass tube about a quarter of an inch in diameter and 4 ft. long, and hermetically sealed one of its ends; he then filled it with mercury and, applying his finger to the open end, inverted it in a basin containing mercury. The mercury instantly sank to nearly 30 in. above the surface of the mercury in the basin, leaving in the top of the tube an apparent vacuum, which is now called the "Torricellian vacuum;" this experiment is sometimes known as the "Torricellian experiment.

Torricelli's views rapidly gained ground, notwithstanding the objections of certain philosophers. Valuable confirmation was afforded by the variation of the barometric column at different elevations. René Descartes and Blaise Pascal predicted a fall in the height when the barometer was carried to the top of a mountain, since, the pressure of the atmosphere being diminished, it necessarily followed that the column of mercury sustained by the atmosphere would be diminished also. This was experimentally observed by Pascal's brother-in-law, Florin Périer (1605-1672), who measured the height of the mercury column at various altitudes on the Puy de Dôme. Pascal himself tried the experiment at several towers in Paris,—Notre Dame, St Jacques de la Boucherie, &c. The results of his researches were embodied in his treatises De l'équilibre des liquides and De la pesanteur de la masse d'air, which were written before 1651, but were not published till 1653 after his death. Corroboration was also afforded by Martin Mersenne and Christian Huygens. It was not long before it was discovered that the height of the column varied at the same place, and that: a rise or fall was accompanied by meteorological changes. The instrument thus came to be used as a means of predicting the weather, and it was frequently known as the "weather-glass." The relation of the barometric pressure to the weather is mentioned by Robert Boyle, who expressed the opinion that it is exceedingly difficult to draw any correct conclusions. Edmund Halley, Leibnitz, Jean André Deluc (1727-1817) and many others investigated this subject, giving rules for predicting the weather and attempting explanations for the phenomena. Since the height of the barometric column varies with the elevation of the station at which it is observed, it follows that observations of the barometer afford a means for measuring altitudes. The early experiments of Pascal were developed by Edmund Halley, Edme Mariotte, J. Cassini, D. Bernoulli, and more especially by Deluc in his Recherches sur les modifications de l'atmosphère (1772), which contains a full account of the early history of the barometer and its applications. More highly mathematical investigations have been given by Laplace, and also by Richard Rühlmann (Barometrischen Höhenmessung, Leipzig, 1870). The modern aspects of the relation between atmospheric pressure and the weather and altitudes are treated in the article METEOROLOGY.

Many attempts have been made by which the variation in the height of the mercury column could be magnified, and so more exact measurements taken. It is not possible to enumerate in this article the many devices which have been proposed; and the reader is referred to Charles Hutton's Mathematical and Philosophical Dictionary (1815), William Ellis's paper on the history of the barometer in the Quarterly Journal of the Royal Meteorological Society, vol. xii. (1886), and E. Gerland and F. v. Döbel's Geschichte der physikalischen Experimentierkunst (1809). Descartes suggested a method which Huygens put into practice. The barometer tube was expanded into a cylindrical vessel at the top, and into this chamber a fine tube partly filled with water was inserted. A slight motion of the mercury occasioned a larger displacement of the water, and hence the changes in the barometric pressure were more readily detected and estimated. But the instrument failed as all water-barometers do, for the gases dissolved in the water coupled with its high vapour tension destroy its efficacy. The substitution of methyl salicylate for the water has been attended with success. Its low vapour tension (Sir William Ramsay and Sydney Young give no value below 70° C.), its low specific gravity (1-18 at 10° C.), its freedom from viscosity, have contributed to its successful use. In the form patented by C. O. Bartram it is claimed that readings to 0-001 of an inch of mercury can be taken without difficulty.

The diagonal barometer, in which the upper part of the tube is inclined to the lower part, was suggested by Bernardo Ramazzini (1633-1714), and also by Sir Samuel Morland (or Moreland). This form has many defects, and even when the
tube is bent through 45° the readings are only increased in the ratio of 7 to 5. The wheel barometer of Dr R. Hooke, and the steel-yard barometer, endeavour to magnify the oscillation of the mercury column by means of a float resting on its surface. The motion of the float, due to any alteration in the level of the mercury being rendered apparent by a change in the position of the wheel or steel-yard. The pendant barometer of G. Amontons, invented in 1695, consists of a funnel-shaped tube, which is hung vertically with the wide end downwards and closed in at the upper end. The tube contains mercury which adjusts itself in the tube so that the length of the column balances the atmospheric pressure. The instability of this instrument is obvious, for any jar would cause the mercury to leave the tube.

The Siphon Barometer (fig. 1) consists of a tube bent in the form of a siphon, and is of the same diameter throughout. A graduated scale passes along the whole length of the tube, and the height of the barometer is ascertained by taking the difference of the readings of the upper and lower limbs respectively. This instrument may also be read by bringing the zero-point of the graduated scale to the level of the surface of the lower limb by means of a screw, and reading off the height at once from the surface of the upper limb. This barometer requires no correction for errors of capillarity or capacity. Since, however, impurities are contracted by the mercury in the lower limb, which is usually in open contact with the air, the satisfactory working of the instrument comes soon to be seriously interfered with.

Fig. 2 shows the Cistern Barometer in its essential and simplest form. This barometer is subject to two kinds of error, one arising from capillarity, and the other from changes in the level of the surface of the cistern as the mercury rises and falls in the tube; the latter being technically called the error of capacity. If a glass tube of small bore be plunged into a vessel containing mercury, it will be observed that the level of the mercury in the tube is not in the line of that of the mercury in the vessel, but somewhat below it, and that the surface is convex. The capillary depression is inversely proportional to the diameter of the tube. In standard barometers, the tube is about an inch in diameter, and the error due to capillarity is less than 1/100 of an inch. Since capillarity depresses the height of the column, cistern barometers require an addition to be made to the observed height, in order to give the true pressure, the amount depending, of course, on the diameter of the tube.

The error of capacity arises in this way. The height of the barometer is the perpendicular distance between the surface of the mercury in the cistern and the upper surface of the mercurial column. Now, when the barometer falls from 30 to 29 inches, an inch of mercury must flow out of the tube and pass into the cistern, thus raising the cistern level; and, on the other hand, when the barometer rises, mercury must flow out of the cistern into the tube, thus lowering the level of the mercury in the cistern. Since the scales of barometers are usually engraved on their brass cases, which are fixed (and, consequently, the zero-point from which the scale is graduated is also fixed), it follows that, from the incessant changes in the level of the cistern, the readings would be sometimes too high and sometimes too low, if no provision were made against this source of error.

A simple way of correcting the error of capacity is—to ascertain (1) the neutral point of the instrument, or that height at which the zero of the scale is exactly at the height of the surface of the cistern, and (2) the rate of error as the barometer rises or falls above this point, and then apply a correction proportional to this rate. The instrument in which the error of capacity is satisfactorily (indeed, entirely) got rid of is Fortin's Barometer. Fig. 3 shows how this is effected. The upper part of the cistern is a glass cylinder, through which the level of the mercury may be seen. The bottom is made like a bag, of flexible leather, against which a screw works. At the top of the interior of the cistern is a small piece of ivory, the point of which coincides with the zero of the scale. By means of the screw, which acts on the flexible cistern bottom, the level of the mercury can be raised or depressed so as to bring the ivory point exactly to the surface of the mercury in the cistern. In some barometers the cistern is fixed, and the ivory point is brought to the level of the mercury in the cistern by raising or depressing the scale.

In constructing the best barometers three materials are employed, viz.:(1) brass, for the case, on which the scale is engraved; (2) glass, for the tube containing the mercury; and (3) the mercury itself. It is evident that if the coefficient of expansion of mercury and brass were the same, the height of the mercury as indicated by the brass scale would be the true height of the mercurial column. But this is not the case, the coefficient of expansion for mercury being considerably greater than that for brass. The result is that if a barometer stand at 30 in. when the temperature of the whole instrument, mercury and brass, is 32°, it will no longer stand at 30 in. if the temperature be raised to 60°; in fact, it will then stand at 30-1 in. This increase in the height of the column by the tenth of an inch is not due to any increase of pressure, but altogether to the greater expansion of the mercury at the higher temperature, as compared with the expansion of the brass case with the engraved scale by which the height is measured. In order, therefore, to compare with each other with exactness barometric observations made at different temperatures, it is necessary to reduce them to the heights at which they would stand at some uniform temperature. The temperature to which such observations are reduced is 32° Fahr. or 0° cent.

If English units be used (Fahrenheit degrees and inches), this correction is given by the formula \( x = H \frac{207}{100} - 2.6 \); in the centigrade-centimetre system the correction is \( \frac{-0.000164}{H} \) (H being the observed height and T the observed temperature). Devices have been invented which determine these corrections mechanically, and hence obviate the necessity of applying the above formula, or of referring to tables in which these corrections for any height of the column and any temperature are given.

The standard temperature of the English yard being 63° and not 32°, it will be found in working out the corrections from the above formula that the temperature of no correction is not 32° but 28-5°. If the scale be engraved on the glass tube, or if the instrument be furnished with a glass scale or with a wooden scale, different corrections are required. These may be worked out from the above formula by substituting for the coefficient of the expansion of brass that of glass, which is assumed to be 1000000, or that of wood, which is assumed to be 0. Wood, however, should not be used, its expansion with temperature being unstable, as well as uncertain.

If the brass scale be attached to a wooden frame and be free to move up and down the frame, as is the case with many siphon barometers, the corrections for brass scales are to be used, since the zero-point of the scale is brought to the level of the lower limb; but if the brass scale be fixed to a wooden frame, the corrections for brass scales are only applicable provided the zero of the scale be fixed at (or nearly at) the zero line of the column, and be free to expand upwards. In siphon barometers, with which an observation is made from two readings on the scale, the
scale must be free to expand in one direction. Again, if only the upper part of the scale, say from 27 to 31 in., be screwed to a wooden frame, it is evident that not the corrections for brass scales, but those for wooden scales must be used. No account need be taken of the expansion of the glass tube containing the mercury, it being evident that no correction for this expansion is required in the case of any barometer the height of which is measured from the surface of the mercury in the cistern.

In fixing a barometer for observation, it is indispensable that it be hung in a perpendicular position, seeing that it is the perpendicular distance between the surface of the mercury in the cistern and the top of the column which is the true height of the barometer. The surface of the mercury column is convex, and in noting the height of the barometer, it is not the chord of the curve, but its tangent which is taken. This is done by setting the straight lower edge of the vernier, an appendage with which the barometer is furnished, as a tangent to the curve. The vernier is made to slide up and down the scale, and by it the height of the barometer may be read true to 0.001 or even to 0.0001 in.

It is essential that the barometer is at the temperature shown by the attached thermometer. No observation can be regarded as good if the thermometer indicates a temperature differing from that of the whole instrument by more than a degree. For every degree of temperature the attached thermometer differs from the barometer, the observation will be faulty to the extent of about 0.003 in., which in discussions of diurnal range, &c., is a serious amount.

Before being used, barometers should be thoroughly examined as to the state of the mercury, the size of cistern (so as to admit of low readings), and their agreement with some known standard instrument at different points of the scale. The pressure of the atmosphere is not expressed by the weight of the mercury sustained in the tube by it, but by the perpendicular height of the column. Thus, when the height of the column is 30 in., it is not said that the atmospheric pressure is 14.7 lb on the square inch, or the weight of the mercury filling a tube at that height where the transverse section equals a square inch, but that it is 30 in., meaning that the pressure will sustain a column of mercury of that height.

It is essential in gasometry to fix upon some standard pressure to which all measurements can be reduced. The height of the standard mercury column commonly used is 76 cms. (29.222 in.) of pure mercury at 0°; this is near the average height of the barometer. Since the actual force exerted by the atmosphere varies with the intensity of gravity, and therefore with the position on the earth's surface, a place must be specified in defining the standard pressure. This may be avoided by expressing the force as the pressure in dynes due to a column of mercury, one square centimetre in section, which is supported by the atmosphere. If H cms. be the height at 0°, and g the value of gravity, the pressure is 13.596 Hg dynes (13.596 being the density of mercury). At Greenwich, where g = 981.17, the standard pressure at 0° is 1013.250 dynes. At Paris the pressure is 1033.600 dynes. The closeness of this unit to a mega-dyne (a million dynes) has led to the suggestion that a mega-dyne per square centimetre should be adopted as the standard pressure, and it has been adopted by some modern writers on account of its convenience of calculation and independence of locality.

The height of the barometer is expressed in English inches in England and America, but the metric system is used in all scientific work excepting in meteorology. In France and most European countries, the height is given in millimetres, a millimetre being the thousandth part of a metre, which equals 39.37079 English inches. Up to 1860 the barometer was given in half-lines in Russia, which, equalling the twentieth of an English inch, were readily reduced to English inches by dividing by 20. The metric barometric scale is now used in Russia. In a few European countries the French or Paris line, equalling 0.088814 in., is sometimes used. The English measure of length being a standard at 62°, the French measure at 61°2, and the metric scale at 32°, it is necessary, before comparing observations made with the three barometers, to reduce them to the same temperature, so as to neutralize the inequalities arising from the expansion of the scales by heat.

The sympieometer was invented in 1818 by Adie of Edinburgh. It is a revived form of Hooke's marine barometer. It consists of a glass tube, with a small chamber at the top and an open cistern below. The upper part of the tube is filled with air, and the lower part and cistern with glycerin. When atmospheric pressure is increased, the air is compressed by the rising of the fluid; but when it is diminished the fluid falls, and the contained air expands. To correct for the error arising from the increased pressure of the contained air when its temperature varies, a thermometer and sliding-scale are added, so that the instrument may be adjusted to the temperature at each observation. It is a sensitive instrument, and well suited for rough purposes at sea and for travelling, but not for exact observation. It has long been superseded by the Aneroid, which far exceeds it in handiness.

Aneroid Barometer.—Much obscurity surrounds the invention of barometers in which variations in pressure are rendered apparent by the alteration in the volume of an elastic chamber. The credit of the invention is usually given to Lucien Vidie, who patented his instrument in 1845, but similar instruments were in use much earlier. Thus in 1799 Nicolas Jacques Conté (1755-1805), director of the aerostatical school at Meudon, and a man of many parts—a chemist, mechanician and painter,—designed an instrument in which the lid of the metal chamber was supported by internal springs; this instrument was employed during the Egyptian campaign for measuring the altitudes of the war-balloons. Although Vidie patented his device in 1845, the commercial manufacture of aneroids only followed after E. Bourdon's patent of the metallic manometer in 1849, when Bourdon and Richard placed about 10,000 aneroids on the market. The production was stopped by an action taken by Vidie against Bourdon for infringing the former's patent, and in 1858 Vidie obtained 25,000 francs (£1,000) damages.

Fig. 4 represents the internal construction, as seen when the face is removed, but with the hand still attached, of an aneroid which differs only slightly from Vidie's form. a is a flat circular metallic box, having its upper and lower surfaces corrugated in concentric circles. This box or chamber being partially exhausted of air, through the short tube b, which is subsequently made air-tight by soldering, constitutes a spring, which is affected by every variation of pressure in the external atmosphere, the corrugations on its surface increasing its elasticity. At the centre of the upper surface of the exhausted chamber there is a solid cylindrical projection x, to the top of which the principal lever cde is attached. This lever rests partly on a spiral spring at d; it is also supported by two vertical pins, with perfect freedom of motion. The end e of the lever is attached to a second or small lever f, from which a chain g extends to k, where it works on a drum attached to the axis of the hand, connected with a hair spring at h, changing the motion from vertical to horizontal, and regulating the hand, the attachments of which are made to the metallic plate i. The motion originates in the corrugated elastic box a, the surface of which is depressed or elevated as the weight of the atmosphere is increased or diminished, and this motion is communicated through the levers to the axis of
the hand at h. The spiral spring on which the lever rests at d is intended to compensate for the effects of alterations of temperature. The actual movement at the centre of the exhausted box, whence the indications emanate, is very slight, but by the action of the levers is multiplied 657 times at the point of the hand, so that a movement of the 220th part of an inch in the box carries the point of the hand through three inches on the dial. The effect of this combination is to multiply the smallest degrees of atmospheric pressure, so as to render them sensible on the index. Vidie's instrument has been improved by Vaudet and Hulot. Eugène Bourdon's aneroid depends on the same principle. The aneroid requires, however, to be repeatedly compared with a mercurial barometer, being liable to changes from the elasticity of the metal chamber changing, or from changes in the system of levers which work the pointer. Though aneroids are constructed showing great accuracy in their indications, yet none can lay any claim to the exactness of mercurial barometers. The mechanism is liable to get clogged and otherwise go out of order, so that they may change 0-300 in. in a few weeks, or even indicate pressure so inaccurately and so irregularly that no confidence can be placed in them for even a few days, if the means of comparing them with a mercurial barometer be not at hand.

The mercurial barometer can be made self-registering by concentrating the rays from a source of light by a lens, so that they strike the top of the mercurial column, and having a sheet of sensitized paper attached to a frame and placed behind a screen, with a narrow vertical slit in the line of the rays. The mercury being opaque throws a part of the paper in the shade, while above the mercury the rays from the lamp pass uninstructed to the paper. The paper being carried steadily round on a drum at a given rate per hour, the height of the column of mercury is photographed continuously on the paper. From the photograph the height of the barometer at any instant may be taken. The principle of the aneroid barometer has been applied to the construction of barographs. The lever attached to the collapsible chamber terminates in an ink-fed style which records the pressure of the atmosphere on a moving ribbon. In all continuously registering barometers, however, it is necessary, as a check, to make eye-observations with a mercury standard barometer hanging near the registering barometer from four to eight times daily.

See Marvin, Barometers and the Measurement of Atmospheric Pressure (1901); and C. Abbe, Meteorological Apparatus (1888). Reference should be made to G. W. W. G. Bee, Practical Physics (vol. i. 1901), for the construction of standard barometers, their corrections and method of reading.

BAROMETRIC LIGHT, the luminous glow emitted by mercury in a barometer tube when shaken. It was first observed by Jean Picard, and formed the subject of many experiments at the hands of Francis Hawksbee. The latter showed that the Torricellian vacuum was not essential to the phenomenon, for the same glow could be produced in a tube sealed with air only rarified. The glow is an effect of the electricity generated by the friction of the mercury and the air in the barometer tube.

BARON, MICHEL (1653–1729). French actor (whose family name originally was Boyron), was born in Paris, the son of a leading actor (d. 1635) and of a talented actress (d. 1662). At the age of twelve he joined the company of children known as the Petits Comédiens Dauphins, of which he was the brightest star. Molière was delighted with his talent, and with the king's permission secured him for his own company. In consequence of a misunderstanding with Molière's wife, the actor withdrew from the dramatist's company, but rejoined it in 1670, reappearing as Domitien in Cornelle's Tite et Bérénice, and in his Psyche. He remained in this company until Molière's death. He then became a member of the company at the Hôtel de Bourgogne, and from this time until his retirement in 1691 was undisputed master of the French stage, creating many of the leading roles in Racine's tragedies, besides those in many of his own comedies, L'Homme à bonnes fortunes (1686), and La Coquette (1687). He also wrote Les Émulements (1685), Le Débauché (1689), and translated and acted two plays of Terence. In 1720 Baron reappeared at the Palais Royal, and his activity on the stage was renewed in a multitude of parts. He died on the 22nd of December 1729.

His son ÉTIENNE MICHEL BARON (1676–1711) was also a fine actor, and left a son and two daughters who all played at the Comédie Française.

See George Monval, Un Comédien amateur d'art (1893); also the Abbé d'Allamial's Lettres à mylord XXX. sur Baron et la demoiselle Lecouerue, in F. G. J. S. Andrieux's Collection des mémoires sur l'art dramatique (1822).

BARON. This word, of uncertain origin, was introduced into England at the Conquest to denote "the man" (i.e. one who had done him "homage") of a great lord, and more especially of the king. All who held in "chief" (i.e. directly) of the king were alike barones regis, bound to perform a stipulated service, and members, in theory at least, of his council. Great nobles, whether ears or not, also spoke of their tenants as "barons," where lesser magnates spoke of "his" or "their" men (homines). This was especially the case in earldoms of a palatine character, such as those where the earl's barons were a well-recognized body, the Venables family, "barons of Kinderton," continuing in existence down to 1670. In the patinate of Durham also, the bishop had his barons, among whom the Hyltons of Hilton Castle were usually styled "Barons of Hilton" till extinct in 1746. Other families to whom the title was accorded, independently of peerage dignity and on somewhat uncertain grounds, were "the barons of Greystock," "the barons of Stafford," and the Cornwells, "barons of Burford." Fantome makes Henry II. speak of "mes barons de Lunders;" John's charter granting permission to elect a mayor speaks of "our barons of our city of London," and a London document even speaks of "the greater barons of the city." The aldermen seem to have been loosely deemed equivalent to barons and were actually assessed to the poll-tax as such under Richard II. In Ireland the palatine character of the greater baronships made them not uncommon (e.g. the barons of Galtrim, the barons of Slane, the barons of the Naas).

As all those who held direct of the crown by military service (for those held by "serjeanty" appear to have been classed apart), from earls downwards, were alike "barons," the great difference in their position and importance must have led, from an early date, to their being roughly divided into "greater" and "lesser" barons, and indeed, under Henry II., the Dialogus de Scaccario already distinguishes their holdings as "greater" or "lesser" baronies. Within a century of the Conquest, as we learn from Becket's case (1164), there arose the practice of sending to the greater barons a special summons to the council, while the lesser barons, it is stipulated in Magna Carta (1215), were to be summoned only through the sheriffs. Thus was introduced a definite distinction, which eventually had the effect of restricting to the greater barons the rights and privileges of peerage.

Since this position was connected with the tenure of land; in theory the baron's power was those who owned the lands of the king; in practice, they were those who so held a large amount of land. The great change in their status was effected when their presence in that council of the realm which became the House of Lords was determined by the issue of a writ of summons, dependent not on the tenure of land, but only on the king's will. Camden's statement that this change was made by Henry III. after the "Barons' War" was long and widely accepted, but it is now assigned, as by Stubbs, to Edward I., and the earliest writs accepted as creating hereditary baronies are those issued in his reign. It must not, however, be supposed that those who received such summons were as yet distinguished from commoners by any style or title. The only possible prefix at that time was Dominus (lord), which was regularly used by simple knights, and writs of summons were still issued to the lowest order of peers as knights (chevaliers) only. The style of baron was first made the title of Richard II. in 1387, when he created John de Beauchamp, by patent, Lord de Beauchamp and baron of Kidderminster, to make him "unum paritum et baronum regni nostri." But it was not till 1435 that the next "baron" was created, Sir John Cornwall being then made baron of Fanhope. In spite, however, of these innovations, the former
BARON

was only summoned to parliament by the style of “John Beauchamp of Kidderminster,” and the latter by that of “John Cornwall, knight.” Such creations became common under Henry VI., a transition period in peerage styles, but “Baron” could not evict “Sire,” “Chevalier” and “Dominus.” Patents of creation contained the formula “Lord A. (and) Baron B.,” but the grantee still styled himself “Lord” only, and it is an historically interesting fact that to this day a baron is addressed in correspondence, not by that style, but as “the Lord A.,” although all peers under the rank of Duke are spoken of as “lords,” while they are addressed in correspondence by their proper styles. To speak of “Baron A.” or “Baron B.” is an unintentional and quite recent practice. When a barony, however, is vested in a lady it is now the recognized custom to speak of her as baroness, e.g. Baroness Berkeley.

The solemn investiture of barons created by patent was performed by the king himself, by enrobing the peer in the scarlet “robe of estate” during the reading of the patent, and this form continued till 13 Jac. I., when the lawyers declared that the delivery of the letters patent without ceremony was sufficient. The letters patent express the limits of inheritance of the barony. The usual limit is to the grantee and heirs male of his body, occasionally, in default of male issue, to a collateral male relative (as in the case of Lord Bingham, 1830) or among the heirs-male (as in the case of Lord Basset, 1797, and Lord Burying, 1857) to the heirs-male of the father, and occasionally (as in the case of Lord Nelson, 1801) to the heirs-male of a sister. Sometimes also (as in the case of the barony of Rayleigh, 1821) the dignity is bestowed upon a lady with remainder to the heirs-male of her body. The coronation robes of a baron are the same as those of an earl, except that he has only two rows of spots on each shoulder; and, in like manner, his parliamentary robes have but two guards of white fur, with rows of gold lace; but in other respects they are the same as those of other peers. King Charles II. granted to the barons a coronet, having six large pearls set at equal distances on the chaplet. A baron’s cap is the same as a viscount’s. His style is “Right Honourable”; and he is addressed by the king or queen, “Right Trusty and Well-beloved.” His children are by courtesy entitled to the prefix “The Honourable.”

Barons of the Exchequer were formerly six judges (a chief baron and five puisne barons) to whom the administration of justice was committed in causes betwixt the king and his subjects relative to matters of revenue. Selden, in his Titles of Honour, conjectures that they were originally chosen among the barons of the Exchequer, the barons of the Exchequer being the barons of the Exchequer in the old French sense, viz., “those who knew how to weigh.” They were addressed by the word, “sire,” and hence their name; but it would probably be more exact to say that they were officers of a branch of the king’s Curia, which was theoretically composed of his “barons.” The title has become obsolete since 1875, when the court of exchequer was merged in the High Court of Judicature.

Barons of the Cinque Ports (originally Hastings, Dover, Hythe, Romney and Sandwich) were at first the whole body of their freemen, who were so spoken of in royal charters. But the style was afterwards restricted to their mayors, jurats, and (prior to 1831) members of the House of Commons elected by the Cinque Ports, two for each port. Their right to the title is recognized in many old statutes, but in 1606 the use of the term in a message from the Lower House drew forth a protest from the peers, that “they would never acknowledge any man that sitteth in the Lower House to the right or title of a baron of parliament” (Lords’ Journals). It was the ancient privilege of these “barons” to bear a canopy over the sovereign at his or her coronation and retain it as their perquisite. They petitioned as “barons of the Cinque Ports” to attend the coronation of Edward VII., and a deputation was allowed to do so.

Baron and Feme, in English law, is a phrase used for husband and wife, in relation to each other, who are accounted as one person. Hence, by the old law of evidence, the one party was excluded from giving evidence for or against the other in civil questions, and a relic of this is still preserved in the criminal law.

Baron and Feme, in heraldry, is the term used when the coats-of-arms of a man and his wife are borne per pale in the same escutcheon, the man’s being always on the dexter side, and the woman’s on the sinister. But in this case the woman is supposed not to be an heiress, for then her coat must be borne by the husband on an escutcheon of pretence. (See Heraldry.)

The foreign title of baron is occasionally borne by English subjects, but confers no precedence in the United Kingdom. It may be Russian, e.g. Baron Djimsdale (1762); German, e.g. Baron Stockmark, Baron Halkett (Hanoverian); Austrian, e.g. Baron Rothschild (1822), Baron de Worms; Italian, e.g. Baron Heath; French, e.g. Baron de Teissier; French-Canadian, e.g. Baron de Longueil (1700); Dutch, e.g. Baron Mackay (Lord Raye).

The Foreign Title.—On the continent of Europe the title baron, though the same in its origin, has come, owing to a variety of causes, to imply a rank and status very different from its connotation in the United Kingdom, and again varies considerably in different countries. Originally baro meant no more than “man,” and is so used in the Salic and other “barbarian” laws; e.g. Si quis mortuus est baro vel feminam, &c. (Lex Alema, tit. 76). In this way, too, it was long preserved in the sense of “husband,” as in the Assize of Jerusalem (MSS. cap. 98): Si fons aupele aucune femme qui aura baron, et il la veut defende, il la peut defendre de son cors, &c. Gradually the word seems to have been attached to any member of the nobility, and (in a more general sense) “magnate.” Finally, in France in the 12th century the general expression barones was introduced in a restricted sense, as applied properly to all lords possessing an important fief, subject to the rule of primogeniture and thus not liable to be divided up, and held of one overlord alone. Sometimes it included ecclesiastical lordships of the first rank. In the 13th century the Register of King Philip Augustus places the barones regis Francie next to the dukes and counts holding in chief, the title being limited to vassals of the second rank. Towards the end of the century the title had come to mean that its bearer held his principal fief direct from the crown, and was therefore more important than that of count, since many counts were only mediate vassals. Thus the kings in granting a duchy or countyship as an apanage to their brothers or sons used the phrase in comitalium et baroniam. From this period, however, the title tends to sink in comparative importance. When, in the 14th century, the feudal hierarchy was completed and stereotyped, the barons are ranked not only below counts, but below viscounts, though in power and possessions many barons were superior to many counts. In any case, restricted to the 17th century, the title of baron should not be borne by the holder of a territorial barony; and it was Louis XIV. who first cheapened the title in France by creating numerous barons by royal letters. This entire dissociation of the title from the idea of feudal rights and obligations was completed by Napoleon’s decree of March 1, 1808, reviving the ancient titles. By this instrument the title of baron was to be borne ex officio by a number of high officials, e.g. ministers, senators, councillors of state, archbishops and bishops. It was given to the 37 mayors who attended the coronation, and could be claimed by any mayor who had served to the emperor’s satisfaction for ten years, and by any member of an electoral college who had attended three sessions. The title was made to descend in order of primogeniture to legitimate or adopted sons and to the nephews of bishops, the sole condition being that proof must be presented of an actual income of 15,000 francs, of which one-third should descend with the title. The creation of barons was continued by Louis XVIII., Charles X. and Louis Philippe, and suspended at the revolution of 1848, was revived again on a generous scale by Napoleon III. The tolerant attitude of the Third Republic towards titles, which it does not officially recognize, has increased the confusion by facilitating the assumption of the title on very slender grounds of right. The result has been that in France the title of Baron, unless borne by the recognized representative of a historic name, not only involves no political status, but confers also but very slight social distinction.

The same is true, mutatis mutandis, of most other European countries, and notably of Italy. In Austria and Germany the
BARONET

423

case is somewhat different. Though in Latin documents of the middle ages the term *barones for liberi domini* was used, it was not until the 15th century that the word *Baron*, perhaps under the influence of the court of Versailles, began to be used as the equivalent of the old German *Freiherr*, or free lord of the Empire. The style *Freiherr* (*liber dominus*) implied originally a dynastic status, and many *Freiherren* held countships without taking the title of count. When more important of them styled themselves counts, the Freiherren sank into an inferior class of nobility. The practice of conferring the title *Freiherr* by imperial letters was begun in the 16th century by Charles V., was assumed on the ground of special imperial concessions by many of the princes of the Empire, and is now exercised by all the German sovereigns. Though the practice of all the children taking the title of their father has tended to make that of Baron comparatively very common, and has dissociated it from all idea of territorial possession, it still implies considerable social status and privilege in countries where a sharp line is drawn between the caste of nobles and the common herd, whom no wealth or intellectual eminence can place on the same social level with the poorest Adeliger. In Japan the title baron (*Dan*) is the lowest of the five titles of nobility introduced in 1885, on the European model. It was given to the least important class of territorial nobles, but is also bestowed as a title of honour without reference to territorial possession.

BARONET. Although the origin of this title has been the subject of learned speculation, it is not known for certain why it was selected as that of "a new Dignitate between Barons and Knights" created by James I. The object of its institution was to raise money for the crown, as was also done by the sale of peerage dignities under this sovereign. But the money was professedly devoted to the support of troops in Ulster, that is, each grantee was to be liable for the pay of thirty men, at 8d. a day for three years. This amounted to £300, which was the sum paid for the honour. When it was instituted, in May 1611, the king, to keep the baronetage select, canvasset that he would not create more than two hundred, and that only those who had £1000 a year in landed estate and whose paternal grandfathers had borne arms should receive the honour. But these qualifications were before long abandoned. As an inducement to apply for it, it was made to confer the prefix of "Sir" and "Lady" (or "Dame"), and was assigned precedence above knights, though below the younger sons of barons. Eight years later (20th of September 1619), the baronetage of Ireland was instituted, the king pledging himself not to create more than a hundred baronets. Meanwhile, questions had arisen as to the exact precedence of the baronets, and James by royal decree (28th of May 1612) had announced that it was his intention to rank them below the younger sons of barons. As this had the effect of stopping applications for the honour, James issued a fresh commission (22nd of November 1611) to encourage them and finally, "the Kings wants might be much relieved out of the vanities and ambition of the gentrie" (in Chamberlain's words), he granted, in 1616, the further privilege that the heirs apparent of baronets should be knighted on coming of age. The baronetage of Nova Scotia was devised in 1624 as a means of promoting the "plantation" of that province, and James announced his intention of creating a hundred baronets, each of whom was to support six colonists for two years (or pay 2000 marks in lieu thereof) and also to pay 1000 marks to Sir William Alexander (afterwards earl of Stirling), to whom the province had been granted by charter in 1621. For this he was to receive a "free barony" of 16,000 acres in Nova Scotia, and to become a baronet of "his Hienes Kingdom of Scotland". James dying at this point, Charles I. carried out the scheme, creating the first Scottish baronet on the 28th of May 1625, coining it in the creation charter that the baronets of Scotland or of Nova Scotia "should never exceed a hundred and fifty in number, that their heirs apparent should be knighted on coming of age, and that no one should receive the honour who had not fulfilled the conditions, viz. paid 3000 marks (£166, 13s. 4d.) towards the plantation of the colony. Four years later (17th of November 1629) the king wrote to "the contractors for baronets," recognizing that they had advanced large sums to Sir William Alexander for the plantation on the security of the payments to be made by future baronets, and empowering them to offer a further inducement to applicants; and on the same day he granted to all Nova Scotia baronets the right to wear about their necks, suspended by an orange tawny ribbon, a badge bearing an azure saltire with a crowned inesicuchene of the arms of Scotland and the motto "Faux mentis honesta gloria." As the required number, however, could not be completed, Charles announced in 1633 that English and Irish gentlemen might receive the honour, and in 1634 they began to do so. Yet even so, he was only able to create a few more than a hundred and twenty in all. In 1638 the creation ceased to carry with it the grant of lands in Nova Scotia, and on the union with England (1707) the Scottish creations ceased, English and Scotsmen alike receiving thenceforth baronetcies of Great Britain.

It is a matter of dispute whether James I. had kept faith with the baronets of England as to limiting their number; but his son soon rejected the restriction freely. Creations became one of his devices for raising money; blank patents were hawked about, and in 1641 Nicholas wrote that baronetcies were to be had for £400 or even for £350; a patent was offered about this time to Mr Wrottesley of Wrottesley for £300. On the other hand, the honour appears to have been bestowed for nothing on some ardent royalists when the great struggle began.

Cromwell created a few baronets, but at the Restoration the honour was bestowed so lavishly that a letter to Sir Richard Leveson (3rd of June 1660) describes it as "too common," and offers to procure it for any one in return for £300 or £400. Sir William Wiseman, however, is said to have given £500.

The history of the baronetage was eventful till 1785, when in consequence of the wrongful assumption of baronetcies, an old and then increasing evil, a royal warrant was issued (6th of December) directing that no one should be recognized as a baronet in official documents till he had proved his right to the dignity, and also that those created in future must register their arms and pedigree at the Heralds' College. In consequence of the opposition of the baronets themselves, the first of these two regulations was rescinded and the evil remained unabated. Since the union with Ireland (1800) baronets have been created, not as of Great Britain or of Ireland, but as of the United Kingdom.

In 1834 a movement was initiated by Mr Richard Broun (whose father had assumed a Nova Scotia baronetcy some years before, to obtain certain privileges for the order, but on the advice of the Heralds' College, the request was refused. A further petition, for permission to all baronets to wear a badge, as did those of Nova Scotia, met with the same fate in 1836. Meanwhile George IV. had revoked (19th of December 1827), as to all future times the right of baronets' eldest sons to claim knighthood. Mr Broun claimed it as an heir apparent in 1836, and made a final meeting with refusal, publicly assumed the honour in 1842, a foolish and futile act. In 1854 Sir J. Kingston James was knighted as a baronet's son, and Sir Ludlow Cotter similarly in 1874, on his coming of age; but when Sir Claude de Crespigny's son applied for the honour (17th of May 1895), his application was refused, on the ground that the lord chamberlain did not consider the clause in the patent (1805) valid. The reason for this decision appears to be unknown.

Mr Broun's subsequent connexion with a scheme for reviving the territorial claims of the Nova Scotia baronets as part of a colonizing scheme need not be discussed here. A fresh agitation was aroused in 1897 by an order giving the sons of life peers precedence over baronets, some of whom formed themselves, in 1898, into "the Honourable Society of the Baronetage" for the maintenance of its privileges. But a royal warrant was issued on the 15th of August 1898, confirming the precedence complained of as an infringement of their rights. The above body, however,
BARONIUS—BAROTSE

has continued in existence as the “Standing Council of the Baronetage,” and succeeded in obtaining invitations for some representatives of the order to the coronation of King Edward VII. It has been sought to obtain badges or other distinctions for baronets and also to purge the order of wrongful assumptions, an evil to which the baronetage of Nova Scotia is peculiarly exposed, owing to the dignity being descendible to collateral heirs male of the grantee as well as to those of his body. A departmental committee at the home office was appointed in 1906 to consider the question of such assumptions and the best means of stopping them.

All baronets are entitled to display in their coat of arms, either on a canton or on an inscenethea, the red hand of Ulster, save those of Nova Scotia, who display, instead of it, the saltire of that province. The precedence of baronets of Nova Scotia and of Ireland in relation to those of England was left undetermined by the Acts of Union, and appears to be still a moot point with heralds. The premier baronet of England is Sir Hickman Bacon, whose ancestor was the first to receive the honour in 1611.

BARONIUS, CAESAR (1538-1607), Italian cardinal and ecclesiastical historian, was born at Sora, and was educated at Veroli and Naples. At Rome he joined the Oratory in 1557 under St. Philip Neri (q.v.) and succeeded him in superior in 1593. Clement VIII., whose confessor he was, made him cardinal in 1596 and librarian of the Vatican. At subsequent conclaves he was twice nearly elected pope, but on each occasion was opposed by Spain on account of his work On the Monarchy of Sicily, in which he supported the papal claims against those of the Spanish government. Baronius is best known by his Annales Ecclesiastici, undertaken by the order of St. Philip as an answer to the Magdeburg Centuries. After nearly thirty years of lecturing on the history of the Church at the Vallicella and being trained by St. Philip as a great man for a great work, he began to write, and produced twelve folios (1588-1609). In the annales he treats history in strict chronological order and keeps theology in the background. In spite of many errors, especially in Greek history, in which he had to depend upon secondhand information, the work of Baronius stands as an honest attempt to write history, marked with a sincere love of truth. Sarpi, in urging Casaubon to write against Baronius, warns him never to charge or suspect him of bad faith, for no one who knew him could accuse him of disloyalty to truth. Baronius makes use of the words of St. Augustine: “I shall love with a special love the man who most rigidly and sincerely corrects my errors.” He also undertook a new edition to the Roman martyrology (1586), which he purified of many inaccuracies.

His Annales, which end in 1598, were continued by Rinaldi (6 vols., 1676-1677); by Laderchi (3 vols., 1728-1737); and by Theiner (5 vols., 1856). The most useful edition is that of Mansi (8 vols., 23 vols., 1728-1759), giving Pagi’s corrections at the foot of each page. (E. Tn.)

BARONY, the domain of a baron (q.v.). In Ireland counties are divided into “baronies,” which are equivalent to the “hundreds” (q.v.) in England, and seem to have been formed out of the territories of the Irish chieftains, as each submitted to English rule. (General Report of the Census of England,iv. 181.) In Scotland the term is applied to any large freehold estate even when held by a commoner. Barony also denotes the rank or dignity of a baron, and the feudal tenure “by barony.”

BAROQUE, a technical term, chiefly applicable to architecture, furniture and household decoration. Apparently of Spanish origin—a barro is a large, irregularly-shaped pearl—the word was for a time confined to the craft of the jeweller. It indicates the more extravagant fashions of design that were current in the second half of the 18th century, chiefly in Italy and France, in which everything is fantastic, grotesque, florid or incongruous—irregular shapes, meaningless forms, an utter lack of restraint and simplicity. The word suggests much the same order of ideas as rococo.

BAROSS, GABOR (1848-1892), Hungarian statesman, was born at Trenčín on the 6th of July 1848, and educated at Esztergom. He was for a time one of the professors there under Cardinal Kolos Vaszary. After acquiring considerable local reputation as chief notary of his county, he entered parliament in 1875. He at once attached himself to Kálmán Tisza and remained faithful to his chief even after the Bosnian occupation had alienated so many of the supporters of the prime minister. It was he who drew up the reply to the malcontents on this occasion, for the first time demonstrating his many-sided ability and his genius for sustained hard work. But it was in the field of economics that he principally achieved his fame. In 1883 he was appointed secretary to the ministry of ways and communications. Baross, who had prepared himself for quite another career, and had only become acquainted with the civilized West at the time of the Composition of 1867, mastered, in an incredibly short time, the details of this difficult department. His zeal, conscientiousness and energy were so universally recognized, that on the retirement of Gábor Kemény, in 1886, he was appointed minister of ways and communications. He devoted himself especially to the development of the national railways, and the gigantic network of the Austro-Hungarian railway system and its unification is mainly his work. But his most original creation in this respect was the zone system, which immensely facilitated and cheapened the circulation of all goods and persons; in the broadest sense this was a method of effective control with communication with the central point at Budapest. The amalgamation of the ministry of commerce with the ministry of ways in 1889 further enabled Baross to realize his great idea of making the trade of Hungary independent of foreign influences, of increasing the commercial productivity of the kingdom and of gaining every possible advantage for her export trade by a revision of tolls. This patriotic policy provoked loud protests both from Austria and Germany at the conference of Vienna in 1890, and Baross was obliged somewhat to modify his system. This was by no means the only instance in which his commercial policy was attacked and even hampered by foreign courts. But wherever he was allowed a free hand he introduced epoch-making reforms in all the branches of his department, including posts, telegraphs, &c. A man of such strength of character was not to be turned from his course by any amount of opposition, and he rather enjoyed to be alluded to as the “iron-handed minister.”

The crowning point of his railway policy was the regulation of the Danube at the hitherto impassable Iron-Gates Rapids by the construction of canals, which opened up the eastern trade to Hungary and was an event of international importance. It was, while on an official visit to Paris in May 1889 that he caught a chill, from which he died on the 8th of May. The day of his burial was a day of national mourning, and rightly so, for Baross had dedicated his whole time and genius to the promotion of his country’s prosperity.

See László Petrovics, Biography of Gabriel Baross (Hung. Eperjes, 1892). (R. N. B.)

BAROTAC NUVO, a town of the province of Iloilo, Panay, Philippine Islands, near the Jalarur river, above its mouth on the S.E. coast, and about 15 m. N.E. of Iloilo, the capital. Pop. (1903) 9904; in 1903 after the census had been taken the neighbouring town of Dumangas (pop. 12,428) was annexed to Barotac Nuevo. The town lies in a fertile plain and deals in rice, tre pang and pina. Here, in what was formerly Dumangas, are a fine church and convent, built of iron, pressed brick and marble. Dumangas was destroyed by fire in June 1900, during a fight with insurgents, but its rebuilding was begun in May 1901.

BAROTSE, BAROTSALAND, a people and country of South Central Africa. The greater part of the country is a British protectorate, forming part of Rhodesia. The Barotse are the paramount tribe in the region of the Upper Zambezi basin, but by popular usage the name is also applied to contiguous subject tribes, Barotseland being the country over which the Barotse paramount chief exercises authority. The present article treats (1) of the people, (2) of the country, (3) of the establishment of the British protectorate and of subsequent developments.

1. The Barotse.—These people, originally known as Aalui, have
occupied the extensive plain through which the Zambesi passes from 14° 35' S. to 16° 25' S. throughout the reigns of twenty-two successive paramount chiefs and therefore approximately since the commencement of the 17th century. Previously, for an indefinite period, they dwelt on the Kabombo river, 200 m. to the N.E. of their present country, and here the descendants of a section of the tribe which did not migrate still remain, under the name Balokwaka (men of the ambuscade), formerly known as Aâkiloului. That the Barotse at a still more remote period emigrated from the far north-east is indicated by vague tradition as well as by a certain similarity in type and language to some tribes living in that direction, though the fact that natives from Mashonaland can understand those at Lialui (the Barotse capital) has led to the assumption by some writers that the Barotse are an offshoot of the Mashona. The variety in type among the Mashona and the homogeneity of the Barotse would rather point to an opposite conclusion.

Early in the 19th century a section of the Basuto tribe known as Makololo trekked from the south of what is now the Orange River Colony and fought their way through Bechuanaland and the Kalahari to the land of the Barotses. They eventually subjugated the chiefs of Sebela and Sebula, who as an administrator-general was far in advance of his compatriots, established the rule of his house for some forty years, until about 1865 an organized rebellion of the Barotse led to the almost complete extinction of this Makololo oligarchy and the reinstatement of the original dynasty. It was the Makololo who gave the Barotse their present name (Rosete, plain—Barotse, country of the plain—Murotse, man of the plain—Marto, people of the plain, the latter being inaccurately rendered Barotse, Bo being the equivalent of Ma in certain other languages).

The Barotse proper are comparatively few in number, but as is inferred from the fact that for many generations they have held in sway a country two and a half times the size of Great Britain, they are the intellectual and physical superiors of the vast majority of the negro races of Africa. Very black, tall in stature, deep in chest and comparatively speaking refined in feature, a Barotse is readily distinguishable amidst a mixed group of natives. Being numerically small they form an oligarchy in which, with few exceptions, each man holds rank in a chiefship of which there are three grades. Next to the chiefs rank their descendants who have not themselves acquired chief's rank and hold an intermediate position as freeborn; all others, whether members of the subject-tribes or prisoners of war, being, up to 1906, mere slaves. This class was also graded. Slaves might own slaves who in their turn might own slaves, the highest grade always being directly responsible to some Barotse chief. As a reward of gallantry or ability the paramount chief occasionally conferred chief's rank on individuals not of Barotse birth, and these ipso facto assumed the name and privileges of the Barotse. It was a counterpart of the feudal system of Europe in which every grade from king to serf found a place. In 1906 the paramount chief, by proclamation, abolished the last vestiges of slavery, an act which, however, left untouched the predominant position of the Barotse and their rights to chiefship. The paramount chief shares with a queen (Mokwai) his authority and prerogatives. The Mokwai is not the wife but the eldest sister of the ruling chief. With his death her privileges lapse. Theoretically, these co-rulers are equal, neither may promulgate a national decree without the assent of the other, but each has a capital town, councillors and absolute authority in a province, the two having joint authority over all other provinces. In their code of laws the Barotse show an advance on the standard of probably any other African negro state. By right, an accused chief is tried by his peers, each of whom in rotation from junior to senior gives his verdict, after which the president reports the finding of the court to the paramount chief, who passes sentence. As to their religious beliefs the Barotse imagine the sun to be the embodiment of a great god whose sole care is for the amelioration of man. Him they worship, though more pains are taken to appease evil spirits, in whose existence they also believe, to whom every evil to which man is heir is attributed.

The spirits of ancestors—especially of deceased chiefs—are also objects of worship. Christianity, of a Protestant evangelical type, was first introduced into the country in 1854 by François Coillard and has made some progress among the people, among the converts being Leath, eldest son and heir of Lewanika, the paramount chief.

2. Barotseland.—This term includes, in the sense of the country in which the authority of the paramount Barotse chief is acknowledged, not only the lands of the Barotse proper, but the territory of fifteen contiguous and subject tribes. This vast territory extends approximately from the Kwito river in the west to the Kafue river in the east, and from the Congo-Zambesi watershed in the north to the Linyante or Kwaondo river and Zambesi in the south, and may be divided into three groups:—

(a) Central provinces directly administered by the paramount chief from the capital Lialui (a town on the Zambesi), by the Mokwai from Nalolo, and by two chiefs from the blood of Sesheke;

(b) Outlying provinces over which, in the absence of a central local system of government, Barotse chiefs administer districts under the direction of the paramount chief; and

(c) Tribes over which the local chiefs are permitted to retain their position subject to the payment of annual tribute and to their doing homage in person at Lialui when called upon to do so.

With the publication of the king of Italy's award in 1905 in the Anglo-Portuguese Barotse Boundary dispute (see below), the term Barotseland may be said to have acquired a second meaning. By this award the western and part of the northern section of Barotseland as described above were declared to be outside the dominion of the paramount chief and therefore not in the British sphere of influence, while tribal boundaries were complicated by the introduction of a longitudinal and latitudinal frontier. Though this award altered the political boundaries, ethnologically Barotseland remains much as above described. The area of the country under British protection is about 182,000 sq. m.

Excluding the ridge of high ground running east and west which, culminating at a height of 5000 ft., forms the Congo-Zambesi water-parting, the extreme east (Batoka) and the district in the immediate vicinity of the Victoria Falls (qr.) throughout which, with local variations, a red laterite clay predominates, the main physical features of Barotseland may be described as a series of heavy white sand undulations covered with subtropical forest vegetation. These are intersected by alluvium-charged valleys through which streams and rivers flow towards the central basin of the Upper Zambesi. There is evidence that this has at one time been the site of a large lake. These valleys, which towards the close of the wet season become inundated, afford rich cattle pasture, the succulence of which prevents cattle losing condition towards the end of the dry season, as is the case in many parts of Africa. There seems to be little or no indication of mineral wealth in the white sand area, but in the north and east there is not only every prospect of a great agricultural and pastoral future but also of considerable mining development. Though basalt predominates in the neighbourhood of the Victoria Falls and large fields of granite occur on the Batoka plateau and elsewhere, there is every indication of the existence of useful minerals in these districts. Gold, copper, tin, lead, zinc and iron have been discovered.

Much of the area of Barotseland is within the healthy zone, the healthiest districts being the Batoka and Mashikumbwe plateaus in the east with extreme altitudes of 4400 and 4150 ft. respectively, and the line of the Congo-Zambesi watershed which rises to 5000 ft. in many places. The Zambesi valley from the Victoria Falls (3000 ft.) to the Kabombo confluence (3500 ft.), though involving little or no risk to health to the traveller, cannot be considered suitable for white settlement. Taking into consideration the relative value of altitude to latitude, the plateau land of Barotseland compares very favourably with existing conditions elsewhere, being several degrees more temperate than would be expected. Approximately the mean
maximum and minimum temperatures stand at 86° and 55°F respectively, with an extreme range of 100° to 35° and a mean annual temperature of 69 to 70°. The rainfall varies according to district from 22 to 32 in. a year and has shown extraordinary stability. Since 1887, the first year in which a record was taken by François Coillard, Barotseland has known no droughts, though South Africa has suffered periodically in this respect.

The Zambezi, as would be expected, forms a definite boundary line in the distribution of many species of fauna and flora. In these respects, as well as from an ethnological standpoint, Barotseland essentially belongs not to South but to Central Africa. The great river has also served to prevent the spread from South Africa into Barotseland of such disastrous cattle diseases as tick fever and lung sickness.

3. The Establishment of British Suzerainty.—By the charter granted to the British South Africa Company in October 1889, the company was allowed to establish its rule in the regions north of the Middle Zambezi not included in the Portuguese dominions, and by a treaty of the 1st of June 1891 between Great Britain and Portugal it was declared that the Barotse kingdom was within the British sphere of influence. The dispute between the contracting powers as to what were the western limits of Barotseland was eventually referred to the arbitration of the king of Italy, who by his award of the 30th of May 1892, fixed the frontier river as far as the point on the meridian between the 15th and 16th meridians E., and afterwards drawing the meridian up to the 13° S., which parallel it follows as far east as 24° E., and then that meridian to the Belgian Congo frontier. In the meantime the British South Africa Company had entered into friendly relations with Lewanka (q.v.), the paramount chief of the Barotseland and an administrateur was appointed on behalf of the company to reside in the country. A native police force under the command of a British officer was raised and magistrates and district commissioners appointed. In the internal affairs of the Barotse the company did not interfere, and the relations between the British and Barotse have been uniformly friendly. The pioneers of Western civilization were not, however, the agents of the Chartered Company, but missionaries. F. S. Arnot, an Englishman, spent two years in the country (1882–1884) and in 1889 a mission, fruitful of good results, was established by the Société des Missions Evangéliques de Paris. Its first agent was François Coillard (1834–1904), who had previously been engaged in mission work in Basutoland and who devoted the rest of his life to the Barotse. Though always an admirer of British institutions and anxious that the country should ultimately fall under British control, Coillard himself, who was present at the first instance, was anxious to delay the advent of white men into the country. It was contrary to his advice that Lewanka petitioned the “Great White Queen” to assume a protectorate over his dominions, but from the moment Great Britain assumed responsibility and the advance of European civilization became inevitable, all the influence acquired by Coillard’s exceptional personal magnetism and singleness of purpose was used to prepare the way for the extension of British rule. Only those few pioneers who knew the Barotse under the old conditions can fully realise what civilization and England owe to the co-operation of this high-minded Frenchman.

Under the Chartered Company’s rule considerable progress has been made in the development of the resources of the country, especially in opening up the mining districts in the north. The seat of the administration, Kalomo, is on the “Cape to Cairo” railway, about midway between the Zambezi and Kafue rivers. The railway reached the Broken Hill copper mines, 110 m. N. of the Kafue in 1906, and the Belgian Congo frontier in 1910. From Lobito Bay in Portuguese West Africa a railway was being built in 1910 which would connect with the main line near the Congo frontier. This would not only supply Barotseland with a route to the sea alternative to the Beira and Cape Town lines, but while reducing the land route by many hundred miles would also supply a seaport outlet 1700 m. nearer England than Cape Town and thus create a new and more rapid mail route to southern Rhodesia and the Transvaal. The Zambezi also, with Kebraabsa as its one bar to navigation between Barotseland and the sea, will supply a cheap line of communication. (See RHODESIA.)

BAROUCHE—BARRACKPUR

BAROUCHE (Ger. barouche, Span. barrocho, Ital. barocco; from Lat. bi-rotus, double-wheeled), the name of a sort of carriage, with four wheels and a hood, arranged for two couples to sit inside facing one another.

BARQUISIMETO, a city of western Venezuela, capital of the state of Lara, on the Barquisimeto river, 107 m. by rail S.W. of Tucacas, its port on the Caribbean coast. Pop. (est. 1899) 40,000. It is built in a small, fertile valley of the Merida Cordilleras, 1895 ft. above sea-level, has a temperate, healthy climate with a mean annual temperature of 78° F., and is surrounded by a highly productive country from which are exported coffee, sugar, cacao and rum. It is also an important distributing centre for the produce of the northern part of Venezuela. The railway, with its stations in Barquisimeto, is regularly laid out and well built, and is well provided with educational and charitable institutions. Barquisimeto was founded in 1522 by Juan de Villegas, who was exploring the neighbourhood for gold, and it was first called Nueva Segovia after his native city. In 1807 its population had risen to 15,000, principally through its commercial importance, but on the 26th of March 1812 it was totally destroyed by an earthquake, and with it 1500 lives, including a part of the revolutionary forces occupying the town. It was soon rebuilt and is one of the few cities of Venezuela which have recovered from the ravages of the war of independence and subsequent disorders.

BARR, a town of Germany, in the imperial province of Alsace-Lorraine, on the Kirn, 13 m. N. from Schlettstadt by rail. It has an Evangelical and a Roman Catholic church and considerable tanneries. There is an active trade in wine and timber. Pop. (1900) 3243.

BARRA, of Barray (Scand. Baray, isle of the ocean), an island of the outer Hebrides, Inverness-shire, Scotland. Pop. (1901) 2362. It lies about 5 m. S.W. of South Uist, is 8 m. in circumference, and has about 100 inhabitants. It is divided into two parts by a narrow isthmus of land 2 m. below Scurivial Point, where it is only a few hundred yards broad. The rock formation is granite. The highest hill is Heaval (1360 ft.) and there are several small lochs. The chief village is Castlebay, at which the Glasgow steamer calls once a week. This place derives its name from the castle of Kishmul standing on a rock in the bay, which was once the stronghold of the McNeills of Barra, one of the oldest of Highland clans. There are remains of ancient churches, Danish dunes and Druidical circles on the island. There is communication by ferry with South Uist. The parish comprises a number of smaller islands and islets—among them Fride, Gighay, Hellys, Ploida to the N.E., and Vatersay, Pabbay, Mingalay (pop. 135) and Berneray to the S.E.—and contains 4000 acres of arable land and 18,000 acres of meadow and hill pasture. The cod, ling and herring fisheries are important, and the coasts abound with shell-fish, especially cockles, for which it has always been famous. On Barra Head, the highest point of Berneray, and also the most southerly point of the outer Hebrides chain, is a lighthouse 68 ft. above high water.

BARRACKPUR, a town and magisterial subdivision of British India, in the district of Twenty-four Parganas, Bengal. The town is the largest cantonment in Lower Bengal, having accommodation for two batteries of artillery, the wing of a European regiment and two native battalions. Its name is said to be derived from the fact of troops having been stationed here since 1772. It is a station on the Eastern Bengal railway. Job
BARRACKS

Charnock, the founder of Calcutta, erected a bungalow and established a small bazaar here in 1660. The cantonment is situated on the left bank of the Hugli; it has also a large bazaar and several large tanks, and also a parade ground. To the south of the cantonment is situated the park, created by the taste and public spirit of Lord Wellesley. Within the park is situated the Government House, a noble building begun by Lord Minto, and enlarged into its present state by the marquess of Hastings. The park is beautifully laid out, and contains a small menagerie. Its most interesting feature is now Lady Canning's tomb. Barrackpur played an important part in the two Sepoy mutinies of 1854 and 1857, but the details of these belong to the general history of British rule in India. North Barrackpur had a population in 1901 of 12,600 and south Barrackpur of 19,307.

Barrackpur subdivision was formed in 1904. It contains an area of 190 sq. m., which, at the census of 1901, had a population of 266,312, a large proportion being workers in the mills on the left bank of the Hugli.

**BARRACKS** (derived through the French from the Late Lat. *barr*, a bar), the buildings used for the accommodation of military or naval forces, including the quarters for officers, warrant officers, non-commissioned officers and men, with their messes and recreation establishments, regimental offices, shops, stores, stables, vehicle sheds and other accessory buildings for military or domestic purposes. The term is usually applied to permanent structures of brick or stone used for the peace occupation of troops; but many hut barracks of corrugated iron lined with wood have been built, generally in connexion with a training ground for troops, and in these the accommodation is somewhat less than in permanent barracks, and conditions more nearly approach those of a military encampment.

**British System.**—The accommodation to be given in British military barracks is scheduled in the Barrack Synopsis, which contains statements of particulars, based upon decisions which have, from time to time, been laid down by authority, as regards the military buildings authorized for various units, and the accommodation and fittings to be provided in connexion therewith. Each item of ordinary accommodation is described in the synopsis, and the areas and cubic contents of rooms therein laid down form the basis of the designs for any new barracks. Supplementary to the synopsis is a series of "Standard Plans," which illustrate how the accommodation may be conveniently arranged; the object of the issue of these plans is to put in convenient form the best points of previous designs, and to avoid the necessity of making an entirely fresh design for each building that is to be erected, by using the standard type modified to suit local conditions. External appearance is considered with regard to the materials to be used, and the position the buildings are to occupy; convenience of plan and sound sanitary construction being the principal objects rather than external effect, designs are usually simple, and depend for architectural effect more on the grouping and balance of the parts than on ornamentation such as would add to expense. The synopsis and standard plans are from time to time revised, and brought up to date as improvements suggest themselves, and increases in scale of accommodation are authorized, after due consideration of the financial effect; so that systematic evolution of barracks design is carried on.

**Modern British Barracks.**—A description of a modern barracks for a battalion of infantry will give an idea of the standard of accommodation which is now authorized, and to which older barracks are gradually remodelled as funds permit. The unmarried soldiers are quartered in barrack-rooms usually planned to contain twelve men in each; this number forms a convenient division to suit the organization of the company, and is more popular with the men than the larger numbers which were formerly the rule in each barrack-room; there is a greater privacy, whilst the number is not too small to keep up the feeling of barrack-room comradeship which plays an important part in the soldier's training. The rooms give 600 cub. ft. of air per man, and have windows on each side: the beds are spaced between the windows so that only one bed comes in a corner, and not more than two between any two windows: inlet ventilators are fixed high up in the side walls, and an extract shaft warmed by the chimney flue keeps up a circulation of air through the room: the door is usually at one end of the room and the fireplace at the opposite end: over each man's bed is a locker and shelf where he keeps his kit, and his rifle stands near the head of his bed. Convenient of access from the door to the barrack-room is the ablution-room with basins and foot-bath; also disconnected by a lobby is a water-closet and urinal for night use, others for day use being provided in separate external blocks. Baths are usually grouped in a central bath-house adjacent to the cook-house, and have hot water laid on. For every two or four barrack-rooms, a small single room is provided for the occupation of the sergeant in charge, who is responsible for the safety of a small store, where men may leave their rifle and kit when going on furlough. Adjacent to the barrack blocks and next to the cook-house are arranged the dining-rooms where the men assemble for their meals; no food is now served in the barrack-rooms, and the air in them is thus kept much purer and fresher than under the old system. The dining-rooms are lofty and well ventilated, and are warmed by hot water; tables and forms are arranged so as to make the most of the space, and room is provided for all the men to dine simultaneously.

Next to the dining-room is the cook-house where the meals for a half battalion are cooked, and served direct to the dining-rooms on each side. Wash-up rooms are arranged off the serving-lobby with plate-racks and shelves for the storage of the crockery after it has been washed. The cooking apparatus is designed for economical use of coal fuel, and, if carefully used, consumes little more than ½ lb. of coal per man per day. The cook-house is well lighted and ventilated by a top lantern; tables, dressers, and pastry slab are provided for preparing and serving the meals, and a sink for washing kitchen utensils. Under the kitchen block is a basement containing the boiler for heating the dining-rooms and another for the supply of hot water to baths and sinks, with in some cases also a hot-air furnace for heating drying-rooms, for drying the men's clothing when they come in wet from a route-march or field day. Not far from the barracks blocks is placed the recreation establishment or soldiers' club, where the rank and file may go for relaxation and amusement when off duty; this establishment has, on the ground floor, a large and lofty room with a stage at one end for lectures or entertainments, and at the other
end is a supper bar, extending across the room, where mineral waters and other light refreshments are sold; tables are also arranged for suppers. A grocery shop is provided where the men and their families may purchase goods bought under regimental arrangements at reduced prices, and sold without more profit than is necessary to keep the institution self-supporting. On the first floor are billiard and games room, reading-room and library, and writing-room. The manager's quarter and kitchen premises complete the establishment. Near the recreation establishment is the canteen, devoted solely to the sale of beer, and not permitted to vie in attractiveness with the recreation establishment. A bar is provided for the soldiers, a separate room for corporals, and a jug department for the supply of the families; this building also has a manager's quarter attached to it, and an office for the checking of accounts.

For the senior non-commissioned officers a sergeant's mess is provided, containing dining-room, reading-room and billiard-room, with kitchen premises and liquor store, which also has a jug department for the sergeant's families. The single non-commissioned officers have all their meals in this mess, and the married members also use it as a club. The warrant officers, and the proprietors of the squad and officers and men who are in the married establishment, are provided with accommodation at some little distance from the men's barracks. In all recent schemes, on open sites, self-contained cottages have been built, and these are more popular than the older pattern of tenement buildings approached by common staircases or verandas. The warrant officers are allowed a living-room, kitchen, and scullery, with three bedrooms and a bathroom. The married soldiers have a living-room, scullery, and one, two, or three bedrooms according to the size of their families. A laundry is provided adjacent to the married quarters, equipped with washing-troughs, wringer, drying-closet, and ironing-room; and the women are encouraged to use this in preference to doing washing in their cottages.

Officers' Quarters.—At a little distance from the men's barracks, and usually looking over the parade or cricket ground, is the officers' mess. This building has an entrance-hall with band alcove, where the band plays on guest nights; on one side of the hall is the mess-room (or dining-room), and on the other the ante-room (or reading-room), whilst the billiard-room and kitchen are kept to the back so that lantern lights can be arranged for. A mess office is provided, and all the accessories required for the mess waiters' department, including pantry, plate-closet and cellargle, and for the kitchen or mess-man's department, with also a quarter for the mess-man. The officers' quarters are usually arranged in wings extending the frontage of the mess building, and in a storey over the mess itself. Each officer has a large room, part of which is partitioned off for a bedroom, and the field officers are allowed two rooms. The soldier servant, told off to each officer, has a small room allotted for cleaning purposes, and bathrooms, supplied with hot water from the mess kitchen, are centrally situated. A detached house, containing three sitting-rooms, seven bed- and dressing-rooms, bath, kitchen, scullery, and the usual accessories, is provided for the commanding officer; and a smaller house, having two sitting-rooms, four bedrooms, bath, kitchen, &c., for the quartermaster. Other regimental married officers are not provided for, and have to arrange to house themselves, a lodging allowance being usually granted.

Regimental Accessories.—Apart from the buildings providing accommodation, others are required for administrative and military purposes. These are the guard house and regimental offices, the small-arm ammunition store, the fire-engine house, the drill and gymnastic hall, and the medical inspection block with dispensary, where the sick are seen by a medical officer and either prescribed for or sent into hospital, as may be necessary. Stables are provided for the officers' and transport horses, and a vehicle shed and storehouse for the mobilization equipment. Stores are required for bread, meat, coal, clothing, and for musketry, signalling, and general small stores under the quartermaster's charge—also workshops for armourers, carpenters, plumbers, painters and glaziers, shoemakers, and tailors. Mention of the five's court, recreation ground and parade ground completes the description of a battalion barracks.

Cavalry Barracks.—The accommodation provided for cavalry is very similar to that already described for infantry. The barrack blocks are arranged to suit the organization of the regiment, and are placed so that the men can turn out readily and get to their horses. Detached buildings are provided for cavalry troop stables, one block for the horses of each troop. Formerly stables were often built for convenience with the barrack-rooms over them; but this system has been abandoned on sanitary grounds, to the benefit of both men and horses. Each horse is given 1,500 cub. ft. of air space, the horses' heads are turned to the outer walls, and provision is made, by traversed air-ducts below the mangers, for fresh air to be supplied to the horses while lying down. Above the horses' heads are windows which are arranged to open inwards, being hinged at the bottom and fitted with hopper cheeks to avoid direct draught. Ridge ventilation and skylights are given, so that all parts of the stable are well lighted and airy.

Cast-iron mangers and hay-racks are provided, and the horses are separated by rails, with chains to manger brackets and heel posts; saddle brackets are fixed to the heel posts. Each stable has a troop store, where spare saddles and gear are kept; also an expense forage store, in which the day's ration, after issue in bulk from the forage barn, is kept until it is given out in feeds. The stables are paved with blue Staffordshire paving bricks, graded to a collecting channel carrying the drainage well clear of the building, before it is taken into a gully.

The space between the blocks of stables is paved with cement concrete to form a yard, and horse-troughs, litter-sheds and dung-pits are provided. Officers' stables are built in separate blocks, and usually have only one row of stalls; the stalls are divided by partitions, and separate saddle-rooms are provided. Stalls and loose boxes in infirmary stables give 2,000 cub. ft. of air space per horse and are placed at some distance from the troop stables in a separate enclosure. A forge and shoeing shed is provided in a detached block near the troop stables. A forage barn and granary is usually built to hold a fortnight's supply, and a chaff-cutter driven by horse power is fixed close by. Cavalry regiments each have a large covered riding school, and a number of open manege, for exercise and riding instruction.

Artillery, &c.—The accommodation provided for horse and field artillery is arranged to suit their organization in batteries and brigades, and is generally similar to that already described, with the addition of vehicle sheds for guns and ammunition wagons, and special shops for wheelers and saddlers. Accommodation for other units follows the general lines already laid down, but has to be arranged to suit the particular organization and requirements of each unit.

Garrison Accessories.—In every large military station in addition to the regimental buildings which have been described, a number of buildings and works are required for the service of the garrison generally. Military hospitals are established at home and abroad for the treatment of sick officers and soldiers as well as their wives and families. Military hospitals are classified as follows:—First-grade hospitals are large central hospitals serving important districts. These hospitals are complete in themselves and fully equipped for the carrying out of operations of all kinds; they generally contain wards for officers, and may have attached to them separate isolation hospitals for the treatment of infectious cases, and military families' hospitals for women and children. Second-grade hospitals are smaller in size and less fully equipped, but are capable of acting independently and have operation rooms. Third-grade hospitals or reception stations are required for small stations principally, to act as feeders to the large hospitals, and to deal with accident and non-transportable cases. The principles of construction of military hospitals do not differ materially from the best modern civil practice; all are now built on the pavilion system with connecting corridors arranged so as to interface as little as possible with the free circulation of air between the blocks. The site is carefully selected and enclosed with railings. The administration block
is centrally placed, with ward blocks on each side, and accessory buildings placed where most convenient; the isolation wards are in a retired position and divided off from the hospital enclosure. Ward blocks usually have two storeys, and the ordinary large wards provide 1,200 cub. ft. of air space per patient. A due proportion of special case and other special wards is arranged in which the space per patient is greater or less, as necessary.

Army schools are built to give slightly more liberal accommodation than is laid down as the minimum by the Board of Education, but the principles of planning are much the same as in civil elementary schools. Schools are usually placed between the married quarters and the barracks, so as to serve both for the instruction of the men, when working for educational certificates, and for the education of the children of the married soldiers. Garrison churches are built when arrangements for the troops to attend divine service at neighbouring places of worship cannot well be made. Only two military prisons now remain, viz. Dover and Curragh, and these are for soldiers discharged from the service with ignominy. For ordinary sentences detention barracks and branch detention barracks are attached to the military commands and districts: these are constructed in accordance with the home office regulations; but crime in the army fortunately continues to decrease, and little accommodation has recently been added. Barrack expense stores for the issue of bedding, utensils and other stores for which the troops depend upon the Army Service Corps, are necessary in all barracks; and in large stations a supply depot for the issue of provisions, with abattoir and bakery attached to it, may be necessary. An engineer office with buildings yard and workshops to deal with the ordinary duties in connexion with the upkeep of War Department property is required at every station, and for large stations such as Aldershot, it may be necessary to undertake special water supply schemes, works for disposal of sewage, and for the supply of electricity or gas for lighting the barracks. The system of roads, pipes and mains within the barracks are in all cases maintained by the Royal Engineers, as well as the buildings themselves. District and brigade offices are necessary for the administration of large units, and quarters for the general officer commanding and the headquarters staff may sometimes be required.

Location of Barracks.—The selection of a healthy site for a barrack building or new military station is a matter of great importance. In the earlier days of barrack construction, barracks were, for political reasons, usually built in large towns, where troops would be at hand for putting down disturbances, and cramped and inconvenient buildings of many storeys, were erected on a small piece of ground often surrounded by the worst slums of the city: such, for example, were the Ship Street barracks in Dublin, and the cavalry barracks at Hulme, Manchester. Worse still were cases where an existing building, such as the Linen Hall in Dublin, was purchased, and converted into barracks with little regard for the convenience of the occupants, and a total disregard for the need of a free circulation of pure air in and about the buildings, which is the first condition of health. In the present day, except in a few cases where strong local influence is allowed to prevail to retain troops in towns, where their presence, and perhaps the money they spend, are appreciated for patriotic or other motives, every opportunity is taken to move troops from the vicinity of crowded towns, and quarter them in barracks or huts built in the open country. Due regard can then be given to sanitary location, and military training can more effectively be carried out. With improvements in communication by rail, road and telegraph, support to the civil power in case of disturbance can always be afforded in good time, without permanently stationing troops in the actual locality where their assistance may be needed. It has been recognized ever since the Crimean War, that the leading principle of barrack policy must, in the future, be to facilitate in peace time the training of the army for war, and that this can only be done by quartering troops in large bodies, including all branches of the service, in positions where they have space for training, gun and rifle practice, and manoeuvring. The camps at Aldershot, Colchester, Shorncliffe and Curragh were accordingly started between 1856 and 1860, and the same policy has since been continued by the acquisition of Strensall Common, near York, Kilworth domain, near Fermoy, the lease of a portion of Dartmoor and a large area at Glen Imaal in Co. Wicklow, and the purchase of the Stobs estate in Scotland and of a large part of Salisbury Plain.

Barrack Construction.—The history of barrack construction in Great Britain is an interesting study, but can only be touched on briefly. As long as operations in the field were carried on by troops levied especially for the war in hand, no barracks apart from fortifications were required, except those for the royal bodyguard; and even after the standing army exceeded those limits, the necessity for additional barracks was often avoided by having recourse to the device of billeting, i.e. quartering the soldiers on the populations of the towns where they were posted. This, however, was a device burdensome to the people, subversive of discipline, and prejudicial to military efficiency in many ways, while it exposed the scattered soldiers to many dangers from disloyalty. Hence barracks were gradually provided, at first in barracks where some engagement was most necessary owing to the paucity of the population, or concentration of troops was most important, owing to the disaffection of some of the inhabitants. The earliest barracks of which there is any record as regards England, were those for the foot guards, erected in 1660. Among the earliest of those still existing are the Royal Barracks at Dublin, dating from 1700, and during the 18th century barracks were built in several parts of Ireland; but in England it was at the end of the 18th and beginning of the 19th century that most of the earlier barracks were constructed. So long as barracks were mainly in connexion with fortresses their construction naturally fell to the duty of the King's Engineers, afterwards the Corps of Engineers, working under the master-general of the ordnance. About 1796, however, a special civil department was formed under the commissioners for the affairs of barracks, to deal with barracks apart from fortifications. In 1816 we find a warrant appointing a civilian comptroller of the barrack department to deal with the erection and upkeep of barracks and barrack hospitals not within fortified places. This warrant gave the first intimation of the nature of accommodation provided, and a few extracts from it are worth notice. No definite regulations as to cubic or floor space per man are laid down; but in the infantry, twelve men, and in the cavalry, eight men are allotted to one room. "Bed- steads or berths" are allowed, "a single one to each man, or a double one to two men," or "hammocks where necessary." The married soldier's wife is barely recognised, as shown by the following extract:—"The comptroller of the barrack department may, if he sees fit, and when in no shape interferes with or straitens the accommodation of the men, permit (as an occasional indulgence, and as tending to promote cleanliness, and the convenience of the soldier) four married women per troop or company of sixty men, and six per troop or company of a hundred men, to be resident within the barracks; but no one article shall on this account be furnished by the barrack-masters, upon any consideration whatever. And if the barrack-masters perceive any mischief, or damage, arises from such indulgence, the comptroller shall, on their representation, displace such women. Nor shall any dogs be suffered to be kept in the rooms of any barrack or hospital." Another regulation says: "Where kitchens are provided for the soldiers, they shall not be allowed to dress their provisions in any other places." In about 1818 the civil barrack department was abolished on account of abuses which had grown up, and the duke of Wellington as master-general of the ordnance and commander-in-chief transferred to the corps of Royal Engineers the duties of construction and maintenance of barracks. In 1826 a course of practical architecture was started at the school of military engineering at Chatham under Lieutenant-Colonel (afterwards Sir Charles) Pasley, the first commandant of the school, who himself wrote an outline of the course. Wellington interested himself in the
BARRACKS

barrack question, and under his orders single iron bedsteads were substituted for the wooden berths, two tiers high, in which two men slept in the same bed, then a certain cubical space per man was allotted, and cook-houses and ablution-rooms were added. Next, sergeants’ messes were started, and ball courts allowed for the recreation of the men. It was not, however, till after the Crimean War that public attention was directed by the report dated 1857 of the royal commission on the sanitary state of the army, to the high death-rate, and certain sanitary defects in barracks and hospitals, such as overcrowding, defective ventilation, bad drainage and insufficient means of cooking and cleanliness, to which this excessive mortality was among other causes assigned.

In 1857 a commission appointed for improving the sanitary condition of barracks and hospitals made an exhaustive inspection of the barracks in the United Kingdom, and reported in 1861. This was followed by similar commissions to examine the barracks in the Mediterranean stations and in India. These commissions, besides making valuable recommendations for the improvement of almost every barrack inspected by them, laid down the general sanitary principles applicable to the arrangement and construction of military barracks and hospitals; and in spite of the lapse of time, the reports repay close study by all who are interested in sanitary science as applied to the construction and improvement of such buildings. The names of Sidney Herbert (afterwards Lord Herbert of Lea), Captain (afterwards Sir Douglas) Galton, R.E., and John Sutherland, M.D., stand out prominently among those who contributed to the work. The commission was constituted a standing body in 1862, and continues its work to the present day, under the name of the Army Sanitary Committee, which advises the secretary of state for war on all sites new barracks or hospitals, also upon type plans, especially as to sanitary details, and principles of sanitary construction and fitments. A definite standard of accommodation was laid down, which formed the basis of the first issue of the Barrack Synopsis in 1865. A general order dated 1845 had directed that a space of 450 to 500 cub. ft. per man should be provided in all new barracks at home stations; but this had not been applied in existing barracks or buildings appropriated as such, and when detailed examination was made, it was found that some men had actually less than 250 cub. ft., and out of accommodation for nominally 76,813 soldiers, 2003 only had 600 cubic feet. This conclusion was followed up by the royal commission of 1857. To give every soldier his allotted amount of 600 cub. ft., meant a reduction in accommodation of the barracks by nearly one-third the number. Many buildings were condemned as being entirely unsuitable for use as barracks; in other cases improvements were possible by alterations to buildings and opening-up of sites. Ventilation of the rooms was greatly improved, cook-houses, ablution-rooms and sanitary accessories were carefully examined and a proper scale laid down. Separate quarters for the married soldiers did not exist in many barracks, and in some instances married men’s beds were found in the men’s barrack-rooms without even a screen to separate them; in other cases, married people were accommodated together in a barrack-room, with only a blanket hung on a cord as a screen between the different families. The recommendations of the committee resulted in a single room being allotted to all married soldiers, and this accommodation has gradually improved up to the comfortable cottage now provided.

From the time of this first thorough inquiry into barrack accommodation, steady and systematic progress has been made. Although lack of funds has always hampered rapid progress, and keeps the accommodation actually existing below the standard aimed at, much has been done to improve the soldiers’ condition in this respect. Numerous regimental depots and other barracks were built under the Military Forces Localization Act of 1872. The Barracks Act of 1890 replaced the worn-out huts at Aldershot, Colchester, Shorncliffe and Curragh by convenient and sanitary permanent buildings, and further additions and improvements have been made under the Military Works Acts of 1897, 1899 and 1901. As some evidence of the practical result of the care and money that has been expended on this work, it is interesting to note that while, in 1857, the annual rate of mortality in the army at home per 1000 men was 17.5 (compared with 9.2 for the civil male population of corresponding age), forty years later, in 1897, the rate of mortality in the army was only 3.42 per 1000. No doubt, improved barrack accommodation contributed greatly to this result. Barrack construction work remained in the hands of the Corps of Royal Engineers until 1904, when a civil department was again formed under an architect styled “director of barrack construction,” to deal with the construction of barracks at home stations, and the construction and maintenance of military hospitals.

**British Colonial.**—Barracks at colonial stations are governed by the general scale of accommodation in the Barrack Synopsis, modified according to the climate of the station, in the direction of increase in floor area and height of rooms. In the planning of rooms for occupation in tropical or sub-tropical countries provision has to be made for the freest possible circulation of air through the buildings. The walls have to be protected by verandas from the direct rays of the sun, and the special local domestic arrangements have to be taken into consideration. For example, in hot countries it is usually undesirable to have kitchens directly attached to the dwelling-houses, sanitary arrangements and the methods adopted, and in some cases it is necessary to provide a forced circulation of air below the ground floors of all inhabited buildings by raising them off the ground some 4 ft. The aspect of the buildings will usually be arranged so as to catch the prevailing wind, and the mode of construction varies greatly according to the custom and resources of the country.

**Indian Barracks.**—In India, barracks for the British troops are built by the Royal Engineer officers detailed for military work duties, assisted by military foremen, who pass through the civil engineering colleges, and by a native subordinate staff. The scale of accommodation to be provided is laid down in the Indian army regulations, and is for the private soldier more liberal than is allowed by the home government for any of the colonial stations. The barracks-rooms are lofty and airy, with verandas all round, and clerestory windows. Roofs are usually of double tiling. The allowance of space is 90 sq. ft. per man in rooms 16 ft. high, with, in addition, a day room adjoining for the use of the men for their meals or as a sitting-room. Recreation establishments are provided; and means of recreation, such as bowling and skittle alleys, the law courts, plunge baths and cricket grounds, are given. Separate blocks for the married quarters are provided, and schools for the children. Hospital accommodation on a higher scale than at home is necessary; but all sanatoria have in recent years done much to improve the health of the troops by giving change of air, during the hot weather, to a large proportion of the men and families. Piped water supplies have replaced the old wells at many stations, and attention is being directed to improved cooking and sanitary arrangements.

**Naval Barracks.**—In recent years, large naval barracks have been built, notably at Portsmouth, Chatham and Devonport. These differ from military barracks principally in that they keep up the system of board-ship life to which the men are accustomed. Large barrack-rooms are provided with caulked floors like ships’ decks, and have rows of hammocks slung across them; these are stowed in the day-time, when the rooms are used as mess-rooms. Ablution and sanitary arrangements are grouped together on the basement floors. Fine recreation establishments and canteens are also provided. The officers’ messes have splendid public rooms, but the officers’ quarters are not so large as in military barracks, though no doubt spacious to the naval officer, accustomed as he is to a small cabin. Married quarters for the men are not provided except in connexion with coastguard stations.

**Other Countries.**—A great number of the German and French barracks are erected in the form of a large block of three or four storeys containing all the accommodation and accessories for officers, married and single non-commissioned officers and men, of a complete battalion or regiment in one building. Some of the
modern barracks, however, are arranged more on the pavilion system with separate blocks; but the single block system is well liked on account of its compactness and the facility it gives for supervision; it is also more satisfactory from the architectural point of view. The system of allotment and arrangement of accommodation for these two great armies does not differ much, except in detail, from that adopted by the British army. The floor and cubic space allotted per man is a little less; accommodation for officers is not usually provided, except to a limited extent, unless the barracks are on a country site. The German army, however, now provides every regiment with a fine officers' mess-house furnished at the public expense. Married quarters for some of the non-commissioned officers are provided, but not for privates. American barracks are interesting, as providing for perhaps a higher class of recruit than usual; they are well designed and superior finish internally is given. The barracks are arranged usually on the separate block system, and centre round a post-exchange or soldiers' club, which is a combined recreation establishment, gymnasium and sergeants' mess, with bath-house attached. Canteens for the sale of liquor were abolished in 1901.

See T. Barron, Synopsis (1905); The Handbook of Signal and Communication (1895); Military Buildings (1905); The Army Regulations, (E. N.S."

BARRANDE, JOACHIM (1799—1883), Austrian geologist and palaeontologist, was born at Saugues, Haute Loire, on the 11th of August 1809, and educated in the École Polytechnique at Paris. Although he had received the training of an engineer, his first appointment was that of tutor to the duc de Bordeaux (afterwards known as the comte de Chambord), grandson of Charles X., and when the king abdicated in 1830, Barrande accompanied the royal exiles to England and Scotland, and afterwards to Prague. Settling in that city in 1831, he became occupied in engineering works, and his attention was then attracted to the fossils from the Lower Palaeozoic rocks of Bohemia. The publication in 1839 of Murchison's Silurian System incited Barrande to carry on systematic researches on the equivalent strata in Bohemia. For ten years (1840—1850) he made a detailed study of these rocks, engaging workmen specially to collect fossils, and in this way he obtained upwards of 3500 species of gastropods, brachiopods, mollusca, crustacea (particularly trilobites) and fishes. The first volume of his great work, Système siluriens du centre de la Bohême (dealing with trilobites), appeared in 1852; and from that date until 1881, he issued twenty-one quarto volumes of text and plates. Two other volumes were issued after his death in 1887 and 1894. It is estimated that he spent nearly £10,000 on these works. In addition he published a large number of separate papers. In recognition of his important researches the Geological Society of London in 1855 awarded him the Wollaston medal.

The term Silurian was employed by Barrande, after Murchison, in a more comprehensive sense than was justified by subsequent knowledge. Thus the Silurian rocks of Bohemia were divided into certain stages (A to H)—the two lowermost, A and B without fossils (Azoic), succeeded by the third stage, C, which included the primordial zone, since recognized as part of the Cambrian of Sedgwick. The fourth stage (Étage D), the true lower Silurian, was described by Barrande as including isolated patches of strata with organic remains like those of the Upper Silurian. These assemblages of fossils were designated "Colonies," and regarded as evidence of the early introduction into the area of species from neighbouring districts, that became locally extinct, and reappeared in later stages. The interpretation of Barrande was questioned in 1854 by Edward Forbes, who pointed to the disturbances, overturns and cumplings in the older rocks as affording a more reasonable explanation of the occurrence of strata with newer fossils amid those containing older ones. Other geologists subsequently questioned the doctrine of "Colonies." In 1880 Dr J. E. Marr, from a personal study in the field, brought forward evidence to show that the repetitions of the fossiliferous strata on which the "Colonies" were based were due to faults. The later stages of Barrande, F, G and H, have since been shown by Emanuel Friedrich Heinrich Kayser (b. 1845) to be Devonian.

Despite these modifications in the original groupings of the strata, it is recognized that Barrande "made Bohemia classic ground for the study of the oldest fossiliferous formations." He died at Frohseon on the 31st of October 1883.

BARRANQUILLA, a city and port of Colombia, South America, capital of a province of the same name in the department of Atlantico, on the left bank of the Magdalena river about 7 m. above its mouth and 18½ m. by rail from its seaport, Puerto Colombia. Pop. (est. 1902) 31,000. Owing to a dangerous bar at the mouth of the Magdalena the trade of the extensive territory tributary to that river, which is about 60% of that of the entire country, must pass in great part through Barranquilla and its seaport, making it the principal commercial centre of the republic. Savanilla was used as a seaport until about 1890, when shoals caused by drifting sands compelled a removal to Puerto Colombia, a short distance westward, where a steel pier, 400 ft. in length, has been constructed to facilitate the handling of freight. The navigation of the Magdalena is carried on by means of light-draught steamers which ascend to Yeguas, 14 m. below Honda, where goods are transhipped by rail or by large canoes with small pack-animals to Botogó, or by smaller boats to points farther up the river. Barranquilla was originally founded in 1629, but attracted no attention as a commercial centre until about the middle of the 19th century, when efforts were initiated to secure the trade passing through Cartagena. The city is built on a low plain, is regularly laid out, and has many fine warehouses, public buildings and residences, but its greater part, however, consists of mud-walled cabins supported by bamboo (guadua) framework and thatched with rushes. The water-supply is drawn from the Magdalena, and the city is provided with telephone, electric light and tram services. Owing to periodic inundations, the surrounding country is but little cultivated, and the greater part of the population, which is of the mixed type common to the lowlands of Colombia, is engaged in no settled productive occupation.

BARRAS, PAUL FRANÇOIS NICOLAS, COMTE DE (1755—1839), member of the French Directory of 1795—1799, was descended from the family of Provence, and was born at Fox-Amphoux. At the age of sixteen he entered the regiment of Languedoc as "gentleman cadet," but embarked for India in 1776. After an adventurous voyage he reached Pondicherry and shared in the defence of that city, which ended in its capitulation to the British on the 18th of October 1778. The garrison being released, Barras returned to France. After taking part in a second expedition to the East Indies in 1782—1783, he left the army and occupied the following years with the frivolities congenial to his class and to his nature. At the outbreak of the Revolution in 1789, he espoused the democratic cause, and became one of the administrators of the department of the Var. In June 1792 he took his seat in the high national court at Orleans; and later in that year, on the outbreak of war with the kingdom of Sardinia, he became commissioner to the French army of Italy, and entered the Convention (the third of the national assemblies of France) as a deputy for the department of the Var. In January 1793 he voted with the majority for the death of Louis XVI. Much of his time, however, was spent in missions to the districts of the south-east of France; and in this way he made the acquaintance of Bonaparte at the siege of Toulon. As an example of the incorrectness of the Barras Memoirs we may note that the writer assigned 30,000 men to the royalist defending force, whereas it was less than 12,000; he also sought to minimize the share taken by Bonaparte in the capture of that city.

In 1794 Barras sided with the men who sought to overthrow the Robespierre faction, and their success in the coup d'état of 9 Thermidor (27th of July) brought him almost to the front rank. In the next year, when the Convention was threatened by the malcontent National Guards of Paris, it appointed Barras to command the troops engaged in its defence. His nomination of Bonaparte as one of his subalterns led to the adoption of vigorous measures, which ensured the dispersion of the royalists and
malcontents in the streets near the Tuileries, 13 Vendémiaire (5th of October 1793). Thereupon Barras became one of the five Directors who controlled the executive of the French republic. Owing to his intimate relations with Joséphine de Beauharnais, he helped to facilitate a marriage between her and Bonaparte; and many have averred, though of defective evidence, that Barras procured the appointment of Bonaparte to the command of the army of Italy early in the year 1796. The achievements of Napoleon gave to the Directory a stability which it would not otherwise have enjoyed; and when in the summer of 1797 the royalist and constitutional opposition again gathered strength, Bonaparte sent General Augereau (q.v.), a headstrong Jacobin, forcibly to repress that movement by what was known as the coup d'état of 18 Fructidor (4th September). Barras and the violent Jacobins now carried matters with so high a hand as to render the government of the Directory odious; and Bonaparte had no difficulty in overcoming it by the coup d'état of 18-19 Brumaire (9th-10th November). Barras saw the need of a change and was to some extent (how far will perhaps never be known) an accomplice in Bonaparte's designs, though he did not suspect the power and ambition of their contrivor. He was left on one side by the three Consuls who took the place of the five Directors and found his political career at an end. He had amassed a large fortune and spent his later years in voluptuous ease. Among the men of the Revolution few did more than Barras to degrade that movement. His immorality in both public and private life was notorious and contributed in no small degree to the downfall of the Directory, and with it of the first French Republic. Despite his profession of royalism in 1793 and after 1815, he remained more or less suspect to the Bourbons; and it was with some difficulty that the notes for his memoirs were saved from seizure on his death on the 29th of January 1829.

Barras left memoirs in a rough state to be drawn up by his literary executor, M. Rousseau de St Albin. The amount of alteration which they underwent at his hands is not fully known; but M. George Duruy, who edited them on their publication in 1895, has given fairly satisfactory proofs of their genuineness. For other sources respecting Barras see the Memoirs of Cogne, Larivière-Lépeaux and de Lescure; also Sciot, Le Directoire (4 vols., Paris, 1859—1897), A. Sorel, L'Europe et la Révolution française (esp. vols. V. and VI., 1903-1904), and A. Vandal, L'Apprenti de Bonaparte (Paris, 1902-1904). (J. H. R.)

BARRATRY (O. Fr. baroter, barter, to barter or cheat), in English criminal law, the offence (more usually called common barratry) of constantly inciting and stirring up quarrels in disturbance of the peace, either in courts or elsewhere. It is an offence both at common law and by statute, and is punishable by fine and imprisonment. By a statute of 1762, if the person guilty of common barratry belonged to the profession of the law, he was disabled from practising in the future. It is a cumulative offence, and it is necessary to prove at least three commissions of the act. For nearly two centuries there has been no record of an indictment having been preferred for the offence, but in 1889 a case occurred at the Guildford summer assizes, R. v. Bellrose (The Times, 8th July 1889). As, however, the defendant was convicted of another offence, the charge was not proceeded upon. (See Pollock and Maitland, History of English Law; Russell, Crimes and Misdemeanours; Stephen, Criminal Law.)

In marine insurance barratry is any kind of fraud committed upon the owner or insurers of a ship with a master with the intention of benefiting himself at their expense. Continental jurists give a wider meaning to barratry, as meaning any wilful act by the master or crew, by whatever motive induced, whereby the owners or charterers are defrauded. In bills of lading it is usual to except it from the shippers' liability (see AFFREIGHTMENT).

In Scotland, barratry is the crime committed by a judge who is induced by bribery to pronounce judgment.

BARRÉ, ISAAC (1726-1802), British soldier and politician, was born at Dublin in 1726, the son of a French refugee. He was educated at Trinity College, Dublin, entered the army, and in 1759 was with Wolfe at the taking of Quebec, on which occasion he was wounded in the cheek. His entry into parliament in 1761 under the auspices of Lord Shelburne, who had selected him "as a bravo to run down Mr Pitt," was characterized by a virulent attack on Pitt, of whom, however, he became ultimately a devoted adherent. A vigorous opponent of the American war and of the treaty of secrecy which Pitt had negotiated with the United States, he was one of the members of the committee to which the treaty was referred in 1784.

BARE, city of Washington county, Vermont, U.S.A., in the north central part of the state, about 6 m. S.E. of Montpelier. Pop. (1800) 4416; (1900) 8448, of whom 2831 were foreign-born; (1910, census) 10,734. It is served by the Central Vermont and the Montpelier & Wells River railways, and is connected by electric street railways with Montpelier. Barré is an important seat of the granite industry, and manufactures monuments and tombstones, stone-cutting implements and other machinery. In 1905 the city's factory products were valued at $5,573,646, of which 86.9% was the value of the monuments and tombstones manufactured. Among the leading enterprises are the Aldrich public library and Good Soldier School (1870; Universalist). There is a beautiful marble statue of Burns (by J. Massey Rhind), erected in 1809 by the Scotsmen of Barré. The water-works are owned and operated by the municipality. Settled soon after the close of the War of Independence, the township of Barré (pop. in 1790; 1894) was organized in 1793 and named in honour of Isaac Barré (1726-1802), a defender of American rights in the British parliament. The present city, chartered in 1894, was originally a part of the township.

BARREL (a word of uncertain origin common to Romance languages; the Celtic forms, as in the Gaelic barail, are derived from the English), a vessel of cylindrical shape, made of staves bound together by hoops, a cask; also a dry and liquid measure of capacity, varying with the commodity which it contains (see Weights and Measures). The term is applied to many cylindrical objects, as to the drum round which the barrel is wound in a crate, a capstan or a watch; to the cylinder stuffed with pins in a barrel-organ or musical-box; to the hollow shaft in which the piston of a pump works; or to the tube of a gun. The "barrel" of a horse is that part of the body lying between the shoulders and the quarters. For the system of vaulting in architecture known as "barrel-vaulting" see VAULT.

BARREL-ORGAN (Eng. "grinder-organ," "street-organ," "hand-organ," "Dutch organ"); Fr. orgue de Barbarie, orgue d'Allemagne, orgue mécanique, cabinet d'orgue, serenité; Ger. Drehorgel, Leierkasten; It. organetto a manovella, organo tedezo), a small portable organ mechanically played by turning a handle. The barrel-organ owes its name to the cylinder on which the tunes are pricked out with pins and staples of various lengths, set at definite intervals according to the scheme required by the music. The function of these pins and staples is to raise balanced keys connected by simple mechanism with the valves of the pipes, which are thus mechanically opened, admitting the stream of air from the wind-chest. The handle attached to the shaft sets the cylinder in slow rotation by means of a worm working in a fine-toothed gear on the barrel-head; the same motion works the bellows by means of cranks and connecting rods on the shaft. The wind is thereby forced into a reservoir, whence it passes into the wind-chest, on the sides of which are grouped the pipes. The barrel revolves slowly from back to front, each revolution as a rule playing one complete tune. A notch-pin in the barrel-head, furnished with as many notches as there are tunes, enables the performer to shift the barrel and change the tune. The ordinary street barrel-organ had a compass varying from 24 to 34 notes, forming a diatonic scale with a few accidentals, generally F#, G#, C#. There were usually two stops, one for the open pipes of metal, the other for the closed wooden pipes. Barrel-organ
have been made with as many as three or four cylinders set in a circular revolving frame, but these more elaborate instruments were mainly used in churches and chapels, a purpose for which they were in great demand for playing hymns, chants and voluntaries during the 18th and early 19th centuries. A barrel-organ was built for Fulham church by Wright, and a large instrument with four barrels was constructed by Bishop for Northallerton church in 1820.

The origin of the barrel-organ is now clearly established, and many will doubtless be surprised to find that it must be sought in the Netherlands as early as the middle of the 15th century, and that accurate and detailed diagrams of every part of the mechanism for a large stationary barrel-organ worked by hydraulic power were published in 1615. There are letters patent preserved in the archives of Belgium appointing a certain organ-builder, Jehan van Steeken, dit Aren, "Master of organs which play of themselves"; in the original Flemish Meezer van orgelen speLENDE bij hen selven. This organ was not a portable one like English street-organists, but a more imposing instrument, as we learn from other documents giving a detailed account of the moneys paid to Maistre Jehan for conveying the organs given to automatic contrivances of all kinds, carillons, clocks, speaking animals and other curiosities due to Flemish genius.

No contemporary illustration is forthcoming, but in 1615 Solomon de Caus, who avowedly owed his inspiration to Hero and Vitruvius, describes a number of hydraulic machines, amongst which is the barrel-organ, illustrating his description by means of several large drawings and diagrams very carefully carried out. De Caus' organ, entitled "Machine par laquelle l'on fera sonner un jeu d'orgues par le moyen de l'eau," was built up on a wall a foot thick. In the illustrations the barrel is shown to be divided into bars, and each bar into eight beats for the quavers. The whole drum is pierced with holes at the intersecting points, the pins being movable, so that when the performer grew tired of one tune, he could re-arrange the pins to form another. The four bellows are set in motion by means of ropes strained over pulleys and attached to four cranks on the rotating shaft. Solomon de Caus lays no claim to the invention of this organ, but only to the adaptation of hydraulic power for reviving the drum; on the contrary, in a dissertation on the invention of hydraulic machines and organs, he states that there was evidently some evidence between the organs of the ancients and those of his day, since there is no mention in the classics of any musical instrument so far as we know other than organs of which tunes could be played in several parts—the ancient, indeed, seem to have used their fingers on the keyboard to sound their organs. The eighteen keys drawn in one diagram bear names, beginning at the left, D, C, B, A, G, F, E, D, C, B; De Caus states that only half the keyboard is given for want of space; the compass, therefore, probably was as shown, with a few accidentals. A barrel-organ, also worked by hydraulic power, is somewhat fantastically drawn by Robert Fludd in a work published two years after that of Solomon de Caus. This diagram is of no value except as a curiosity, for the author betrays a very imperfect knowledge of the mechanical principles involved. The piece of music actually set on de Caus' barrel-organ, six bars of which can be made out, consists of a madrigal, "Chi fara fed' al ciel," by Alessandro Striggio, written in organ tablature by Peter Philips, organist of the Chapel Royal, Brussels, at the end of the 16th century. A French barrel-organ to the collection of the Brussels Conservatoire, bearing the date "5 Mars 1797," has the following compass with flats, beginning at the left:

Other evidence of the origin of the barrel-organ are wanting. The inventory of the organs and other keyboard instruments belonging to the duke of Modena, drawn up in 1568, contains two entries of an organo Tedesco. In England these organs were also known as "Dutch organs," and the name clung to the instrument even in its diminutive form of hand-organ of the itinerant musician. In Jedediah Morse's description of the

[Image: attachment:image.jpg]
manners and customs of the Netherlands, we find the following allusion:—"The diversions of the Dutch differ not much from those of the English, who seem to have borrowed from them the neatness of their drinking booths, skittle and other grounds... which form the amusements of the middle ranks, not to mention their hand-organs and other musical instruments," 1 An illustration of the hand-organ of the period is given in Knight’s London, 2 being one of a collection of street views published by Dayes in 1789. In a description of Bartholomew Fair, as held at the beginning of the 18th century, is a further reference to the Dutch origin of the barrel-organ:—"A band at the west-end of the town, well known for playing on winter evenings before Spring Garden Coffee House, opposite Wigley’s great exhibition room, consisted of a double drum, a Dutch organ, the tambourine, violin, pipes and the ‘Turkish jingle used in the army. This band was generally hired at one of the booths of the fair." 3

Mr. Thomas Brown relates that one Mr. Stephens, a Poultry author, proposed to parliament for any one that should presume to keep an organ in a Publick House to be fined £20 and made incapable of being an ale-draper for the future. 4 In 1757 Horace Walpole writes—"I am now in pursuit of getting the finest piece of music that ever was heard; it is a thing that will play eight tunes. Handel and all the great musicians say that it is beyond anything they can do, and this may be performed by the most ignorant person, and when you are weary of those eight tunes, you may have them changed for any other that you like." The organ was put in a lottery and fetched £200. There was a very small barrel-organ in use during the 18th and 19th centuries, known as the bird-organ (Fr. sérinette, turulaitane, merline). One of these now in the collection of the Brussels Conservatoire is described by V. C. Mahillon. 5 The instrument is in the form of a book, on the back of which is the title "Le chant des oiseaux, Tome vi." There are ten pewter stopped pipes giving the scale of G with the addition of Fb and A two octaves higher. The whole instrument measures approximately 8×3½×2½in. and plays eight tunes. Mozart wrote an Andante 7 for a small barrel-organ.

For an illustration of the construction of the barrel-organ during the 18th century, consult P. M. D. J. Engramelle, La Tontenohce ou l’art de noter les cylindres et tout qui est susceptible de notation dans ce genre (Paris, 1797); and see also the engravings (not in the British Museum); and for a clear diagram of the modern instrument the article on "Automatic Apparatus connected with Music," by Dr. E. J. Hopkins, in Grove’s Dictionary of Music and Musicians, vol. i. (1904), p. 134.

BARREN ISLAND, a volcanic island in the Bay of Bengal. It has an irregularly circular form of about 2 m. in diameter, composed of an outer rim rising to a height of from 700 to 1000 ft., with a central cone the altitude of which is 1015 ft. This cone rises from a depth of 500 fathoms below the sea. It was active between 1789 and 1832, but has since been dormant.

BARRÉS, MAURICE (1852–1923), French novelist and politician, was born at Charnes (Vosges) on the 22nd of September 1852; he was educated at the Lycee of Nancy, and in 1883 went to Paris to continue his legal studies. He was already a contributor to the monthly periodical, Jeune France, and he now issued a periodical of his own, Les Taches d’encre, which survived for a few months only. After four years of journalism he went to Italy, where he wrote Sous l’aile des barbares (1888), the first volume of a trilogie du moi, completed by Un Homme libre (1889), and Le Jardin de Bérénice (1891). He divided the world into moi and the barbarians, the latter including all those anti-pathetic to the writer’s individuality. These apologies for individualism were supplemented by L’Ennemi des lois (1892), and an admirable volume of impressions of travel, Du song, de la solitude et de la mort (1903). His early books are written in an elaborate style and are often very obscure. Barrès carried his theory of individualism into politics as an ardent partisan of General Boulanger. He directed a Boulangerist paper at Nancy, and was elected deputy in 1889, retaining his seat in the legislature until 1893. His play, Une Journée parlementaire, was produced at the Comédie Française in 1894. In 1897 he began his trilogy, Le Roman de l’énergie nationale, with the publication of Les Déracinés. The series is a plea for local patriotism, and for the preservation of the old French provinces. The first narrates the adventures of seven young Lorrainers, who set out to conquer fortune in Paris. Six of them survive in the second novel of the trilogy, L’Appel au soldat (1900), which gives the history of Boulangerism; the sequel, Leurs figures (1902), deals with the Panama scandals. Later works are—Scènes et doctrines du nationalisme (1903); Les Amitiés françaises (1903), in which he urges the inculcation of patriotism by the early study of national history; Ce que j’ai vu à Rennes (1904); Au service de l’Allemagne (1905), the experiences of an Alsatian conscript in a German regiment; Le Voyage de Sporte (1906). M. Barrès was admitted to the French Academy in 1906.

K. D. O. MAURICE (1896); J. Lionnet, L’Évolution des idées (1903); Anatole France, La Vie littéraire (4th series, 1892).

BARRETT, LAWRENCE (1838–1891), American actor, was born of Irish parents in Paterson, New Jersey, on the 4th of April 1838. His family name was Brannigan. He made his first stage appearance at Detroit as Murad in The French Spy in 1853. In December 1856 he made his first New York appearance at the Chambers Street theatre as Sir Thomas Clifford in The Handcuff. In 1858 he was in the stock company at the Boston Museum. He served with distinction in the Civil War as captain in the 28th Massachusetts infantry regiment. From 1857 to 1870, with John McCullough, he managed the California theatre, San Francisco. Among his many and varied parts may be mentioned Hamlet, Lear, Macbeth, Shylock, Richard III., Wolsey, Benedick, Richelieu, David Garrick, Hernani, Alfred Evelyn, Lancioto in George Henry Boker’s (1823–1890) Francesca da Rimini, and James Harebell in The Man o’ Art. He played Othello to Booth’s Iago and Cassius to his Brutus. He acted in London in 1867, 1881, 1893 and 1894, as Richelieu in Machard, and Lytton’s King Charles, and continued his most brilliant role. He wrote a life of Edwin Forrest in the American Actors Series (Boston, 1881), and an admirable sketch of Edwin Booth in Edwin Booth and his Contemporaries (Boston, 1886). He died on the 20th of March 1891.

BARRETT, LUCAS (1837–1892), English naturalist and geologist, was born in London on the 14th of November 1837, and educated at University College school and at Ebersford. In 1855 he accompanied R. McAndrew on a dredging excursion from the Shetlands to Norway and beyond the Arctic Circle; and subsequently made other cruises to Greenland and to the coast of Spain. These expeditions laid the foundations of an extensive knowledge of the distribution of marine life. In 1855 he was engaged by Sedgwick to assist in the Woodwardian Museum at Cambridge, and during the following three years he aided the professor by delivering lectures. He discovered bones of birds in the Cambridge Greensand, and he also prepared a geological map of Cambridge on the one-inch Ordnance map. In 1859, when twenty-two years of age, he was appointed director of the Geological Survey of Jamaica. He there determined the Cretaceous age of certain rocks which contained Hippurites, the new genus Barretella being named after him by S. P. Woodward; he also obtained many fossils from the Miocene and newer strata. He was drowned at the early age of twenty-five, on the 18th of December 1862, while investigating the sea-bottom off Kingston, Jamaica.

Obituary by S. P. Woodward in Geologist (Feb. 1863), p. 60.

BARRETT, WILSON (1846–1904), English actor, manager and playwright, was born in Essex on the 18th of February 1846, the
son of a farmer. He made his first appearance on the stage at Halifax in 1864, and then played in the provinces alone and with his wife, Caroline Heath, in East Lynne. After managerial experiences at Leeds and elsewhere, in 1870 he took the management of the old Court theatre, where he introduced Madame Modjeska to London, in an adaptation of Schiller's Maria Stuart, Adrienne Lecouvreur, La Dame aux camélias, and other plays. It was not till 1881, however, when he took the Princess's theatre, that he became well known to the public in the emotional drama, The Lights of London, by G. R. Sims. The play which made him an established favourite was The Silver King by Henry Arthur Jones, perhaps the most successful melodrama ever staged, produced in 1882 with himself as Wilfred Denver, his brother George (an excellent comedian) in the cast, and E. S. Willard (b. 1853) as the "Spider,"—this being the part in which Mr Willard, afterwards a well-known actor both in America and England, first came to the front. Barrett played this part for three hundred nights without a break, and repeated his London success in W. G. Will's Claudian which followed. In 1884, he appeared in Hamlet, but soon returned to melodrama, and though he had occasional seasons in London he acted chiefly in the provinces. In 1886 he made his first visit to America, repeated in later years, and in 1898 he visited Australia. During these years the London stage was beginning to take a new influence, and Wills's melodrama had waned. But in 1895 he struck a new vein of success with his drama of religious emotion, The Song of the Cross, which crowded his theatre with audiences largely composed of people outside the ordinary circle of playgoers. He attempted to repeat the success with other plays of a religious type, but not with equal effect, and several of his later plays were failures. He died on the 22nd of July 1904. Wilson Barrett was a sterling actor of a robust type and striking physique, not remarkable for intellectual finesse, but excelling in melodrama, and very successful as the central figure on his own stage.

BARRHEAD, a police burgh of Renfrewshire, Scotland, situated on the Levern, 74 m. S.W. of Glasgow by the Glasgow & South-Western railway. Pop. (1901) 9,855. Founded in 1773, it has gradually absorbed the villages of Arthurlie, Dovecoath and Grahamston, and become a thriving town. The chief industries include bleaching, calico-printing, cotton-spinning, weaving, iron and brass founding, engineering and the manufacture of sanitary appliances, breeches and field work, and chemicals, and 2 m. N. E. lie Hurlet, where are important manufactories of alum and other chemicals, and Nitshill (pop. 1242) with chemical works, quarries and collieries.

BARRICADE, or BARRICADO (from the Span. barricado, from barricca, a cask, casks filled with earth having been early used to form barricades), an improvised fortification of earth, paving-stones, trees or any materials ready to hand, thrown up, especially across a street, to hinder the advance of an army; in the old wooden warships a fence or wooden rail, supported by stanchions and strengthened by various materials, extending across the quarter-deck as a protection during action.

BARRIE, JAMES MATTHEW (1860-__), British novelist and dramatist, was born at Kirriemuir, a small village in Forfarshire, on the 9th of May 1860. He was educated at the Dumfries academy and Edinburgh University. He has told us in his quasi-autobiographical Margaret Ogilvy that he wrote tales in the garret before he went to school, and at Edinburgh wrote the greater part of a three-volume novel, which a publisher presumed was the work of a clever lady and offered to publish for £100. The offer was not accepted, and it was through journalism that he found his way to literature. After a short period of waiting in Edinburgh, he became leader-writer on the Nottingham Journal in February 1883. To this paper he contributed also special articles and notes, which provided an opening and training for his personal talent. He soon began to submit articles to London editors, and on the 17th of November 1884 Mr Frederick Greenwood printed in the St James's Gazette his article on "An Auld Licht Community." With the encouragement of this able editor, more Auld Licht "Idylls" followed; and in 1885 Mr Barrie moved to London. He continued to write for the St James's Gazette and for Home Chimes (edited by Mr F. W. Robinson). He was soon enlisted by Mr Alexander Rieach for the Edinburgh Evening Dispatch, which in turn led to his writing (over the signature "Gavin Ogilvy") for Dr Robertson Nicoll's British Weekly. Later he became a contributor to the Scots (afterwards National) Observer, edited by W. E. Henley, and also to the Speaker, upon its foundation in 1890. In 1888 he published his first book, Better Dead. It was a mere jeu d'esprit, a specimen of his humorous journalism, elaborated from the St James's Gazette. This was followed in 1888 by Auld Licht Idyls, a collection of the Scots village sketches written for the same paper. They portrayed the life and humour of his native village, idealized as "Thurms," and were the fruits of early observation and of his mother's tales. "She told me everything," Mr Barrie has written, "and so my memories of our little red town were coloured by her memories." Kirriemuir itself was not wholly satisfied with the portrait, but "Thurms" took its place securely on the literary map of the world. In the same year he published An Edinburgh Eleven, sketches from the British Weekly of eminent Edinburgh students; also his first long story, Mary Rose, a humorous transposition of his experiences as journalist, particularly in the Nottingham office. The book was introduced by what was in fact another Thurms "Idyll," on a higher level than the rest of the book. In 1890 came A Window in Thurns. This beautiful book, and the Idylls, gave the full measure of Mr Barrie's gifts of humanity, humour and pathos, with abundant evidence of the whimsical turn of his wit, and of his original and vernacular style. In 1891 he made a collection of his lighter papers from the St James's Gazette and published them as My Lady Nicotine. In 1891 appeared his first long novel, The Little Minister, which had been first published serially in Good Words. It introduced, not with unmixed success, extraneous elements, including the winsome heroine Babbie, into the familiar life of Thurns, but proved the author's possession of a considerable gift of romance. In 1894 he published Margaret Ogilvy, based on the life of his mother and his own relations with her, most tenderly conceived and beautifully written, though too intimate for the taste of many. The book is full of revelations of great interest to all who knew Mr Barrie's genius. The following year, under the title of Sentimental Tommy, a novel, the psychological development of the "artistic temperament" in a Scots lad of the people. R. L. Stevenson supposed himself to be portrayed in the hero, but it may be safely assumed that the author derived his material largely from introspection. The story was completed by a sequel, Tommy and Grian, published in 1900. The effect of this story was somewhat marred by the comparative failure of the scenes in society remote from Thurns. In 1902 he published The Little White Bird, a pretty fantasy, wherein he gave full play to his whimsical invention, and his tenderness for child life, which is relieved by the genius of sincerity from a suspicion of mawkishness. This book contained the episode of "Peter Pan," which afterwards suggested the play of that name. In the meantime Mr Barrie had been developing his talent as a dramatist. In 1892 Mr Toole had made a great success at his own theatre of Barrie's Walker, London, a farce founded on a sketch in When a Man's Single. In 1893 Mr Barrie married Miss Ansell (divorced in 1909), who had acted in Walker, London. In this year he wrote, with Sir A. Conan Doyle, a play called Jane Ann. He found more success, however, in The Professor's Love-Story in 1895; and in 1897 the popularity of his dramatized version of The Little Minister probably confirmed him in a predilection for drama, evident already in some of his first sketches in the Nottingham Journal. In 1900 Mr Bourchier produced The Wedding Guest, which was printed as a supplement to the Fortnightly Review in December of the same year. After the publication of The Little White Bird, Mr Barrie burst upon the town as a popular and prolific playwright. The struggling journalist of the early 'nineties had now become one of the most prosperous literary men of the day. In 1903 no fewer than three plays from his hand held the stage—Quality Street, The Admirable...
Crichton and Little Mary. The year 1904 produced Peter Pan, a kind of poetical pantomime, in which the author found scope for some of his most characteristic and permanently delightful gifts. In 1905 Alice-Sit-by-the-Fire and in 1908 The Admirable Crichton were added to the list. As dramatist Mr Barrie brought, to a sphere rather ridden by convention, a method wholly unconventional and a singularly fresh fancy, seasoned by a shrud touch of satirical humour; and in Peter Pan he proved himself a Hans Andersen of the stage. In literature, the success of "Thrushes" produced a crop of imitations, christened in derision by W. E. Henley the "Kailyard School," though the imitations were by no means confined to Scotland. In this school the Auld Licht Idyls and A Window in Thrushes remained unsurpassed and unapproached. The Scots village tale was no novelty in literature—witness John Galt, the Chronicles of Cartlodge and George MacDonald. Yet Mr Barrie, in spite of a dialect not easy to the Southron, contrived to touch a more intimate and more responsive chord. With the simplest materials he achieved an almost unendurable pathos, which yet is never forced; and the pathos is salted with humour, while about the moving homeliness of his humanity play the gleams of a whimsical wit. Stevenson, in a letter to Mr Henry James, in December 1892, said justly of Barrie that "there was genius in him, but there was a journalist on his elbow." This genius found its most perfect and characteristic expression in the humanity of "Thrushes" and the bizarre and tender fantasy of Peter Pan.

BARRIE, the capital of Simcoe county, Ontario, Canada, 56 m. N. of Toronto, Lake Simcoe, an important centre on the Grand Trunk railway. It contains several breweries, carriage factories, boat-building and railway shops, and manufactories of woollens, stoves and leather. It is also a summer resort and the starting-point for the numerous Lake Simcoe steamers. Pop. (1901) 9549.

BARRIÈRE, THÉODORE (1823-1877), French dramatist, was born in Paris in 1823. He belonged to a family of map engravers which had long been connected with the war department, and spent nine years in that service himself. The success of a vaudeville he had performed at the Beaumarchais and which was immediately snapped up for the repertory of the Palais Royal, showed him his real vocation. During the next thirty years he signed, alone or in collaboration, over a hundred plays; among the most successful were: La Vie de bohème (1849), adapted from Hugo's novel with the novelist's help; Madame Lescot (1852); Les Filles de marbre (1853); L'Heritage de Monsieur Plumet (1858); Les Fous Bonhommes (1856) with Ernest Capendu; Malheur aux vaissins (1865), which was forbidden by the censor; Le Gascon (1875). Barrière died in Paris on the 16th of October 1877.

See also Revue des deux mondes (March 1859).

BARRIÈRE TREATY, the name given first to the treaty signed on 29th of October 1709 between Great Britain and the states-general of the United Netherlands, by which the latter engaged to guarantee the Protestant succession in England in favour of the house of Hanover; while Great Britain undertook to procure for the Dutch an adequate barrier on the side of the Netherlands, consisting of the towns of Furnes, Nieuport, Ypres, Menin, Lille, Tournai, Condé, Valenciennes, Maubeuge, Charleroi, Namur, Halle, Damme, Dendermond and the citadel of Ghent. The treaty was based on the same principle of securing Holland against French aggression that had inspired that of Ryswick in 1698, by the terms of which the chief frontier fortresses of the Netherlands were to be garrisoned by Dutch troops. A second Barrier Treaty was signed between Great Britain and Holland on 29th of January 1715, by which the strong places designed for the barrier were reduced to Furnes, the fort of Knocke, Ypres, Menin, Tournai, Mons, Charleroi and the citadel of Ghent, and certain fortresses in the neighbourhood of that city and of Bruges; Great Britain undertaking to obtain the right for the Dutch to garrison them from the future sovereign of the Spanish Netherlands. Its terms were included in the treaty of Rastatt, between the emperor and France, signed on the 7th of March 1714. A third Barrier Treaty was signed in November 1715.

BARRILLI, ANTONIO GIULIO (1836- ), Italian novelist, was born at Savona, and was educated for the legal profession, which he abandoned for journalism in Genoa. He was a volunteer in the campaign of 1859 and served with Garibaldi in 1866 and 1867. From 1865 (Capitan Dodero) onwards he published a large number of books of fiction, which had wide popularity, his work being commonly compared with that of Victor Cherbuliez. Some of the best of the later ones are Santa Cecilia (1866), Come un Segno (1875), and L'Olmo e l'Edera (1877). His Raggio di Dio appeared in 1890. Barrilli also wrote two plays and various volumes of criticism, including Il rinnovamento letterario italiano (1890). He was elected to the Italian chamber of deputies in 1876; and in 1886 became professor of Italian literature at Genoa.

BARRING-OUT, a custom, formerly common in English schools, of barring the master out of the school premises. A typical example of this practice was at Bromfield school, Cumberland, where in 1747 the master, William Pemberton, was "it was the custom, time out of mind, for the scholars, at Fasting's Even (the beginning of Lent) to depose and exclude the master from the school for three days." During this period the school doors were barricaded and the boys armed with mock weapons. If the master's attempts to re-enter were successful, extra tasks were inflicted as a penalty, and willingly performed by the boys. On the third day terms of capitulation, usually in Latin verse, were signed, and these always conceded the immediate right to indulge in football and a cockfight. The custom was long retained at Eton and figures in many school stories.

BARRINGTON, DANIELS (1727-1800), English lawyer, antiquary and naturalist, was born in 1727, fourth son of the first Viscount Barrington. He was educated for the profession of the law, and after filling various posts, was appointed a Welsh judge in 1757 and afterwards second justice of Chester. Though an indifferent judge, his Observations on the Statutes, chiefly the more ancient, from Magna Charta to 21st James I., cap. 27, with an appendix, being a proposal for new-modelling the Statutes (1766), had a high reputation among historians and constitutional antiquaries. In 1773 he published an edition of Orosius, with Alfred's Saxon version, and an English translation with original notes. His Tract on the Probability of reaching the North Pole (1773) was written as a consequence of the northern voyage of discovery undertaken by Captain C. J. Phipps, afterwards Lord Mulgrave (1744-1792). Barrington's other writings are chiefly to be found in the publications of the Royal and Antiquarian Societies, of both of which he was long a member, and of the latter vice-president. Many of these were collected by him in a quarto volume entitled Miscellanies on various Subjects (1781). He contributed to the Philosophical Transactions for 1780 an account of Mozart's visit at eight years of age to London. In his Miscellanies on varied subjects he included this with accounts of four other prodigies, namely, Crotch, Charles and Samuel Wesley, and Garrett Wellesley, Lord Mornington. Among the most curious and ingenious of his papers are his Experiments and Observations on the Singing of Birds, and his Essay on the Language of Birds. He died on the 14th of March 1800 and was buried in the Temple church.

BARRINGTON, GEORGE (b. 1755), an Irishman with a curious history, was born at Maynooth on the 14th of May 1755, the son of a working silversmith named Waldron. In 1771 he robbed his schoolmaster at Dublin and ran away from school, becoming a member of a touring theatrical company under the assumed name of Barrington. At Limerick races he joined the manager of the company in pocket-picking. The manager was detected and sentenced to transportation, and Barrington fled to London, where he assumed clerical dress and continued his pocket-picking. At Covent Garden theatre he robbed the Russian prince Orlov of a snuff-box, said to be worth £30,000. He was
detected and arrested, but as Prince Orlov declined to prosecute, was discharged, though subsequently he was sentenced to three years' hard labour for pocket-picking at Drury Lane theatre. On his release he was again caught at his old practices and sentenced to five years' hard labour, but influenced by the condition that he left England, he accordingly went for a short time to Dublin, and then returned to London, where he was once more detected pocket-picking, and, in 1790, sentenced to seven years' transportation. On the voyage out to Botany Bay a conspiracy was hatched by the convicts on board to seize the ship. Barrington disclosed the plot to the captain, and the latter, on reaching New South Wales, reported him favourably to the authorities, with the result that in 1792 Barrington received a warrant of emancipation (the first issued), becoming subsequently superintendent of convicts and later high constable of Paramatta. In 1796 a theatre was opened at Sydney, the principal actors being convicts, and Barrington wrote the prologue to the first production. This prologue has obtained a wide publicity. It begins:

"From distant climes, o'er widespread seas, we come, Though not with much éclat or beat of drum; True patriots we, for, be assured, We left our country for our country's good."

Barrington died at a ripe old age at Paramatta, but the exact date is not on record. He was the author of A Voyage to Botany Bay (London, 1801); The History of New South Wales (London, 1802); The History of New Holland (London, 1808).

BARRINGTON, JOHN SHUTE, 1ST VISCOUNT (1678-1734). English lawyer and theologian, was the son of Benjamin Shute, merchant, and was born at Theobalds, in Hertfordshire, in 1678. He received part of his education at the university of Utrecht, and, after returning to England in 1698, studied law in the Inner Temple. In 1701 he published several pamphlets in favour of the civil rights of Protestant dissenters, to which class he belonged. On the recommendation of Lord Somers he was employed to induce the Presbyterians in Scotland to favour the union of the two kingdoms, and in 1708 he was rewarded for this service by being appointed to the office of commissioner of the customs. From this, however, he was removed on the change of administration in 1711; but his fortune had, in the meantime, been improved by the bequest of two considerable estates,—one of them left him by Francis Barrington of Toffs, whose name he assumed by act of parliament, the other by John Wildman of Becket. Barrington now stood at the head of the dissenters. On the accession of George I. he was returned to parliament for Berwick-upon-Tweed; and in 1720 the king raised him to the Irish peerage, with the title of Viscount Barrington of Ardglass. But having unfortunately engaged in the Harburg lottery, one of the bubble speculations of the time, he was expelled from the House of Commons in 1723,—a punishment which was considered much too severe, and was thought to be personal malice of Walpole. In 1725 he published his principal work, entitled Miscellanea Sacra or A New Method of considering so much of the History of the Apostles as is contained in Scripture, 2 vols. 8vo,—afterwards reprinted with additions and corrections, in 3 vols. 8vo, 1770, by his son Shute. In the same year he published An Essay on the Several Dispensations of God to Mankind. He died on the 14th of December 1734.

BARRINGTON, SAMUEL (1720-1800). British admiral, was the fourth son of the 1st Viscount Barrington. He entered the navy at an early age and in 1747 had worked his way to a post-captaincy. He was in continuous employment during the peace of 1748-1756, and on the outbreak of the Seven Years' War served with Hawke in the Basque roads in command of the "Achilles" (60). In 1759 the "Achilles" captured a powerful French privateer, after two hours' fighting. In the Havre-de-Grace expedition of the same year Barrington's ship carried the flag of Rear-Admiral Rodney, and in 1760 sailed with John Byron to destroy the Louisburg fortifications. At the peace in 1763 Barrington had been almost continuously afloat for twenty-two years. He was next appointed in 1768 to the frigate "Venus" as governor to the duke of Cumberland, who remained with him in all ranks from midshipman to rear-admiral. In 1778 the duke's flag-captain became rear-admiral and went to the West Indies, while in conjunction with the army he took the island of Santa Lucía from the French, and repulsed the attempt of the Comte d'Esnau to retake it. Superseded after a time by Byron, he remained as that officer's second-in-command and was present at Grenada and St. Kitts (6th and 22nd of July 1779). On his return home, he was offered, but refused, the command of the Channel fleet. His last active service was the relief of Gibraltar in October 1782. As admiral he flew his flag for a short time in 1790, but was not employed in the French revolutionary wars. He died in 1800.

See Rafe, Naval Biographies, i. 120; Charmock, Biographia Navalis, vi. 10.

BARRINGTON, SHUTE (1734-1826), youngest son of the 1st Viscount Barrington, was educated at Eton and Oxford, and after holding some minor dignities was made bishop of Llandaff in 1760. In 1762 he was translated to Salisbury and in 1791 to Durham. He was a vigorous Protestant, though willing to grant Roman Catholics "every degree of toleration short of political power and establishment." He published several volumes of sermons and tracts, and wrote the political life of his brother, Viscount Barrington.

BARRINGTON, WILLIAM WILDMAN SHUTE, 2ND VISCOUNT (1717-1792), eldest son of the 1st Viscount Barrington, was born on the 15th of January 1717. Succeeding to the title in 1734, he spent some time in travel, and in March 1740 was returned to parliament as member for Berwick-upon-Tweed. Having taken his seat in the Irish House of Lords in 1745, he was appointed one of the lords commissioners of the admiralty in 1746, and was one of the "managers" of the impeachment of Simon, Lord Lovat. In 1754 he became member of parliament for Plymouth, in 1755 was made a privy councillor and secretary at war, and in 1761 was transferred to the office of chancellor of the exchequer. In 1762 he became treasurer of the navy, and in 1765 returned to his former position of secretary at war. He retained this office until December 1778, and during four months in 1782 was joint postmaster-general. He married in 1740 Mary, daughter of Mr. Henry Lovell, but left no children. He died at Becket on the 1st of February 1793, and was buried in Shrivenham church.

BARRISTER, in England and Ireland the term applied to the highest class of lawyers who have exclusive audience in all the superior courts, the word being derived from the "bar" (q.v.) in the law courts. Every barrister in England must be a member of one of the four ancient societies called Inns of Court, viz. Lincoln's Inn, the Inner and Middle Temples, and Gray's Inn, and in Ireland, of the King's Inns. The existence of the English societies as schools can be traced back to the 13th century, and their rise is attributed to the clause in Magna Carta, by which the Common Pleas were fixed at Westminster instead of following the king's court, and the professors of law were consequently brought together in London. Associations of lawyers acquired houses of their own in which students were educated in the common law, and the degrees of barrister (corresponding to apprentice or bachelor) and sergeant (corresponding to doctor) were conferred. These schools of law are now represented by the Inns of Court (q.v.).

Students are admitted as members of the Inns of Court, on paying certain fees and on passing a general (elementary) examination or (alternatively) producing evidence of having passed a public examination at a university; their subsequent call to the bar depends on their keeping twelve terms (of which there are four in each year), and passing certain further examinations (see ENGLISH LAW ad fin.). A term is "kept" by dining six times (three for a student whose name is on the books of a university) in hall. This is a relic of the older system in which examinations were not included, the only requisite being a certificate from a barrister that the student had read for twelve months in his chambers. Dining in hall then applied a certain social test, which has now become meaningless. The profession of barrister is open to almost every one; but no person connected...
with the law in any inferior capacity or who is a chartered or professional accountant, can enter an Inn of Court as a student until he has entirely and bona fide ceased to act or practise in such capacity. Some of the Inns do so on a licence that their members shall not be engaged in trade. A form of admission has to be filled up, containing a declaration to this effect, and mentioning inter alia the age, nationality, condition in life and occupation of the applicant. Previous to the student’s call this declaration must be repeated, and he must further declare that he is not in holy orders, has not held any clerical preferment and has not performed any clerical functions during the year preceding. Subject to the above, practising solicitors of not less than five years’ standing may be called to the bar without keeping any terms, upon passing the necessary examinations, and, per contra, a barrister of the same standing may, without any period of apprenticeship, become a solicitor upon passing the final examination for solicitors. Irish barristers of three years’ standing may be called to the English bar without passing any examination upon keeping three terms, and so also may barristers of those colonies where the professions of barrister and solicitor are still distinct. No one can become a barrister till he is twenty-one years old.

The benches of the different Inns of Court have the right of rejecting any applicant for membership with or without cause assigned; and for sufficient reasons, subject to an appeal to the common-law judges as visitors of the Inns, they may refuse to call a student to the bar, or may expel from their society or from the profession ("dis-bar" or "dis-bench") even barristers or benchers. The benches appear to take cognizance of any kind of misconduct, whether professional or not, which they deem unworthy of the rank of barrister. The grade of barrister comprehends the attorney-general and solicitor-general (appointed by and holding office solely at the will of the government of the day), who rank as the heads of the profession, the king’s counsel and ordinary practitioners, sometimes technically known as “utter barristers.”

The peculiar business of barristers is the advocacy of causes in open court, but in England a great deal of other business falls into their hands. They are the chief conveyancers, and the pleadings (i.e., the counter statements of parties previous to joining issue) are in all but the smallest cases drafted by them. There was formerly, indeed, a separate class of conveyancers and special pleaders, being persons who kept the necessary number of terms qualifying for a call but who, instead of being called, took out licences, granted for one year only, but renewable, to practise under the bar, but now conveyancing and special pleading form part of the ordinary work of a junior barrister. The higher rank among barristers is that of king’s or queen’s counsel. They lead in court, and give opinions on cases submitted to them, but they do not accept conveyancing or pleading, nor do they admit pupils to their chambers. Precedence among king’s counsel, as well as among outer barristers, is determined by seniority.¹ The old order of serjeants-at-law (q.v.) who ranked after king’s counsel, is now extinct. Although every barrister has a right to practise in any court in England, each special class of business has its own practitioners, so that the bar may almost be said to be divided into several professions. The most marked distinction is that between barristers practising in chancery and barristers practising in the courts of common law.

The fusion of law and equity brought about by the Judicature Acts 1873 and 1875 was expected in course of time to break down this distinction; but to a large extent the separation between these two great branches of the profession remains. There are also subordinate distinctions in each branch. Counsel at common law attach themselves to one or other of the circuits into which England is divided, and may not practise elsewhere unless under special conditions. In chancery the king’s counsel for the most part restricted themselves to one or other of the courts of the chancery division. Business before the court of probate, divorce and admiralty, the privy council and parliamentary committees, exhibits, though in a less degree, the same tendency to specialization. In some of the larger provincial towns there are also local bars of considerable strength. The bar of Ireland exhibits in its general arrangements the same features as the bar of England. For the Scottish bar, see under ADVOCATES, FACULTY OF. There is no connexion whatever between the Scottish and English bars. A distinctive dress is worn by members of the Bench attending the courts, consisting of a stuff gown, exchanged for one of expression “to take silk” when the wearer has attained the rank of king’s counsel, both classes also having wigs dating in pattern and material from the 18th century.

Counsel is not answerable for anything spoken by him relative to the cause in hand and suggested in the client’s instructions, even though it should reflect on the character of another and prove absolutely groundless, but if he mention an untruth of his own invention, or even upon instructions if it be impertinent to the matter in hand, he is then liable to an action from the party injured. Counsel may also be punished by the summary power of the court or judge as for a contempt, and by the bencies of the inn to which he may belong on cause shown.

The rank of barrister is a necessary qualification for nearly all offices of a judicial character, and a very usual qualification for other important appointments. Not only the judgeships in the superior courts of law and equity in England and in her colonies, but nearly all the magistracies of minor rank—recorderships, county court judgeships, &c.—are restricted to the bar. The result is a unique feature in the English system of justice, viz., the perfect harmony of opinion and interest between the bar as a profession and all degrees of the judicial bench. Barristers have the rank of esquires, and are privileged from arrest whilst in attendance on the superior courts and on circuit, and also from serving on juries whilst in active practice.

Revising Barristers are counsel of not less than seven years’ standing appointed to revise the lists of parliamentary voters. Barristers cannot maintain an action for their fees, which are regarded as gratuities, nor can they, by the usage of the profession, undertake a case without the intervention of a solicitor, except in criminal cases, where a barrister may be engaged directly, by having a fee given him in open court, nor is it competent for them to enter into any contract for payment by their clients with respect to litigation.

¹ A king’s counsel is appointed by letters patent to be “one of His Majesty’s counsel learned in the law.” The appointment rests with the lord chancellor, to whom the barrister desiring a silk gown makes application. There is no definite time required to elapse between the appointment for a seat within the bar, and it is generally understood that a barrister must be of at least ten years’ standing before he is appointed a king’s counsel. The first king’s counsel was Sir Francis Bacon, who was appointed by Queen Elizabeth, and in 1625 was admitted by way of “pledge and fee,” of £40 a year, payable half-yearly. Succeeding king’s counsel received a similar payment, until its abolition in 1801. There was not another appointment of a king’s counsel until 1824, when Lord Chichester was so honoured. From 1775 king’s counsel may be said to have become a regular order. Their number was very small so late as the middle of the 19th century (20 in 1799; 30 in 1810; 28 in 1850), but at the beginning of the 20th century there were over 250. A king’s counsel may not, unless by special licence, take a brief against the crown, but such a licence is never refused unless the crown desires his services in the case.
of Lille. In other memoirs, among which may be mentioned those on the Cretaceous rocks of the Ardennes and of the Basin of Oviedo, Spain; on the (Devonian) Calcare d’Erbray; on the Palaeozoic rocks of Brittany and of northern Spain; and on the granitic and metamorphic rocks of Brittany, Dr Barrios has proved himself an accomplished petrologist as well as palaeontologist and field-geologist. In 1881 he was awarded the Bigsby medal, and in 1901 the Wollaston medal by the Geological Society of London. He was chosen member of the Institute (Academy of Sciences) in 1904.

BARROS, JOÃO DE (1496–1570), called the Portuguese Livy, may be said to have been the first great historian of his country. Educated in the palace of King Manoel, he early conceived the idea of writing history, and, to prove his powers, composed, at the age of twenty, a romance of chivalry, the Chronicle of the Emperor Clarimundo, in which he is said to have had the assistance of Prince John, afterwards King John III. The latter, on ascending the throne, gave Barros the captaincy of the fortress of St George of Elmina, whither he proceeded in 1522, and he obtained in 1523 the post of treasurer of the India House, which he held until 1528.

The post of 1530 drove him from Lisbon to his country house near Pomal, and there he finished a moral dialogue, Rhopica Pneuma, which met with the applause of the learned Juan Luis Vives. On his return to Lisbon in 1532 the king appointed Barros factor of the India and Mina House—positions of great responsibility and importance at a time when Lisbon was the European emporium for the trade of the East. Barros proved a good administrator, displaying great industry and a disinterestedness rare in that age, with the result that he made but little money where his predecessors had amassed fortunes. At this time, John III., wishing to attract settlers to Brazil, divided it up into captaincies and gave that of Maranhão to Barros, who, associating two partners in the enterprise with himself, prepared an armada of ten vessels, carrying nine hundred men, which set sail in 1539. Owing to the ignorance of the pilots, the whole fleet suffered shipwreck, which entailed serious financial loss on Barros, yet not content with meeting his own obligations, he paid the debts of those who had perished in the expedition. During all these busy years he had continued his studies in his leisure hours, and shortly after the Brazilian disaster he offered to write a history of the Portuguese in Asia. The king accepted, and in 1541 Barros wrote the book, but, before printing the first part, he again proved his pen by publishing a Portuguese grammar (1540) and some more moral Dialogues. The first of the Decades of his Asia appeared in 1552, and its reception was such that the king straightway charged Barros to write a chronicle of King Manoel. His many occupations, however, prevented him from undertaking this book, which was finally composed by Damião de Goes (q.v.). The Second Decade came out in 1553 and the Third in 1563, but the Fourth and final one was not published until 1615, long after the author’s death.

In January 1568 Barros retired from his remunerative appointment at the India House, receiving the rank of falado together with a pension and other pecuniary emoluments from King Sebastian, and died on the 20th of October 1570. A man of lofty character, he preferred leaving his children an example of good morals and learning to bequeathing them a large pecuniary inheritance, and, though he received many royal benefactions, they were volunteered, never asked for. As a historian and a stylist Barros deserves the high fame he has always enjoyed. His Decades contain the early history of the Portuguese in Asia and reveal careful study of Eastern historians and geographers, as well as of the records of his own country. They are distinguished by clearness of exposition and orderly arrangement. His style has all the simplicity and grandeur of the masters of historical writing, and the purity of his diction is incontestable. Though, on the whole, impartial, Barros is the narrator and apostle of the great deeds of his countrymen, and lacks the critical spirit and intellectual acumen of Damião de Goes. Diogo do Couto continued the Decades, adding nine more, and a modern edition of the whole appeared in Lisbon in 14 vol. in 1778–1788. The title of Barro’s work is Da Asia de João de Barros, dos feitos que os Portuguezes fizeram no descubrimento e conquista dos mares e terras do Oriente, and the edition is accompanied by a volume containing a life of Barros by the historian Manoel Severim de Faria and a copious index of all the Decades. An Italian version in 2 vols. appeared in Venice in 1561–1562 and a German in 5 vols. in 1821. Clarimundo has gone through the following editions: 1522, 1555, 1601, 1749, 1872 and 1843, all published in Lisbon. It influenced Francisco de Morais (q.v.), cf. Purser, Palmerin of England, Dublin, 1904, pp. 440 et seq.

The minor works of Barros are described by Innocenço da Silva: Dicionario Bibliographico Portuguez, vol. iii. pp. 320–323 and vol. x. pp. 187–189, and in Severim de Faria’s Life, cited above. A compilation of Barro’s Varia was published by the visconde de Azevedo (Porta, 1869).

BARROS, CAMILLE HYACINTHE ODILON (1701–1873), French politician, was born at Villefort (Lozère) on the 10th of September 1701. He belonged to a legal family, his father, an advocate of Toulouse, having been a member of the Convention who had voted against the death of Louis XVI. Odilon Barrot’s earliest recollections were of the October insurrection of 1795. He was sent to the military school of Saint-Cyr, but presently removed to the Lycée Napoleon to study law and was called to the Parian bar in 1811. He was placed in the office of the attorney general Jean Malhe, who was advocate before the council of state and the council of revision and was soon to get the second restoration. Barrot eventually succeeded him in both positions. His dissatisfaction with the government of the restoration was shown in his conduct of some political trials. For his opposition in 1820 to a law by which any person might be arrested and detained on a warrant signed by three ministers, he was summoned before a court of assize, but acquitted. Although intimate with Lafayette and others, he took no actual share in their schemes for the overthrow of the government, but in 1827 he joined the association known as Aide-toi, le ciel t’aidera. He presided over the banquet given by the society to the 221 deputies who had signed the address of March 1830 to Charles X., and threatened to reply to force by force. After the ordinances of the 26th of July 1830, he joined the National Guard and took an active part in the revolution. As secretary of the municipal commission, which sat at the hôtel-de-ville and formed itself into a provisional government, he was charged to convey to the deputies a protest embodying the terms which the advanced Liberals wished to impose on the king in 1830. He supported the idea of a constitutional monarchy and the extreme Republicans, and he was appointed one of the three commissioners chosen to escort Charles X. out of France. On his return he was nominated prefect of the department of the Seine. His concessions to the Parisian mob and his extreme gentleness towards those who demanded the prosecution of the ministers of Charles X. led to an unflattering comparison with Jérôme Pétion under similar circumstances. Louis Philippe’s government was far from satisfying his desires for reform, and he persistently urged the “broadening of the bases of the monarchy,” while he protested his loyalty to the dynasty. He was returned to the chamber of deputies for the department of Eure in 1831. The day after the demonstration of June 1832 on the occasion of the funeral of General Lamarque, he made himself indirectly the mouthpiece of the Democrats in an interview with Louis Philippe, which is given at length in his Mémoires. Subsequently, in pleading before the court of cassation on behalf of one of the rioters, he secured the annulment of the judgments given by the council of war. The death of the duke of Nemours in 1841 was a blow to Barrot’s party, which sought to substitute the regency of the duchess of Orleans for that of the duke of Nemours in the event of the succession of the court of Paris. In 1846 Barrot made a tour in the Near East, returning in time to take part a second time in the preliminaries of revolution. He organized banquet of the disaffected in the various cities of France, and demanded electoral reform to avoid revolution. He did not foresee the strength of the outbreak for which his eloquence had prepared the way, and clung to the programme of 1830. He tried to support the regency of the duchess in the chamber on the 24th of February, only to find that the time was past for
BARROW, ISAAC (1630-1677), English mathematician and divine, was the son of Thomas Barrow, a linen-draper in London, belonging to an old Suffolk and Cambridgeshire family. His uncle was Bishop Isaac Barrow of St Asaph (1614-1668). He was at first placed for two or three years at the Charterhouse school. There, however, his conduct gave but little hope of his ever succeeding as a scholar. But after his removal from this establishment to Felsted school in Essex, where Martin Holbech was master, his disposition took a happier turn; and having soon made considerable progress in learning, he was in 1643 entered at St. Peter's College, and afterwards at Trinity College, Cambridge, where he applied himself to the study of literature and science, especially of natural philosophy. He at first intended to adopt the medical profession, and made some progress in anatomy, botany and chemistry, after which he studied chemistry, geometry and astronomy. He then travelled in France and Italy, and in a voyage from Leithorn to Smyrna gave proofs of great personal bravery during an attack made by an Algerine pirate. At Smyrna he met with a kind reception from the English consul, Mr Breton, upon whose death he afterwards wrote a Latin elegy. From this place he proceeded to Constantinople, where he received similar civilities from Sir Thomas Bendish, the English ambassador, and Sir Jonathan Dawes, with whom he afterwards contracted an intimate friendship. While at Constantinople he read and studied the works of St Chrysostom, who was afterwards called the saint of the Turks. He resided in Turkey somewhat more than a year, after which he proceeded to Venice, and thence returned home through Germany and Holland in 1659.

Immediately on reaching England he received ordination from Bishop Brownrig, and in 1660 he was appointed to the Greek professorship at Cambridge. When he entered upon this office he intended to have preceded upon the tragedies of Sophocles; but he altered his intention and made choice of Aristotle's rhetoric. His lectures on this subject, having been lent to a friend who never returned them, are irrecoverably lost. In July 1662 he was elected professor of geometry in Gresham College, on the recommendation of Dr John Wilkins, master of Trinity College and afterwards bishop of Chester; and in May 1663 he was chosen a fellow of the Royal Society, at the first election made by the council after obtaining their charter. The same year the executors of Henry Lucas, who, according to the terms of his will, had founded a mathematical chair at Cambridge, fixed upon Barrow as the first professor; and although his two shipwrecks were not inconsistent with each other, he chose to resign that of Gresham College, which he did on the 20th of May 1664. In 1669 he resigned his mathematical chair to his pupil, Isaac Newton, having now determined to renounce the study of mathematics for that of divinity. Upon quitting his professorship Barrow was only a fellow of Trinity College; but his uncle gave him a small sinecure in Wales, and Dr Seth Ward, bishop of Salisbury, conferred upon him a prebend in that church. In the year 1670 he created doctor in divinity by mandate; and, upon the promotion of Dr Pearson to the see of Chester, he was appointed to succeed him as master of Trinity College by the king's patent, bearing the date of the 13th of February 1672. In 1675 Dr Barrow was chosen vice-chancellor of the university. He died on the 4th of May 1677, and was interred in Westminster Abbey, where a monument, surmounted by his bust, was soon after erected by the contributions of his friends. By his English contemporaries Barrow was considered a mathematician second only to Newton. Continental writers do not place him so high, and their judgment is probably the more correct one. He was undoubtedly a clear-sighted and able mathematician, but failed to develop the severe geometrical method, and who in his Method of Tangents was succeeded to the course of reasoning by which Newton was afterwards led to the doctrine of ultimate ratios; but his substantial contributions to the science are of no great importance, and his lectures upon elementary principles do not throw much light on the difficulties surrounding the border-land between mathematics and philosophy. (See Infinitesimal Calculus.) His Sermons have long enjoyed a high reputation; they are weighty pieces of reasoning, elaborate in construction and ponderous in style.

His scientific works are very numerous. The most important are:
- Euclid's Elements; Euclid's Data; Optical Lectures, read in the public school at Cambridge; Thirteen Geometrical Lectures; The Works of Archimedes, the Four Books of Apollonius's Conic Sections, and Theodorus's Spheres, explained in a New Method; A Lecture, in which Archimedes' Theorems of the Sphere and Cylinder are investigated and briefly demonstrated; Mathematical Lectures, read in the public schools of the university of Cambridge. The above were all written in Latin. His English works have been collected and published in four volumes folio.

See Ward, Lives of the Gresham Professors, and Whewell's biography prefixed to the 9th volume of Napier's edition of Barrow's Sermons.

BARROW, SIR JOHN (1674-1848), English statesman, was born in the village of Drageley Beck in the parish of Ulverston in Lancashire, on the 10th of June 1764. He started in life as a superintending clerk of an iron foundry at Liverpool and afterwards taught mathematics at a school in Greenwich. Through the interest of Sir George Staunton, to whose son he taught mathematics, he was attached on the first British embassy to China as comptroller of the household to Lord Macartney. He soon acquired a good knowledge of the Chinese language, on which he subsequently contributed interesting articles to the Quarterly Review; and the account of the embassy published by Sir George Staunton records many of Barrow's valuable contributions to literature and science connected with China. Barrow was appointed successor of his father-in-law connected with Chinese affairs after the return of the embassy, in which his father took much interest in them, and on critical occasions was frequently consulted by the British government. In 1797 he accompanied Lord Macartney, as private secretary, in his important and delicate mission to settle the government of the newly acquired colony of the Cape of Good Hope. Barrow was entrusted with the task of reconciling the Boers and Kaffirs and of reporting on the country in the interior. On his return from his journey, in the course of which he visited all parts of the colony, he was appointed auditor-general of public accounts. He now decided to settle in South Africa, married Anne Maria Trüter, and in 1800 bought a house in Cape Town. But the surrender of the colony at the peace of Amiens (1802) upset this plan. He returned to England in 1804, was appointed by Lord Melville second secretary to the admiralty, a post which he held for...
forty years. He enjoyed the esteem and confidence of all the eleven chief lords who successively presided at the admiralty board during that period, and more especially of King William IV. while lord high admiral, who honoured him with tokens of his personal regard. Barrow was a fellow of the Royal Society, and in 1821 received the degree of L.L.D. from Edinburgh University. A baronetcy was conferred on him by Sir Robert Peel in 1835. He retired from public life in 1845 and devoted himself to writing a history of the modern Arctic voyages of discovery (1846), of which he was a great promoter, as well as his autobiography, published in 1847. He died suddenly on the 23rd of November 1848.

Besides the numerous articles in the Quarterly Review already mentioned, Barrow published among other works, Travels in China (1804); Travels into the Interior of South Africa (1806); and lives of Lord Macartney (1807), Lord Anson (1839), Lord Howe (1838). He was also the author of several valuable contributions to the seventh edition of the Encyclopaedia Britannica. See Memoir of John Barlow, by G. F. Staunton (1852).

BARROW, a river of south-eastern Ireland. It rises in the Slieve Bloom mountains, and flows at first easterly and then almost due south, until, on joining the Suir, it forms the estuary of the south-east known as Waterford Harbour. Including the 12 m. of the estuary, the length of its valley is rather more than 100 m., without counting the lesser windings of the river. The total area of drainage to Waterford Harbour (including the basin of the Suir) is 3300 sq. m., and covers the whole of the county Kilkenny, with parts of Waterford, Cork and Limerick, Tipperary, Carlow, King's and Queen's counties. The chief towns on the banks of the Barrow are Athy (where it becomes navigable and has a junction with the Grand Canal), Carlow, Bagenalstown and New Ross. The chief affluent is the Nore, which it receives from the north-west a little above New Ross. The scenery on its banks is in parts very beautiful.

BARROW (from A.S. beorh, a mount or hillock), a word found occasionally among place-names in England applied to natural eminences, but generally restricted in its modern application to denote an ancient grave-mound. The custom of constructing barrows or mounds of stone or earth over the remains of the dead was a characteristic feature of the sepulchral systems of primitive times. Originating in the common sentiment of humanity, which desires by some visible memorial to honour and perpetuate the memory of the dead, it was practised alike by peoples of high and of low development, and continued through all the stages of culture that preceded the introduction of Christianity. The primary idea of sepulture appears to have been the provision of a habitation for the dead; and thus, in its perfect form, the barrow included a chamber or chambers where the tenant was surrounded with the prized possessions of his previous life. A common feature of the earlier barrows is the enclosing fence, which marked off the site from the surrounding ground. When the barrow was of earth, this was effected by an encircling trench or a low sodum. When the barrow was a stone structure, the enclosing was usually a circle of standing stones. Sometimes, instead of a chamber formed above ground, the barrow covered a pit excavated for the interment under the original surface. In later times the mound itself was frequently dispensed with, and the interments made within the enclosure of a trench, a sodum or a circle of standing stones. Usually the great barrows occupy conspicuous sites; but in general the external form is no index to the internal construction and gives no definite indication of the nature of the sepulchral usages. Thus, while the long barrow is characteristic of the Stone Age, it is impossible to tell without direct examination whether it may be chambered or unchambered, or whether the burials within it may be those of burnt or of unburnt bodies.

In England the long barrow usually contains a single chamber, entering by a passage underneath the higher and wider end of the mound. In Denmark the chambers are at irregular intervals along the body of the mound, and have no passages leading into them. The long barrows of Great Britain are often from 200 to 400 ft. in length by 60 to 80 ft. wide. Their chambers are rude but strongly built, with dome-shaped roofs, formed by overlapping the successive courses of the upper part of the side walls. In Scandinavia, on the other hand, such dome-roofed chambers are unknown, and the construction of the chambers as a rule is megalithic, five or six monoliths supporting one or more capstones of enormous size. Such chambers, denuded of the covering mound, or over which no covering mound has been raised, are popularly known in England as "cromlechs" and in France as "dolmens" (see STONE MONUMENTS). The prevailing mode of sepulture in all the different varieties of these structures is by the deposit of the body in a contracted position, accompanied by weapons and implements of stone, occasionally by ornaments of gold, jet or amber. Vessels of clay, more or less ornate in character, which occur with these early interments of unburnt bodies, have been regarded as food-vessels and drinking-cups, differing in character and purpose from the cinerary urns of larger size in which the ashes of the dead were deposited after cremation.

The custom of burning the body commenced in the Stone Age, before the long barrow or the dolmen had passed out of use. While cremation is rare in the long barrows of the south of England, it is the rule in those of Yorkshire and the north of Scotland. In Ireland, where the long barrow form is all but unknown, the round barrow or chambered cairn prevailed from the earliest Pagan period till the introduction of Christianity. The Irish barrows occur in groups in certain localities, some of which seem to have been the royal cemeteries of the tribal confederacies, whereas eight are enumerated in an ancient Irish manuscript, the Leabhar na h-Uídhir, compiled c. a.d. 1100. The best-known of these is situated on the banks of the Boyne above Drogheda, and consists of a group of the largest cairns in Ireland. One, at New Grange, is a huge mound of stones and earth, over 300 ft. in diameter and 70 ft. in height. Around its base are the remains of a circle of large standing stones. The chamber, which is 20 ft. high in the centre, is reached by a passage about 70 ft. in length. In the Loughcrew Hills, Co. Meath, there is a group of about thirty stone barrows or cairns, mostly chambered, their bases measuring from 5 to 6 yds. in diameter. They are unusually interesting from the fact that many of the exposed slabs in the walls of the chambers are ornamented with spirals and other devices, rudely incised. As in the case of the long barrows, the traditional form of the circular, chambered barrow was retained through various changes in the sepulchral customs of the people. It was the natural result of the practice of cremation, however, that it should induce a modification of the barrow structure. The chamber, no longer regarded as a habitation to be tenanted by the deceased, became simply a cist for the reception of the urn which held his ashes. The degradation of the chamber naturally produced a corresponding degradation of the mound which covered it, and the barrows of the Bronze Age, in which cremation was common, are smaller and less imposing than those of the Stone Age, but often surprisingly rich in the relics of the life and of the art workmanship of the time. In addition to the varied and beautiful forms of implements and weapons—frequently ornamented with a high degree of artistic taste—armlets and other personal ornaments in gold, amber, jet and bronze are not uncommon. The barrows of the bronze period, like some of those of the Stone Age, appear to have been used as tribal or family cemeteries. In Denmark as many as seventy deposits of burnt interments have been observed in a single mound, indicating its use as a burying-place throughout a long succession of years.

In the Iron Age there was less uniformity in the burial customs. In some of the barrows in central France, and in the wolds of Yorkshire, the interments include the arms and accoutrements of a charioteer, with his chariot, harness and horses. In Scandinavia a custom, alluded to in the sagas, of burying the viking in his ship, drawn up on land, and raising a barrow over it, is exemplified by the ship-burials discovered in Norway. The ship found in the Gokstad mound was 78 ft. long, and had a mast and sixteen pairs of oars. In a chamber abaft the mast the viking had been laid, with his weapons, and together with him were
buried twelve horses, six dogs and a peacock. An interesting
example of the great timber-chambered barrow is that at
Jelling in Jutland, known as the barrow of Thyre Danebod,
queen of King Gorm the Old, who died about the middle of the
10th century. It is a mound about 200 ft. in diameter, and over
50 ft. in height, containing a chamber 23 ft. long, 8 ft. wide
and 5 ft. high, formed of massive slabs of oak. Though it had
been entered and plundered in the middle ages, a few relics were found
when it was reopened, among which were a silver cup, ornamented
with the interlacing work characteristic of the time and some
personal ornaments. It is highly illustrative of the tenacity with
which the ancient sepulchral usages were retained even after the
introduction of Christianity that King Harold, son and successor of
Gorm the Old, who is said to have christianized all Denmark
and Norway, followed the pagan custom of erecting a chambered
tumulus over the remains of his father, on the summit of which
was placed a rude pillar-stone, bearing on one side the memorial
inscription in runes, and on the other a representation of the
Saviour of mankind distinguished by the crossed nimbus surround-
ning the head. The so-called Kings' Hows at Uppsal in
Sweden rival those of Jelling in size and height. In the chamber
of one, opened in 1839, there was found an urn full of calcined
bones; and along with it were ornaments of gold showing the
characteristic workmanship of the 5th and 6th centuries of the
century. Along with the calcined human bones were bones of
animals, among which those of the horse and the dog were
distinguished.

Comparing the results of the researches in European barrows
with such notices of barrow-burial as may be gleaned from early
writings, we find them mutually illustrative.

The Homeric account of the building of the barrow of Hector
(II. xiv.) brings vividly before us the scene so often suggested by
the examination of the tumuli of prehistoric times. During
nine days wood was collected and brought, in carts drawn by oxen,
to the site of the funeral pyre. Then the pyre was built and the
body laid upon it. After burning for twenty-four hours the
smouldering embers were extinguished with libations of wine.
The white and calcined bones were then picked out of the ashes
by the friends and placed in a metallic urn, which was deposited
in a hollow grave or cist and covered over with large well-fitting
stones. Finally, a barrow of great magnitude was heaped over
the remains and the funeral feast was celebrated. The obsequies
of Achilles, as described in the Odyssey, were also celebrated with
details which are strikingly similar to those observed in tumuli
both of the Early and the Bronze Age. The body was brought to the
pile in an embroidered robe and jars of unguents and honey were
placed beside it. Sheep and oxen were slaughtered at the pile.
The cinerated bones were collected from the ashes and placed
in a golden urn along with those of Patroclus, Achilles' dearest
friend. Over the remains a great and shapely mound was raised
on the high headland, so that it might be seen afar by future
generations of men.

Herodotus, describing the funeral customs of the Scythians,
states that, on the death of a chief, the body was placed upon
a couch in a chamber sunk in the earth and covered with timber,
in which were deposited all things needful for the comfort of the
deceased in the other world. One of his wives was strangled
and laid beside him, his cup-bearer and other attendants, his char-
teer and his horses were killed and placed in the tomb, which
was then filled up with earth and an enormous mound raised high
over all. The barrows which cover the plains of ancient Scythia attest
the truth of this description. A Siberian barrow, described by
Demidow, contained three contiguous chambers of unhewn stone.
Under the central chamber lay the skeleton of the ancient chief, on
his sword, his spear, his bow and a quiver full of arrows. The
skeloton reclined upon a sheet of pure gold, extending the whole
length of the body, which had been wrapped in a mantle brodered
with gold and studded with precious stones. Over it was extended
another sheet of pure gold. In a smaller chamber at the chief's
head lay the skeleton of a female, richly attired, extended upon
a sheet of pure gold and similarly covered with a sheet of the same
metal. A golden chain adorned her neck and her arms were
encircled with bracelets of pure gold. In a third chamber, at the
chief's feet, lay the skeleton of his favourite horse with saddle,
bridle and stirrups.

So curiously alike in their general features were the sepulchral
usages connected with barrow-burial over the whole of Europe,
that we find the Anglo-Saxon Saga of Beowulf describing the
chambered tumulus with its gigantic masonry "held fast on props,
with vaults of stone," and the passage under the mound haunted
by a dragon, the guardian of the treasures of heathen gold which
it contained. Beowulf's own burial is minutely described in terms
which have a strong resemblance to the parallel passages in the
IIiad and Odyssey. There is first the preparation of the pile,
which is hung round with helmets, shields and coats of mail.
Then the corpse is brought and laid in the midst; the pile is
kindled and the roaring flame rises, mingled with weeping, till
all is consumed. Then, for ten long days, the warriors labour at
the rearing of his mighty mound on the headland, high and broad,
to be seen afar by the passers-by on land and sea.

The pyramids of Egypt, the mausoleums of the Lydian kings,
the circular, chambered sepulchres of Mycenae, and the Etruscan
tombs at Caere and Volci, are lineally descended from the
chambered barrows of prehistoric times, modified in construction
according to the advancement of architectural art at the period of
their erection. There is no country in Europe desitute of more
or less well-preserved vestiges of the barrow-burial in early times. It can also be traced on both sides
of the basin of the Mediterranean, and from Asia Minor across
the continent to India, China and Japan.

In the new world as well as in the old, similar customs pre-
valing from a very remote period. In the great plains of North
America the dead were buried in barrows of enormous magnitude,
which occasionally present a remarkable similarity to the barrows
of Great Britain. In these mounds cremation appears more
frequently than inhumation; and both are accompanied by
implements, weapons and ornaments of stone and bone. The
pottery accompanying the remains is often elaborately orna-
ted, and the mound builders were evidently possessed of a
higher development of taste and skill than is evinced by any of
the modern aboriginal races, by whom the mounds and their
contents are regarded as utterly mysterious.

It is not to be wondered at that customs so widely spread
and so deeply rooted as those connected with barrow-burial should
have been difficult to eradicate. In fact, compliance with the
Christian practice of inhumation in the cemeteries sanctified by
the Early Christians was only enforced in Europe by capitularies denounced
by burning the dead after the pagan fashion or in the pagan mounds.
Yet even in the middle ages kings of Christian countries were buried
with their swords and spears, and queens with their spindles and
ornaments; the bishop was laid in his grave with his crozier and
comb; the priest with his chalice and vestments; and clay
vessels filled with charcoal (answering to the urns of heathen
times) are found in the churches of France and Denmark.

BARROWE, HENRY (1550—1593). English Puritan and Sepa-
ratist, was born about 1550, at Shipdham, Norfolk, of a
family related by marriage to the lord keeper Bacon, and
BARROW-IN-FURNESS—BARRY, SIR C. 443

probably to Aylmer, bishop of London. He matriculated at Clare Hall, Cambridge, in November 1566, and graduated B.A. in 1569-1570. Afterwards he "followed the court" for some time, leading a frivolous if not licentious life. He was a member of Gray's Inn for a few years from 1576, but was never called to the bar. About 1586 or 1587 he was deeply impressed by a sermon, whereupon he retired to the country, and was led by study and meditation to the strictest form of Puritanism. Subsequently, in what manner is not known, he came into intimate relations with John Greenwood, the Separatist leader, whose views (probably due, in part at least, to Browne's influence) he adopted without reserve. Though not strictly resident in London at this time, he was associated with "the brethren of the Separation" there, in whose secret meetings his natural earnestness and eloquence made him conspicuous. Greenwood having been imprisoned in the Clink, Barrow went to the country to visit him, and on the 19th of November 1586 was detained by the gaoler and brought before Archbishop Whitgift. He insisted on the illegality of this arrest, refused either to take the ex officio oath or to give bail for future appearance, and was committed to the Gatehouse. After nearly six months' detention and several formal examinations before the high commissioners, he and Greenwood were formally indicted (May 1587) for recusancy under an act originally directed against Papists. They were ordered to find heavy bail for conformation, and to remain in the Fleet Prison until it was forthcoming. Barrow continued a prisoner for the remainder of his life, nearly six years, sometimes in close confinement, sometimes having "the liberty of the prison." He was subjected to several more examinations, once before the privy council at Whitehall on the 16th of March 1588, as a result of petition to the queen. On these occasions he vigorously maintained the principle of separatism, denouncing the prescribed ritual of the Church as "a false worship," and the bishops as oppressors and persecutors. During his imprisonments he was engaged in written controversy with Robert Browne (down to 1588), who had yielded a partial submission to the established order, and whom he therefore accounted a renegade. He also wrote several vigorous treatises in defence of separatist and congregational independence, the most important being:—

A True Description of the Visible Clergy of the Saints, &c. (1589); A Plain Refutation of Mr Gifford's Book, intituled A Short Treatise Gainst the Denominations of England (1590-1591), and A Brief Discovery of the False Church (1591). Others were written in conjunction with his fellow-prisoner, Greenwood. These writings were taken charge of by friends and mostly printed in Holland. By 1590 the bishops thought it advisable to try other means of convincing or silencing these inadmissible controversialists, and sent several conforming Puritan ministers to confer with them, but without effect. At length it was resolved to proceed on a capital charge of "devising and circulating seditious books," for which, as the law then stood, it was easy to secure a conviction. They were tried and sentenced to death on the 23rd of March 1593. What followed is, happily, unique in the history of English misrule. The day after sentence they were brought out as if for execution and reprieved. On the 31st of March they were taken to the gallows, and after the ropes had been placed about their necks were again reprieved. Finally they were hanged early on the morning of the 6th of April. The motive of all this is obscure, but there is some evidence that the lord treasurer Burghley endeavoured to save their lives, and was frustrated by Whitgift and other bishops.

The opinions of Browne and Barrow had much in common, but were not identical. Both maintained the right and duty of the Church to carry out necessary reforms without awaiting the permission of the civil power; and both advocated congregational independence. But the ideal of Browne was a spiritual democracy, towards which separation was only a means. Barrow, on the other hand, regarded the whole established church order as polluted by the relics of Roman Catholicism, and insisted on separation as essential to pure worship and discipline (see further CONGREGATIONALISM). Barrow has been credited by H. M. Dexter and others with being the author of the "Marpurate Tracts" but this is improbable.

BARROW-IN-FURNESS, a seaport and municipal, county and parliamentary borough of Lancashire, England, 264½ m. N.W. by N. from London, on the Furness railway. Pop. (1891) 51,712; (1901) 57,586. It lies on the seaward side of the hammer-shaped peninsula forming part of the district of Furness, between the estuary of the Duddon and Morecambe Bay, where a narrow channel intervenes between the mainland and the long low island of Walney, on which the erection of a strong fort was undertaken by the War Office in 1904. In 1905 the connexion of Walney with the mainland by a bridge was undertaken. In the channel is Barrow Island (among others) which is connected with the mainland, reclamation having been carried on until only a narrow channel was left, which was utilized as docks. Barrow is of modern and remarkably rapid growth. Its rise was dependent primarily on the existence and working of the veins of pure haematite iron ore in the district of Furness (q.v.). At the outset Barrow merely exported the ore to the furnaces of South Wales and the Midlands. At the beginning of the 19th century this export amounted at most to a few thousand tons, and though by the middle of the century it had reached some 50,000 in 1847 the population of Barrow was only 325. In 1846 the first section of the Furness railway was opened, connecting Barrow with the mines near Dalton; in the ensuing years a great increase in trade justified the opening of further communications, and in 1859 the iron works of Messrs Schneider & Hannay were instituted. The Barrow Haematite Steel Company (1866) absorbed this company, and a great output of steel produced by the Bessemer process was begun. Other industries followed. Of these the shipbuilding works have surpassed the steel works in importance, the celebrated firm of Vickers, Sons & Maxim having a yard where they construct numerous vessels of war as well as others. There are also a petroleum storage establishment, a paper-pulp factory, jute works, and engineering and wagon works.

The docks in the strait between Barrow Island and the mainland were constructed in 1867, and named the Devonshire and Buccleuch docks. The Ramsden docks are a subsequent extension. These are 24 ft. in depth. There are also a graving dock 300 ft. long, a depositing dock accommodating vessels of 16 ft. draught, and two electric cranes each able to lift 150 tons. The Furness railway company is the dock authority. Passenger steamers run on weekdays to Belfast.

The town is laid out in rectangular form, and contains several handsome churches, municipal buildings, exchange and other public buildings. An electric tramway service connects the outskirts and the centre. There are stations of Lord Frederick Cavendish (assassinated at Dublin, 1882), in front of the town-hall, and of Sir James Ramsden (d. 1896), managing director of the Furness railway and first mayor of Barrow, to whom, together with the dukes of Devonshire and Buccleuch, the town owed much of its rise in the middle of the 19th century. The cottage inhabited by George Romney the painter from 1742 to 1755 has been preserved from demolition and retained as a memorial. Educational institutions include a school of science and art, a girls' high school and a technical school. Barrow is a suffragan bishopric in the diocese of Carlisle. The parliamentary borough (1885), falling within the North Lonsdale division of the county, returns one member. The town was incorporated in 1867, and became a county borough in 1888. The corporation consists of a mayor, 8 aldermen and 24 councillors. Area, 11,023 acres.

BARRY, SIR CHARLES (1765-1860), English architect, was born in London on the 23rd of May 1765, the son of a stationer. He was articled to a firm of architects, with whom he remained till 1817, when he set out on a three years' tour in Greece and Italy, Egypt and Palestine for the purpose of studying
architecture.

His return to England in 1820 and settled in London. One of the first works by which his abilities as an architect became generally known was the church of St Peter at Brighten, completed in 1826. He also designed many other churches; but the marked preference to Italian architecture, which he acquired during his travels, showed itself in various important undertakings of his earlier years. In 1831 he completed the Travellers' Club in Pall Mall, a splendid work in the Italian style and the first of its kind built in London. In the same style and on a grander scale he built in 1837 the Reform Club. He was also engaged on numerous private mansions in London, the finest being Bridgewater House (1847). Birmingham possesses one of his best works in King Edward's grammar school, built in the Tudor style between 1833 and 1836. For Manchester he designed the Royal Institution of Fine Arts (1824) and the Athenaeum (1830); and for Halifax the town-hall. He was engaged for some years in reconstructing the Treasury buildings, Whitehall. But his masterpiece, notwithstanding all unfavourable criticism, is the Houses of Parliament at Westminster (1840-1860). Barry was elected A.R.A. in 1840 and R.A. in the following year. His genius and achievements were recognized by the representative artistic bodies of the principal European nations; and his name was introduced as a member of the academies of art at Rome, Berlin, St Petersburg, Brussels and Stockholm. He was chosen F.R.S. in 1849 and was knighted by Queen Victoria in 1852. He died suddenly at Clapham near London on the 12th of May 1860, and his remains were interred in Westminster Abbey. As a landscape gardener he was no less brilliant than as an architect, and in connexion with the building of the Houses of Parliament he formed schools of modelling, stone and wood carving, cabinet-making, metal-working, glass and decorative painting, and of encaustic tile-making. In 1867 appeared a life of him by his son Bishop Alfred Barry. A claim was thereupon set up on behalf of Pugin, the famous architect, who was dead and who had been Barry's assistant, to a much larger share in the work of designing the Houses of Parliament than was admitted in Dr Barry's narrative. The controversy raged for a time, but without substantiating Pugin's claim.

His second son, Alfred Barry (1826- ), was educated at King's College, London, and Trinity College, Cambridge, where he was 4th wrangler and gained a first-class in the classical tripos in 1848. He was successively sub-warden of Trinity College, Glenalmond (1848-1854), head-master of Leeds grammar school (1854-1862), principal of Cheltenham College (1862-1868), and principal of King's College, London (1868-1883). He was canon of Worcester from 1871 to 1881, and of Westminster from 1881 to 1884. From 1884 to 1886 he served as bishop of Sydney and primate of Australia, and on his return to England he was assistant bishop in the diocese of Rochester from 1889 to 1891, and rector of St James's, Piccadilly, from 1895 to 1900. He was appointed canon of Windsor in 1891 and assistant bishop in West London in 1897. Besides the life of his father mentioned above, he published numerous theological works.

Another son, Edward Malecot Barry (1830-1880), was also an architect. He acted as assistant to his father during the latter years of Sir Charles's life. On the death of his father, the duty of completing the latter's unfinished work devolved upon him. Amongst other buildings thus completed were the Houses of Parliament at Westminster (see Architecture, fig. 91, and Plate X, fig. 118), and Halifax town-hall (ld. fig. 90). In 1864 he was elected an associate of the Royal Academy; and in 1869 a full academian. From 1873 till his death he held the Academy's professorship of architecture. Amongst other buildings designed by him were Covent Garden theatre, Charing Cross and Cannon Street hotels, the Birmingham and Midland Institute, new galleries for the National Gallery and new chambers for the Inner Temple. He died on the 27th of January, 1886.

The youngest son, Sir John Wolfe-Burke (1836- ), the eminent engineer, who assumed the additional name of Wolfe in 1858, was educated at Glenalmond, and was articled as engineering pupil to Sir John Hawkshaw, with whom he was associated in the building of the railway bridges across the Thames at Charing Cross and Cannon Street. In 1867 he began to practise on his own account, and soon gained an extensive connexion with railway companies, both in Great Britain and in other countries. Among the works on which he was engaged were extensions of the Metropolitan District railway, the St Paul's station and bridge of the London, Chatham & Dover railway, the Barry Docks of the Barry railway company near Cardiff, and the Tower and new Kew bridges over the Thames. On the completion of the Tower Bridge in 1894, he was made a C.B., becoming K.C.B. three years later. He served on several royal commissions, including those on Irish Public Works (1868-1890), Highlands and Islands of Scotland (1888-1890), Accidents to Railway Servants (1899-1900), Port of London (1900-1902), and London Traffic (1903-1905). He was elected president of the Institution of Civil Engineers in 1896, and published books on Railway Appliances (1874), and, with Sir F. J. Bramwell, on Railways and Locomotives (1882).

BARRY, Elizabeth (1595-1713), English actress, of whose early life the details are meagre. At first she was so unsuccessful on the stage as to be more than once dismissed; but she was coached by her lover the earl of Rochester, who had laid a wager that in a short time he would make a first-rate actress of her, and the results confirmed his judgment. Mrs Barry's performance as Isabella, queen of Hungary, in the earl of Orrery's Mustapha, was said to have caused Charles II. and the duke and duchess of York so much delight that the duchess took lessons in English from her, and when she became queen she gave Mrs Barry her coronation robes in which to appear as Elizabeth in Banks's Earl of Essex. Mrs Barry is said to have created over 100 parts, and she was particularly successful in the plays of Thomas Otway. Betterton says that her acting gave "success to plays that would disgust the most patient reader." Dryden pronounced her "always excellent." Cibber is authority for the statement that it was on her behalf that criticisms were aimed at the time were fixed for the first production of James II. Mrs Barry had a child by Lord Rochester and a second by Sir George Etheredge, both of whom were provided for by their fathers. In 1709 she retired from the stage and died on the 7th of November 1713.

BARRY, James (1741-1806), English painter, was born at Cork on the 11th of October 1741. His father had been a builder, and, at one time of his life, a coasting trader between the two countries of England and Ireland. To this business of trader James was destined, and he actually made when a boy several voyages; but he manifested such an aversion to the life and habits of a sailor as to induce his father to suffer him to pursue his own inclinations, which led strongly towards drawing and study. At the schools in Cork to which he was sent he was regarded as a prodigy. About the age of seventeen he first attempted oil-painting, and between that and the age of twenty-two, when he first went to Dublin, he produced several large pictures, which decorated his father's house, such as "Aenas escaping with his Family from the Flames of Troy," "Susanna and the Elders," "Daniel in the Lions' Den," &c. At this period he also produced the painting which first brought him into public notice, and gained him the acquaintance and patronage of Edmund Burke. The picture was founded on an old tradition of the landing of St Patrick on the sea-coast of Cashel, and of the conversion and baptism of the king of that district by the patron saint of Ireland. It was exhibited in London in 1762 or 1763.

By the liberality of Burke and his other friends, Barry in the latter part of 1765 was enabled to go abroad. He went first to Paris, then to Rome, where he remained upwards of three years, from Rome to Florence and Bologna, and thence home through Venice. His letters to the Burkes, giving an account of Raphael, Michelangelo, Titian and Leonardo da Vinci, show remarkable insight. Barry painted two portraits of him abroad, an Adam and Eve, and a Philosopher, neither of them of any merit. Soon after his return to England in 1771 he produced his picture of Venus, which was compared, though with little justice, to the Galatea of Raphael, the Venus of Titian and the Venus de Medicis. In 1773 he exhibited his "Jupiter and Juno on Mount Ida." His
“Death of General Wolfe,” in which the British and French soldiers are represented in very primitive costumes, was considered as a falling-off from his great style of art. His fondness for Greek costume was assigned by his admirers as the cause of his reluctance to paint portraits. His failure to go on with a portrait of Burke which he had begun caused a misunderstanding with his early patron. The difference between them is said to have been widened by Burke’s growing intimacy with Sir Joshua Reynolds, and by Barry’s feeling some little jealousy of the fame and fortune of his rival “in a humber walk of the art.” About the same time he painted a pair of classical subjects, Mercury inventing the lyre, and Narcissus looking at himself in the water, the last suggested to him by Burke. He also painted a historical picture of Chiron and Achilles, and another of the story of Stratonic, for which last the duke of Richmond gave him a hundred guineas. In 1773 it was proposed to decorate the interior of St Paul’s with historical and sacred subjects; but the plan fell to the ground, from not meeting with the concurrence of the bishop of London and the archbishop of Canterbury. Barry was much mortified at the failure, for he had in anticipation fixed upon the subject he intended to paint—the rejection of Christ by the Jews when Pilate proposes his release. In 1773 he published An Inquiry into the real and imaginary Obstructions to the Acquisition of the Arts in England; vindicating the capacity of the English for the cultivation of the useful and elegant branches of learning, by proving the necessity of a public encouragement to the acquisition of knowledge, political and civil disensions, and lastly to the general direction of the public mind to mechanics, manufactures and commerce. In 1774 a proposal was made through Valentine Green to Reynolds, West, Cipriani, Barry, and other artists to ornament the great room of the Society for the Encouragement of Arts, Manufactures and Commerce in the Adelphi with historical and allegorical paintings. This proposal was at the time rejected by the artists themselves; but in 1777 Barry made an offer to paint the whole on condition of being allowed the choice of his subjects, and being paid by the society the expenses of canvas, paints and models. His offer was accepted, and he finished the series of pictures at the end of seven years to the entire satisfaction of the members of the society, who granted him two exhibitions, and at different periods voted him 50 guineas, their gold medal and 200 guineas. Of the six paintings making up the series, only one, that of the Olympic Games, shows any artistic power.

Soon after his return from the continent Barry had been chosen a member of the Royal Academy; and in 1783 he was appointed professor of landscape painting in the room of Mr Penny with a salary of £50 a year. Among other things, he insisted on the necessity of purchasing a collection of pictures by the best masters as models for the students, and proposed several of those in the Orleans collection. This recommendation was not relished, and in 1799 Barry was expelled from the academy, soon after the appearance of his Letter to the Dilettanti Society, a very amusing but eccentric publication, full of enthusiasm for his art and at the same time of contempt for the living professors of it. After the loss of his salary, a subscription was set on foot by the earl of Buchan to relieve him from his difficulties, and to settle him in a larger house to finish his picture of Pandora. The subscription amounted to £1000, with which an annuity was bought, but on the 6th of February 1806 he was seized with illness and died on the 22nd of the same month. On the 14th of March his remains were interred in St Paul’s.

As an artist, Barry was more distinguished for the strength of his conceptions, and for his resolute and persistent determination to apply himself only to great subjects, than for his skill in designing or for beauty in his colouring. His drawing is rarely good, his colouring frequently wretched. He was extremely impulsive and unequal; sometimes morose, sometimes sociable and urbane; jealous of his contemporaries, and yet capable of pronouncing a splendid eulogy on Reynolds.

BARRY, SIR REDMOND (1813–1886). British colonial judge, son of Major-General H. G. Barry, of Ballyclough, Co. Cork, was educated at a military school in Kent, and at Trinity College, Dublin, and was called to the Irish bar in 1858. He emigrated to Australia, and after a short stay at Sydney went to Melbourne, with which city he was ever afterwards closely identified. After practising his profession for some years, he became commissioner of the court of requests, and after the creation in 1851 of the colony of Victoria, out of the Port Phillip district of New South Wales, was the first solicitor-general with a seat in the legislative and executive councils. Subsequently he held the offices of judge of the Supreme Court, acting chief-justice and administrator of the government. He represented Victoria at the London International Exhibition of 1851 and at the Philadelphia Exhibition of 1876. He was knighted in 1860 and was created K.C.M.G. in 1877. Sir Redmond Barry was the first person in Victoria to take an interest in higher education, and induced the local government to expend large sums of money upon that object. He was the founder of the university of Melbourne (1853), of which he was the first chancellor, was president of the Melbourne public library (1854), national gallery and museum, and was one of the first to foster the volunteer movement in Australia. To his exertions is due the prosperity of the two institutions with which his memory is identified.

BARRY, SPRANGER (1719–1777), British actor, was born in Dublin on the 23rd of November 1719, the son of a silversmith, to whose business he was brought up. His first appearance on the stage was at the Smock Alley theatre on the 5th of February 1740. He first appeared at once his prosperity. His first London appearance was made in 1746 at Othello at Drury Lane. Here his talents were speedily recognized, and in Hamlet and Macbeth he alternated with Garrick, arousing the latter’s jealousy by his success as Romeo. This resulted in his leaving Drury Lane for Covent Garden in 1750, accompanied by Mrs Cibber, his Juliet. Both houses now at once put on Romeo and Juliet for a series of rival performances, and Barry’s impersonation was preferred by the critics to Garrick’s. In 1758 Barry built the Crow Street theatre, Dublin, and later a new theatre in Cork, but he was not successful as a manager and returned to London to play at the Haymarket, then under the management of Foote. As his second wife, he married in 1768 the actress Mrs Dancer (1734–1801), and he and Mrs Barry played under Garrick’s management, Barry appearing in 1767, after ten years’ absence from the stage, in Othello, his greatest part. In 1774 they both moved to Covent Garden, where Barry remained until his death on the 10th of January 1777. He was a singularly handsome man, with the advantage of height which Garrick lacked.

His second wife, Ann STREET BARRY, was born in Bath in 1734, the daughter of an apothecary. Early in life she married an actor of the name of Dancer, and it was as Mrs Dancer that she made her first recorded appearance in 1758 as Cordelia to Spranger Barry’s Lear at the Crow Street theatre. During the next nine years she played all the leading tragic parts, but without any great success, and it was not until she came to Drury Lane with Barry that her reputation advanced to the high point at which it afterwards stood. After his death, she remained at Covent Garden and married a man much younger than herself, named Crawford, being first billed as Mrs Crawford in 1778. Her last appearance is said to have been as Lady Randolph in Douglas at Covent Garden in 1798. This part, and that of Desdemona, were among her great impersonations; in both she was considered by some critics superior to Mrs Siddons, who expressed her fear of her in one of her letters. She died on the 20th of November 1801 and was buried in Westminster Abbey.

BARRY, an urban district and seaport of Glamorganshire, Wales, on the Bristol Channel, 153 m. by rail from London and 8 m. S.W. from Cardiff. Its station is a terminus on the Barry railway, which starts at Hafod in the Rhonda Valley, where it joins the Taff Vale railway, having also junctions with the same line for Aberdare and Merthyr at Trefoist, and for Cardiff and Penarth at Cogan, and with the Great Western main line at Peterstone and St Fagans. A branch from the main line at Tyn-y-caeau connects with the Rhynday railway, the London & North-Western railway, and the Brecon & Merthyr railway. The Vale of Glamorgan railway (which is worked by
the Barry company and has a junction with the Great Western railway at Bridgend) affords a direct route to Barry from the Llynvi, Ogmore and Garw coalfields. The urban district of Barry, with a population in 1901 of 27,936, comprises the ecclesiastical parishes of Barry, Cadwson, Merthyr-Dovan, and a portion of Sully in which is included Barry island (194 acres), now, however, joined to the mainland. The total population of this area in 1891 was only about 500, that of the village alone being only 85. A small brook named Barri runs here into the sea, whence the place was formerly known in Welsh as Aber-Barri, but the name of both the river and the island is supposed to be derived from Baruch, a Welsh saint of the 7th century, who had a cell on the island. His chapel (which still existed in Leland's time) was a place of pilgrimage in the middle ages. According to Giraldus, his own family derived its name de Barri from the island which they once owned. One of the followers of Fitzhamon settled at Barry about the end of the 11th century, building there a castle of which only a gateway remains. Besides the small old parish churches of Merthyr-Dovan and Cadwson, and the rebuilt parish church of Barry, there are four modern churches (in one of which Welsh services are held). There are about thirty nonconformist chapels, in nearly a third of which the services are Welsh. There are also a Roman Catholic church, and one for German and Scandinavian seamen. The other public buildings are a county intermediate school for 250 boys and girls, built in 1866, a free library (opened in 1867), with four branches and reading-rooms, a seaside hotel, and the Barry market, built in 1890 at a cost of 2,3500 (but now used as a concert-hall), and Romilly hall for public meetings.

Barry owes its seaport to the determination of a number of colliery owners to secure an alternative port to Cardiff, with an independent railway to it from the coalfields. After failing in 1883, they obtained parliamentary powers for this purpose in 1884, and the first sod of the new dock at Barry was cut in November of that year. The docks are 142 acres in extent, and have accommodation for the largest vessels afloat. Dock No. 1, opened on the 18th of July 1889, is 73 acres (with a basin of 7 acres) and occupies the eastern side of the old channel between the island and the mainland, having a well-sheltered deep-sea entrance. There is good anchorage between Barry and Sully islands. Dock No. 2 (34 acres) was opened on the 10th of October 1898. There are 41 acres of timber-ponds and three large graning-docks. For loading the coal there are thirty fixed and seven movable coal-hoists. The total tonnage of the exports in 1906 amounted to 6,757,526 tons, of which, except 26,491 tons of lead and 179,208 tons of hogsheads of the imports 2,066,102 tons.

BAR-SALIBI, JACOB or DIONYSIUS, the best-known and most voluminous writer in the Syrian Jacobite church of the 11th century, was, like Bar-Hebraeus, a native of Malatia on the Upper Euphrates. In 1154 he was created bishop of Mar'ash by the patriarch Athanasius VIII.; a year later the diocese of Mabibg was added to his charge. In 1166 Michael I., the successor of Athanasius, transferred him to the metropolitan see of Aimid in Mesopotamia, and there he remained till his death in 1171. A long account of his writings, with copious extracts from some of them, has been given by Assemani (Bibl. Orient., ii. pp. 156-211); and W. Wright (Syriac Literature, pp. 246-250) has added further particulars as to the MSS. in which they are contained. Probably the most important are his exhaustive commentaries on the text of the Old and New Testaments, in which he has skilfully interwoven and summarized the interpretations of previous writers such as Ephrem, Chrysostom, Cyril, Moses Bar-Képhá and John of Dárat, whom he mentions together in the preface to his commentary on St Matthew. Among his other main works are a treatise against heretics containing inter alia a polemic against the Jews and the Mahomedans; liturgical treatises, epistles and homilies. His commentaries on the Gospels were to some extent used by Dudley Loftus in the 17th century. But the systematic editing of his works was only begun in 1903 with H. Labouret's edition and translation of his Exposition of the Liturgy (Paris). His commentaries on the Gospels have been edited and translated by J. Sedláček and J. B. Chabot (Fasc. l., Paris, 1906), and the Syriac text of the treatise against the Jews has been edited by J. de Zwaan (Leiden, 1906). Bar-Salibi was undoubtedly an able theologian; his vigour combined with terseness in argument and an almost scholastic gift for exposition, in the instance of his commentary on St Matthew. Of his originality it is hard to judge, as he does not usually indicate in detail the sources of his arguments and interpretations. He does not, however, claim for himself to be more than a compiler, at least in his commentaries. His Syriac style is good, considering the lateness of the period at which he wrote.

BARSI, a town of British India, in the Sholapur district of Bombay, lying within a tract entirely surrounded by the Nizam's dominions. Pop. (1901) 24,242. Barsi is a flourishing centre of trade, exporting to Bombay large quantities of cotton and oil-seeds. It has several factories for ginning and pressing cotton—some on a large scale. It is connected with the main line of the Great Indian Peninsula railway by a light railway.

BAR-SUR-AUBE, a town of north-eastern France, capital of an arrondissement in the department of Aube, 34 m. E. by S. of Troyes on the main line of the Eastern railway between that town and Belfort. Pop. (1906) 4,726. Bar-sur-Aube lies at the foot of hills on the right bank of the Aube at its confluence with the Brenne. A circular boulevard occupies the site of the old town, fragments of which still remain. Of the chief public buildings, the most noteworthy are St Pierre and St Maclov, both dating mainly from the end of the 12th century. St Pierre has wooden exterior galleries and two fine Gothic porches. The sacristy of St Maclov is conjectured to have formed the chapel of the castle of the counts of Bar, of which the square tower flanking the north side of the church formed the entrance. The town is the seat of a sub-prefect, and the public institutions include a tribunal of first instance and a communal college. Flour-milling, tanning, and the manufacture of brandy, hosery and agricultural implements are carried on. The wine of the district is much esteemed.

Traces of a Roman settlement have been found on hills to the south of the town. Under the domination of the counts of Champagne, it became the scene of important fairs which did not cease till 1648. In 1814 several actions between the French and the army of the allies took place at Bar-sur-Aube (see NAPOLEONIC WARS).

BAR-SUR-SEINE, a town of eastern France, capital of an arrondissement in the department of Aube, on the left bank of the Seine, 20 m. S.E. of Troyes by the Eastern railway. Pop. (1906) 2,812. The town lies at the foot of a wooded hill on which stand the ruins of the castle of the counts of Bar, and is composed chiefly of one long street, bordered in places by houses of the 16th century. Its principal building is the church of St Etienne, of the 16th and 17th centuries, which contains some fine stained glass. Bar-sur-Seine has a sub-prefecture and a tribunal of first instance. Tanning, dyeing, flour-milling, brandy-distilling and the manufacture of glass are among the industries. The Canal de la Haute-Seine begins at this point. The town was devastated in 1359 by the English, when, according to Froissart, no fewer than 900 mansions were burnt. Afterwards it suffered greatly in the religious wars of the 16th century.

BART, JEAN (1651-1702), French naval commander, son of a fisherman, was born in Dunkirk on the 21st of October 1651. He served when young in the Dutch navy, but when war broke out between Louis XIV. and Holland in 1672 he entered the French service. He gained great distinction in the Mediterranean, where he held an irregular sort of commission, not being then able from his low birth to receive a command in the navy. His success was so great, however, that he was made a lieutenant in 1679. He rose rapidly to the rank of captain and then to that of admiral. The peace of Ryswick put a close to his active service. Many anecdotes are narrated of the courage and bluntness of the unctivated sailor, who became the popular hero
of the French naval service. The town of Dunkirk has honoured
his memory by a statue and by naming a public square after him.
See Riches, Vie de Jean Bart (1760), and many editions since;
Vanderer, Histoire de Jean Bart.

BARTAN, more correctly BARTIN, a town in the vilayet of
Kastamuni, Asiatic Turkey, retaining the name of the ancient
village Parthenia and situated near the mouth of the Bartan-su
(anc. Parthenius), which formed part of the boundary between
Bithynia and Paphlagonia. Various aetiological explanations
of the name Parthenius were given by the ancients, e.g. that the
maiden Artemis hunted on its banks, or that the flow of its waters
was gentle and maiden-like. The town, which is the residence of a
calitamakam, is built on two low limestone hills and its streets
are paved with limestone blocks. It is noted for the fine box-
wood grown in the vicinity, is a port of call for Black Sea coasting
steamers and carries on a considerable trade with Constantinople
which might be increased were it not for the obstruction of the
harbour by a bar. Pop. 8677, according to Cuinet, La Turquie
d'Asie (1864).

BARTELS, HANS VON (1856–1908), German painter, was born
in Hamburg, the son of Dr N. F. F. von Bartels, a Russian
government official. He studied first under the marine painter
R. Hardorff in Hamburg, then under C. Schwetzter in Düsseldorf
and C. Oesterley in Hamburg, and finally at the Berlin School
of Art. After travelling extensively, he settled in Munich in 1885
and was appointed professor of painting in 1891. An oil painter of
great power, he is one of the leading German water-colour painters,
maintly of marines and scenes of fishing life, painted with real
vigour and a great display of technical skill. He excels in storm scenes
and in depicting the strong, healthy fishing-folk of the northern coasts.

He became an honorary member of leading English, German, Dutch,
Belgian and Austrian art societies. Among his principal works are:
"Sturmflut" (Berlin Gallery); "Lonely Beach" (Hungarian
National Gallery); "Potato Harvest—Rügen" (Prague);
"Storm—Bornholm" (German emperor's collection); and
"Moonlight on the Zuyderzee" (New Pinakothek, Munich).

BARTENSTEIN, a town of Germany, in the kingdom of
Prussia, on the Alle, 34 m. S. of Königsberg by rail. Pop. (1900)
6805. It has a considerable trade in corn and live stock, and its
industries comprise foundry and carriage-building, tanneries,
breweries and potteries. Bartenstein is celebrated for the treaty
concluded here on the 26th of April 1807, between Prussia and
Russia.

BARTER (from Fr. barater, to truck, to exchange), the ex-
change of commodities for commodities, in contra-distinction
to the exchange of commodities for money. Barter was the
simplest form of trading among primitive communities, but its
inconveniences led, at an early stage of civilization, to the adoption
of metals as mediums of exchange. Barter, however, is still very
common in dealings with uncivilized peoples, and traders in
many countries find that the most satisfactory method of
effecting exchange is to furnish themselves with such commodities
as weapons, tools and ornaments, which are more readily taken
than money.

For the history of barter and the steps by which a system of
currency was gradually evolved, see Money. Consult also W. S.
Jevons, Money and the Mechanism of Exchange; A. Marshall,
Economics; W. Ridgeway, Origin of Currency and Weight Standards.

BARTET (REGNAULT), JEANNE JULIA (1854–1927), French
actress, was born in Paris and trained at the Conservatoire.
In 1872 she began a successful career at the Vaudeville, and in 1879
was engaged at the Comédie Française, of which she became a
sociétaire in 1880. For many years she played the chief parts
both in tragedy and comedy, her grand style and exquisite
finesse making her supreme among the younger actresses on the
French stage. She had a season in London in 1908, when her
consummate art was displayed in a number of parts.

BARTHE, HEINRICH (1821–1865), German explorer, was born
at Hamburg on the 16th of February 1821, and educated at
Berlin University, where he graduated in 1844. He had already
visited Italy and Sicily and had formed a plan to journey through
the Mediterranean countries. After studying Arabic in London
he set out on his travels in 1845. From Tangier he made his way
overland throughout the length of North Africa, visiting the
sites of the ancient cities of Barbary and Cyrenaica. He also
travelled through Egypt, ascending the Nile to Wadi Halfa and
crossing the desert to Berenice. While in Egypt he was attacked
and wounded by robbers. Crossing the Sinaï peninsula he
traversed Palestine, Syria, Asia Minor, Turkey and Greece,
everywhere examining the remains of antiquity; and returned
to Berlin in 1847. For a time he was engaged there as Privat-
docent, and in preparing for publication the narrative of his
Wanderungen durch die Küstenländer des Mittelmeeres, which
appeared in 1849.

At the instance of Bunsen and other scientists, Barth and
Adolf Overweg, a Prussian astronomer, were appointed colleagues
of James Richardson, an explorer of the Sahara who had been
selected by the British government to open up commercial
relations with the states of the central and western Sudan. The
party left Tripoli early in 1850, but the deaths of Richardson
(March 1851) and Overweg (September 1852) left Barth to carry
on the mission alone. He returned to Europe in September 1853,
and the most fruitful expeditions ever undertaken in
inner Africa. In addition to journeys across the Sahara, Barth
traversed the country from Lake Chad and Bagirmi on the east
and Timbuctu and Kano on the west, and became
involved with the Boxer War in China. He
had prolonged sojourns in the ancient sultanates or emirates
Boran, Kano, Nupe, Sokoto and Gando and at Timbuktu.
He studied minutely the topography, history, civilizations
and resources of the countries he visited. The story of his travels
was published simultaneously in English and German, under
the title Travels and Discoveries in North and Central Africa
(1857–1858, 5 vols.). For accuracy, interest, variety and extent
of information Barth's Travels have few rivals among works of
the kind. It is a book that will always rank as a standard
authority on the regions in question, of which a great part,
under the name of Nigeria, has since come under British rule.
Excepting a C.B., Barth himself received no recognition of his services
from the British government. He returned to Germany, where he
prepared a collection of Central African vocabularies (Gotha,
1862–1866). In 1858 he undertook another journey in Asia Minor,
and in 1862 visited Turkey in Europe. In the following year he
was appointed professor of geography at Berlin University and
president of the Geographical Society. He died at Berlin on the
25th of November 1865.

See Schubert's Heinrich Barth, der Bahnbrecher der deutschen
Afrikaforschung (Berlin, 1897). An edition of the Travels in two
volumes was published in London in 1890 Minerva Library of
Famous Books.

BARTH, KASPAR VON (1587–1658), German philologist, was
born at Küstrin in the province of Brandenburg on the 21st
of June 1587. He was an extremely precocious child, and
was looked upon as a marvel of learning. After studying at
Gotha, Eisenach, Wittenberg and Jena, he travelled extensively,
visiting most of the countries of Europe. Too independent to
accept any regular post, he lived alternately at Halle and on
his property at Sellerhausen near Leipzig. In 1636, his library
and MSS. at Sellerhausen having been destroyed by fire, he
removed to the Paulinum at Leipzig, where he died on the 17th
of September 1658. Barth was a very voluminous writer; his
works, which were the fruits of extensive reading and a retentive
memory, are unmethodical and uncritical and marred by want
of taste and of clearness. He appears to have been excessively
vain and of an unamiable disposition. Of his writings the most
important are: Adversaria (1624), a storehouse of miscellaneous
learning, dealing not only with classical but also with medieval
and modern writers; and commentaries on Claudian (1612, 1650)
and Statius (1664).

BARTH, a town of Germany, in the kingdom of Prussia, on the
Barther Bodden, a lake connecting with the Baltic, 15 m. N.W.
from Stralsund by rail. Pop. (1900) 7070. It contains a fine
Gothic Protestant church (St Mary's) dating from the 13th
century and has several educational establishments, notably a
school of seamanship. Its industries comprise iron-founding, ship-building, brewing, and the manufacture of cigars, leather and tinned fish. There is an active export trade in grain.

Barthélemy, Antoine Jean-Baptiste Antoine de (1821-1864), French archaeologist and numismatist, was born at Reims on the 1st of July 1821, and died at Ville d’Avray on the 27th of June 1904. In collaboration with J. Geslin de Bourgogne, he published Études sur la révolution en Bretagne in 1858, and between 1855 and 1879 an exhaustive work in six volumes on the Anciens états de Bretagne; histoire et monuments. In 1880 appeared the Choix de documents inédits sur l’histoire de la ligne en Bretagne, by himself alone. But it was, above all, his numismatic work which established his reputation. This included several popular publications, such as the Nouveau manuel complet de numismatique ancienne (1851; second edition, revised, 1896), and the Nouveau manuel complet de numismatique du moyen âge et moderne (1853; new edition revised by Adrien Planchet), and a large number of monographs and articles in the technical reviews. The following may be specially mentioned: Numismatique mérovingienne (1863); Essai sur la monnaie parisienne (1874); Note sur l’origine de la monnaie tournoisienne (1868); and in the series of instructions issued by the Comité du Bas-Niillon, his contributions to the section on numismatique, as well as his contribution on La Numismatique de la France (1891). In 1897 he was elected a member of the Académie des Inscriptions et Belles-lettres.

His younger brother, Édouard Marie, comte de Barthélémy, who was born in Angers in 1830, has published a number of documents upon the ancient French nobility and upon the history of Champagne.

Barthélemy, Auguste Marselle (1796-1867), French satirical poet, was born at Marseilles in 1796. His name can hardly be separated from that of his friend and compatriot, J. P. A. Méry (1798-1866), with whom he carried on so intimate a collaboration that it is not possible to distinguish their personalities in their joint works. After having established some local reputation as a poet, Barthélémy went to Paris, where by one of his first efforts, Le Sacre de Charles X (1825) he gained the favour of the court. His energies, however, were soon enlisted in the service of the opposition party. In 1825 appeared a clever political satire, Les Siècles, followed by La Villégiature ou la prise du château de Rivoli (1827), La Comédie des barons (1827), La Parisienneté (1827), and joint productions of Barthélémy and his brother. The success was immediate and pronounced; fifteen editions of the Villégiature were called for during the year. A rapid succession of political squibs and satires was now poured forth by the authors, among the most remarkable being Biographie des quarante de l’académie française (1836) and Napoléon en Égypte (1828), which passed through nearly a dozen editions in a year. In 1830 Barthélémy was imprisoned and fined 1000 francs for the publication of their Fils de l’homme, a poem on the duke of Reichstadt, Napoleon’s son. The Revolution of 1830 liberated him; and in company with Méry, he celebrated the triumph of the people in one of their most brilliant efforts, L’Insurrection. From March 1831 to April 1832 they produced a series of verse satires issued weekly, La Némésis, attacking the government and ministers of Louis Philippe. The small pension of which Barthélémy was the recipient was stopped. When the publication ceased there was a strong suspicion that Barthélémy had been paid for his silence. In 1833 he published an anonymous poem, supporting some acts of the government which were peculiarly obnoxious to the Liberal party. This change of front destroyed his influence and his later writings passed unnoticed. For the next few years he enjoyed a handsome pension from the government and refrained from all satirical writing. He again resumed his old style in 1844 but without the former success. From that date he contented himself with merely occasional poems. Barthélémy died on the 23rd of August 1867 at Marseilles.

Joseph Méry was an ardent romanticist and wrote a great number of stories now forgotten. He produced several pieces at the Paris theatres, and also collaborated with Gérard de Nerval in adaptations from Shakespeare and in other plays. He received a pension from Napoleon III. and died in Paris on the 16th of June 1866.

The Éuvres of Barthélémy and Méry were collected, with a notice by L. Reybaut, in 1831 (4 vols.). See also Barthélémy et Méry études spéciales dans leurs rapports avec la légende napoléonienne, by Jules Garsou in vol. lvii. of the Mémoires of the Académie Royale de Belgique, which contains full information on both authors.

Barthélemy, François, Marquis de (1747 or 1750-1830), French politician, was educated by his uncle the abbé Jean Jacques Barthélémy for a diplomatic career, and after serving as secretary of legation in Sweden, in Switzerland and in England, was appointed minister plenipotentiary in Switzerland, in which capacity he negotiated the treaties of Basel with Prussia and Spain (1795). Elected a member of the Directory in May 1795, through royalist influence, he was arrested at the coup d’état of the 18 Fructidor (17th of September 1797) and deported to French Guiana, but escaped and made his way to the United States and then to England. He returned to France after the 18 Brumaire, entered the senate in February 1800 and contributed to the establishment of the consulsiphi for life and the empire. In 1814 he abandoned Napoleon, took part in the drawing up of the constitutional charter and was named peer of France. During the Hundred Days he lived in concealment, and after the second Restoration obtained the title marquis, and in 1819 introduced a motion in the chamber of peers tending to render the electoral law more aristocratic.

Barthélemy, Jean Jacques (1716-1795) French writer and numismatist, was born on the 20th of January 1716 at Cassis, in Provence. He was educated first at the college of the Oratory in Marseilles, and afterwards at that of the Jesuits in the same city. While studying for the priesthood, which he intended to join, he devoted much attention to oriental languages, and was introduced by his friend M. Cary of Marseilles to the study of classical antiquities, particularly in the department of numismatics. In 1744 he went to Paris with a letter of introduction to M. Gros de Boze, perpetual secretary of the Academy of Inscriptions and Belles-lettres and keeper of the royal collection of medals. He became assistant to de Boze, on whose death (1753) he became keeper of the medals. In 1755 he accompanied the French ambassador, M. de Stainville, afterwards due de Choiseul, to Italy, where he spent three years in archaeological research. Choiseul had a great regard for Barthélémy, and on his return to France, Barthélémy became an inmate of his house, and received valuable preferences from his patron. In 1789, after the publication of his Voyage du jeune Anacharsis, he was elected a member of the French Academy. During the Revolution Barthélémy was arrested as an aristocrat. The Committee of Public Safety, however, were no sooner informed by the duchess of Choiseul of the arrest, than they gave orders for his immediate release, and in 1793 he was nominated librarian of the Bibliothèque Nationale. He refused this post but resumed his old functions as keeper of medals, and enriched the national collection by many valuable acquisitions. Barthélémy died on the 30th of April 1795.

Barthélemy was the author of a number of learned works on antiquarian subjects, but the great work on which his fame rests is Voyage du jeune Anacharsis en Grèce, vers le milieu du quatrième siècle avant l’ère chrétienne (4 vols., 1787). He began it in 1757 and had been working on it for thirty years. The hero, a Scythian descended (from the famous philosopher) Anacharsis, is supposed to repair to Greece for instruction in his early youth, and after making the tour of her republics, colonies and islands, to return to his native country and write this book in his old age, after the Macedonian hero had overthrown the Persian empire. In the manner of modern travellers, he gives an account of the customs, government and antiquities of the country he is supposed to have visited; a copious introduction supplies whatever may be wanting in respect to historical details; whilst various dissertations on the music of the Greeks, on the literature of the Athenians, and on the economy, pursuits, ruling passions, manners and customs of the surrounding states supply ample...
on the subject of which they treat. Modern scholarship has superseded most of the details in the *Voyage*, but the author himself did not imagine his book to be a register of accurately ascertained facts; he rather intended to give to his countrymen, in an interesting form, some knowledge of Greek civilization. The *Charidies* of W. A. Becker is an attempt in a similar direction, but, though superior in scholarship, it wants the charm of style of the *Anacharsis*.

Barthélemy’s correspondence with Paoli Paciaccidi, chiefly on antiquarian subjects, was edited with the *Correspondance inédite du comte de Caylus en 1877* by Ch. Nisard; his letters to the comte de Caylus were published in the *Annales de la République*: *Le Gloire* et *la Timide*, a devoted profession to the memory of his father, in his letters to Mme du Duffand, with whom he was on intimate terms, in the *Correspondance complète de Mme du Duffand avec la duchesse de Choiseul*, l’abbé Barthélémy et M. Carnafon (3 vols., 1866), editor of *La République*. See also *Mémoires sur la vie de l’abbé Barthélémy*, édité par lui-même (1824), with a notice by Lalande. *Les Études complètes* (4 vols. 1821), contain a notice by Villeneuve.

**BARThELÉMY SAINT-HILAIRE, JULES (1803–1859)**, French philosopher and statesman, was born at Paris on the 10th of August 1803. In his early years he was an active political journalist, and from 1826 to 1830 opposed the reactionary policy of the *Le Glaive* et *la Tongue*. At the Revolution of 1830 he signed the protestation of the journalists on the 28th of July 1830. After 1834 he contributed to different newspapers—*Le Constitutionnel*, *Le National* and the *Courrier français*—until 1835, when he gave up politics in order to devote himself to the history of ancient philosophy, undertaking a translation of Aristotle, which occupied him the greater part of his life (1837–1892). The reputation which he gained from this work won for him the chair of ancient philosophy at the *Collège de France* (1838) and a seat at the *Academy of Moral and Political Science* (1839). After the revolution of 1848 he was elected as a republican deputy; but was obliged to withdraw after the *coup d’état* of Louis Napoleon. In 1855 he went as member of the international commission to Egypt to report on the possibility of the proposed Suez canal, and by the articles which he wrote he contributed largely to making the project popular in France. Elected deputy again in 1860, he joined the opposition to the Empire, and in 1870 he went to the war, his efforts to the election of Thiers as president of the republic, acting afterwards as his secretary. Appointed senator for life in 1875, he took his place among the moderate republicans, and from September 1880 to November 1881 was minister of foreign affairs in the cabinet of Jules Ferry. The most important event of his administration was the annexation of Tunis under the form of a French protectorate, which he actively promoted. He died on the 24th of November 1895. His principal works, besides the translation of Aristotle and a number of studies connected with the same subject, are *Des Védas* (1854), *Du Bouddhisme* (1856) and *Mahomet et le Coran* (1865).

**BARTHÉLEMY, or BARTHELS, PAUL JOSEPH (1734–1806)**, French physician, was born on the 11th of December 1734 at Montpellier. He was educated at Narbonne and Toulouse, and began the study of medicine at Montpellier in 1750, taking his doctor’s degree in 1753. In 1756 he obtained the appointment of physiologist to the *Hospice Saint-Pothin*. In 1760 he was attached to the commission commanded by Marshal d’Estres, but a severe attack of hospital fever compelled him to leave this post. In 1757 his services were required in the medical staff of the army of Westphalia, where he had the rank of consulting physician, and on his return to Paris he acted as joint editor of the *Journal des savants* and the *Encyclopédie méthodique*. In 1759 he obtained a medical professorship at Montpellier, and in 1774 he was created joint chancellor of the university. In 1778 he published his most famous work, *Nouveaux éléments de la science de l’homme*, in which he employs the expression “vital principle” as a convenient term for the cause of the phenomena of life, without committing himself to either a spiritualistic or a materialistic view of its nature. Taking the degree of doctor of civil law in 1780, he secured the appointment of counsellor to the *Supreme Court of Aids* at Montpellier, but he soon took up his residence in Paris, having been nominated consulting physician to the king.

On the outbreak of the French Revolution he lost much of his fortune and retired to Carcassonne, where he devoted himself to the study of theoretical medicine. It was from this retreat that he sent to the court his *Nouveaux Éléments de la science de l’homme*, which appeared in 1798. In 1802 he published his *Traitement des maladies goutteuses*, and he afterwards occupied himself in preparing for the press a new edition of his *Éléments de la science de l’homme*, of which he just lived to see the publication. His health had been declining for some years before his death, which took place soon after his removal to Paris, on the 11th of October 1806. He bequeathed his books and manuscripts to J. Lordat, who published two volumes of his *Consultations de médecine* in 1810. His *Traité du beau* was also published posthumously in 1807.

**BARTHOLOMUS, GASPARD** (Caspar Berthenels, 1585–1629), physician, was born in 1585 at Malmö, in Sweden. His precocity was extraordinary; at three years of age he was able to read, and in his thirteenth year he composed Greek and Latin orations and delivered them in public. When he was about eighteen he went to the university of Copenhagen and afterwards studied at Leiden and Wittenberg. He then travelled through Germany, the Netherlands, England, France, and Italy, and was received with marked respect at the different universities he visited. In 1613 he was chosen professor of medicine in the university of Copenhagen, and filled that office for eleven years, when, falling into a dangerous illness, he made a vow that if he should recover he would apply himself solely to the study of divinity. He fulfilled his vow by becoming professor of divinity at Copenhagen and canon of Roskilde. He died on the 13th of July 1620 at Sorø in Zealand.

Of his sons, Thomas (1616–1680) was born at Copenhagen, where, after a long course of study in various universities of Europe, he was appointed successively professor of mathematics (1647) and anatomy (1648). During his tenure of the latter chair he distinguished himself by observations on the lymphatics. In 1661 he retired to Hagestaed. In 1670 his house and library were burnt, and in consideration of his loss he was appointed physician to the king with a handsome salary, and librarian to the university of Copenhagen. He died at Hagestaed in 1680. Another son, Erasmus (1625–1668), born at Roskilde, spent ten years in visiting England, Holland, Germany and Italy, and filled the chairs of mathematics and medicine at Copenhagen. He discovered double refraction in Iceland spar (*Experimenta crystalli islandicid disdiactastici*, Copenhagen, 1669). He died at Copenhagen in 1698. In the third generation, Caspar Thomesen (1655–1738), son of Thomas, also taught anatomy at Copenhagen, his name being associated with the description of one of the ducts of the sublingual gland and of the glandulae Bartholominae, while his younger brother, Thomas (1659–1690), was a student of northern antiquities who published *Antiquitatum Danicarum libri tres* in 1689.

**BARTHOLMEW, SAINT**, one of the twelve apostles, regarding whose early life we know nothing, unless in accordance with Paul and according to the Old Testament. He was, according to the *Post Resurrection* of Nathanael (g.n.). If so, Bartholomew is probably a patronymic, the apostle’s full name being Nathanael Bartolmai, i.e. the son of Tolmai. On the other hand, according to a Syrian tradition, Bartholomew’s original name was Jesus, which he dropped owing to its being the name of the Master Himself. In the synoptic gospels Bartholomew is never mentioned except in the lists of the apostles, where his name always appears after Philip’s. He is said to have gone, after the ascension of the Lord, on a missionary tour to India (then a very wide geographical designation) wherever, according to a story in Eusebius (*H. E. v. 10*), he left behind him a copy of St Matthew’s gospel. According to the traditional account he was slain alive and then crucified with his head downwards, at Albanopolis in Armenia, or, according to Nicephorus, at Urbanopolis in Cilicia. In works of art he is generally represented with a large knife, the instrument of his martyrdom, or, as in Michelangelo’s “Last Judgment,” with his own skin hanging over his arm. The festival of St Bartholomew is celebrated on the 24th of August.
Dr. Nestle has drawn attention to the fact that in the Greek translation of Ezechius' history the name Tolmai, i.e. Bartholomew, takes the place of Matthias, the apostle who was appointed in place of Judas (i.e. 12, cf. ii. 1, iii. 25 and 29). If this identification can be made out there would, in the list of apostles as finally constituted, be two men who bore the patronymic Bartholomew. See further Expository Times, ix. pp. 566 ff. (1898).

BARTHOLMEW, JOHN (1833-1893), Scottish cartogapher, was born at Edinburgh on the 25th of December 1831. His father had a cartographical establishment there and he was educated in the work. He was subsequently assistant to the German geographer August Petermann, until in 1856 he took up the management of his father's firm. For this establishment, now known as the Edinburgh Geographical Institute, Bartholomew built up a reputation unsurpassed in Great Britain for the production of the finest cartographical work. Among his numerous publications mention may be specially made of the series of maps of Great Britain reduced from the Ordnance Survey to scales of 1 in. and 1 in. to 1 m., with relief shown by contours and a systematic scale of colours. The 1 in. series, which was extended (and its principles applied to many other works) by Mr. J. B. Bartholomew, who succeeded his father in the business, is the finest of its kind ever produced. John Bartholomew died in London on the 24th of March 1893.

BARTHOLMEW FAIR, a fair held in West Smithfield, London, on St Bartholomew's Day (24th of August, O.S.) from 1133 to 1855. The charter authorizing its holding was granted by Henry I. to his former minstrel, Rahere, who had taken orders and had founded the priory of St Bartholomew close by. For many centuries the fair lasted a fortnight, but in 1601 it was shortened to four days only. In 1641 it had become so large that it involved no less than four parishes: Christ Church, Great and Little St Bartholomew's and St Sepulchre's. It was customary for the lord mayor of London to open the fair formally on St Bartholomew's Eve, and on his way to stop at Newgate where he received from the governor a cup of sack. In 1773, owing to the change in the calendar, the fair was proclaimed on the 3rd of September. During its earlier history the fair grew to be a vast national market and the chief cloth sale in the kingdom. Down to 1854 it was usual for the representative of the Merchant Taylors' Gild to proceed to the cloth fair which formed part of Bartholomew fair, and test the measures used for selling cloth there by the company's silver yard. The fair was finally closed in 1855.

For a full account see Prof. H. Morley, Memoirs of Bartholomew Fair (1859).

BARTICZAN (according to the New English Dictionary, from bartizan, a Scottish corruption of "bratticing" or "bratitish," from O. Fr. brattische, and meaning a battle-metted parapet; apparently first used by Sir Walter Scott), a small battlemented turret, corbelled out at the angle of a wall or tower to protect a warden and enable him to see around him. Bartizans generally are furnished with oyles or arrow-slits.

BARTLETT, JOHN (1826-1905). American publisher and compiler, was born in Plymouth, Massachusetts, on the 14th of June 1826. He became a bookseller and publisher in Cambridge, Mass., and from 1865 to 1889, when he retired, was a member of the bookselling and publishing firm of Little, Brown & Co., in Boston. In 1855 he published the first edition of his Familiar Quotations, subsequently greatly expanded and long the best-known collection of the sort, and in 1894 (although it had been copyrighted five years before), after many years' labour, he published his New and Complete Concordance or Verbal Index to Words, Phrases and Passages in the Dramatic Works of Shakespeare; with a Supplementary Concordance to the Poems—surpassing any of its predecessors in the number and fulness of its citations from the poet's writings. In all of his work he was greatly assisted by his wife, a daughter of Sidney Willard (1780-1851), the founder of the Bartletrie's Almanac and of the Bartletrie's Game and Fish Almanac. Bartlet died at Cambridge, Mass., on the 3rd of December 1905.

BARTLETT, JOHN RUSSELL (1805-1886). American historical and linguistic student, was born in Providence, Rhode Island, on the 23rd of October 1805. From his first to his eighteenth year he lived in Kingston, Canada; he was then in turn, from 1824 to 1836, a clerk in a dry goods store, a book-keeper and a bank cashier at Providence, and for more than ten years after 1850 was a bookseller in New York City, returning to Providence in 1850. In 1850-1853 he was the commissioner on the part of the United States for the survey of the boundary between the United States and Mexico, but owing to the lack of funds did not finish the work. After being superseded by another commissioner upon the accession of President Franklin Pierce, he published A Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora and Chihuhua (2 vols., 1854), which contains much valuable scientific and historical material concerning the south-west. From 1855 to 1872 he was secretary of state of Rhode Island, and while serving in this capacity thoroughly re-arranged and classified the state records, and prepared various bibliographies and compilations, relating chiefly to the history of the state. He is chiefly remembered however, for his Dictionary of Americanisms (1848), a pioneer work, which, although later dialect changes have, of course, deprived it of completeness or final authoritative ness, is still of value to the students of language and remains the chief contribution to the subject. He died in Providence on the 28th of May 1886.

BARTLETT, PAUL WAYLAND (1865- ), American sculptor, was born in New Haven, Connecticut, the son of Truman H. Bartlett, an art critic and sculptor. When fifteen he began to study at Paris under Frémiet, modelling from animals in the Jardin des Plantes. He won a medal at the Paris Salon of 1887. Among his principal works are: "The Bear Tamer," in the Metropolitan Museum of Art, New York; the equestrian statue of Lafayette, in the Place du Carrousel, Paris, presented to the French Republic by the school children of America; the powerful and virile Columbus and Michelangelo, in the Congressional Library, Washington, D.C.; the "Ghost Dancer," in the Pennsylvania Academy, Philadelphia; the "Dying Lion," the equestrian statue of McClellan in Philadelphia; and a statue of Joseph Warren in Boston, Massachusetts. His bronze patinas of reptiles, insects and fish are also remarkable.

BARTOLI, DANIELLO (1668-1685), Italian Jesuit priest, was born at Ferrara and entered the Society of Jesus in 1625. Debarred from the foreign mission field, he attained high distinction as a preacher and as a teacher of rhetoric in Genoa, Florence and Rome. He wrote (in Italian) a book called The Learned Man as a counterblast to the widespread reading of romances, and also a history of his order in 6 vols. (Rome, 1650-1673), which is particularly informing with regard to the early work of the society in Asia. He died at Rome.

A collected edition of his works, in 12 vols., was published by Marietti at Turin, 1825-1856; another in 50 vols. at Florence in 1826.

BARTOLINI, LORENZO (1777-1850), Italian sculptor, was born in Verino in Tuscany. After acquiring great skill and reputation as a modeller in alabaster, he went in 1797 to Paris, where he studied painting under Desmarées, and afterwards sculpture under F. Lecompt. The bas-relief "Cleobis and Biton," with which he gained the second prize of the Academy in 1801, at once established his fame as a sculptor and gained for him a number of influential patrons. He executed many minor pieces for Decon, besides busts of Mélù and Cherubini. His great patron, however, was Napoleon, for whom he executed a colossal bust, and who sent him to Carrara to found a school of sculpture. Here he remained till after the fall of Napoleon, and then took up his residence in Florence, where he resided till his death. His works are varied and include an immense number of busts. The best are, perhaps, the group of Charity, the "Hercules and Lichas" and the "Faith in God," which whilst exemplifying the highest types of Bartolini's style. Popular opinion in Italy associates his qualities as a sculptor with those of Thorwaldsen and Canova.

BARTOLOMEI, MARCUS FERDINAND (1821-1860), Italian revolutionist and statesman, who played an important part in the political events of Tuscany from 1848 to 1860. From the beginning of the revolutionary movement Bartolomei was always an ardent Liberal, and although belonging to an old and
BARTOLOMMEO—BARTOLUS 451

noble Florentine family his sympathies were with the democratic party rather than with the moderately liberal aristocracy. In 1847-1848 his house was a centre of revolutionary committees, and during the brief constitutional régime he was much to the fore. After the return of the grand duke Leopold II. in 1849 under Austrian protection, Bartolommei was present at a requisit service in the church of Santa Croce for those who fell in the late campaign against Austria; on that occasion disorders occurred and he was relegated to his country estate in consequence (1851). Shortly afterwards he was implicated in the distribution of seditious literature and exiled from Tuscany for a year. He settled at Turin for a time and established relations with Cavour and the Piedmontese liberals. He subsequently visited France and England, and like many Italian patriots became enamoured of British institutions. He returned to Florence in 1853; from that time onward he devoted himself to the task of promoting the ideas of Italian independence and unity among the people, and although carefully watched by the police, he kept a secret printing-press in his palace in Florence. Finding that the nobility still hesitated at the idea of uncompromising hostility to the house of Lorraine, he allied himself more firmly with the popular party, and found an able lieutenant in the baker Giuseppe Dolfi (1818-1869), an honest and whole-hearted enthusiast who had great influence with the common people. As soon as war between Piedmont and Austria appeared imminent, Bartolommei organized the expedition of Tuscan volunteers to join the Piedmontese army, spending large sums out of his own pocket for the purpose, and was also president of the Tuscan branch of the Società Nazionale (see under La Farina and Cavour). He worked desperately hard for the overthrow of the grand duke, assisted by all the liberal elements, and on the 27th of April 1859, Florence rose as he had so confidently foreseen to fire on the people, and the grand duke departed, never to return. Soprati! pes un carieux cassel was the comment of the French minister to Tuscany on this bloodless revolution. A provisional government was formed and Bartolommei elected gonfaloniere. He had much opposition to encounter from those who still believed that the retention of the grand duke as a constitutional sovereign and member of an Italian federation was possible. In the summer elections were held, and on the meeting of parliament Bartolommei's unitarian views prevailed, the assembly voting the resolution that the house of Lorraine had forfeited its rights and that Tuscany must be united to Italy under King Victor Emmanuel. Bartolommei was made senator of the Italian kingdom and received various other honours. His last years were spent in educational and philanthropic work. He died on the 15th of June, 1869, leaving a widow and two daughters.

The best biography of Bartolommei is contained in II Rivolvento Toscano e l'azione popolare, by his daughter Matilde Gioli (Florence, 1905), but the author attributes perhaps an undue preponderance to her father in the Tuscan revolution, and is not quite fair towards Bettino Ricasoli (q.v.) and other leaders of the aristocratic party. Cf. Lettere e documenti di B. Ricasoli (Florence, 1867-1866), and D. Zanichelli's Lettere politiche di B. Ricasoli, U. Peruzzi, N. Corsini, e C. Ridolfi (Bologna, 1898).

BARTOLOMEO DI PAGHOLI, Fra (1475-1517), the Italian historical and portrait painter,—known also as BACCIO (short for Bartolommeo) DELLA PORTA (because he lived near the Porta Romana), was born at Soffignano, near Florence, in 1475, and died at Florence in 1517. He received the first elements of his artistic instruction from Cosimo Rosselli; and after leaving him, devoted himself to a study of the great works of Leonardo da Vinci. Of his early productions, which are distinguished for their grace and beauty, the most important is the fresco of the Last Judgment, in which he was assisted by his friend Mariotto Albertinelli. While he was engaged upon some pieces for the convent of the Dominican friars, he made the acquaintance of Savonarola, who quickly acquired great influence over him, and Bartolommei was so affected by his cruel death, that he soon after entered the convent, and for some years gave up his art. He had not long resumed it, in obedience to his superior, when Raphael came to Florence and formed a close friendship with him. Bartolommei learned from the youngest artist the rules of perspective, in which he was so skilled, while Raphael owes to the fraile the improvement in his colouring and handling of drapery, which was noticeable in the works he produced during their meeting. Some years afterwards he visited Rome, and was struck with admiration and a feeling of his own inferiority when he contemplated the masterpieces of Michelangelo and Raphael. With the latter, however, he remained on the most friendly terms, and when he departed from Rome, left in his hands two unfinished pictures which Raphael completed. Fra Bartolommei's figures had generally been small and draped. These qualities were alleged against him as defects, and to prove that his style was not the result of want of power, he painted the magnificent figure of St Mark (his masterpiece, at Florence), and the undraped figure of St Sebastian. The latter was so well designed, so naturally and beautifully coloured, and so strongly expressive of suffering and agony, that it was found necessary to remove it from that place where it had been exhibited in the chapel of a convent. The majority of Bartolommei's compositions are altar-pieces. They are remarkable for skill in the massing of light and shade, richness and delicacy of colouring, and for the admirable style in which the drapery of the figures is handled, Bartolommei having been the first to introduce and use the lay-figure with joints.

BARTOLOZZI, FRANCESCO (1725-1815), Italian engraver, was born at Florence. He was originally destined to follow the profession of his father, who was a gold- and silver-smith; but he manifested so much skill and taste in designing that he was placed under the superintendence of two Florentine artists, who instructed him in painting. After devoting three years to that art, he went to Venice and studied engraving. He made very rapid progress, and executed some works of considerable importance at Venice. He then removed for a short time to Rome, where he completed a set of engravings representing events from the life of St Nilus, and, after returning to Venice, settled for London in 1764. For nearly forty years he resided in London, and produced an enormous number of engravings, the best being those of Clytie, after Annibale Caracci, and of the Virgin and Child, after Carlo Dolce. A great proportion of them are from the works of Cipriani and Angelica Kauffmann. Bartolozzi also contributed a number of plates to Boydell's Shakespeare Gallery. In 1782 he was invited to Lisbon as director of the National Academy. He remained in Portugal till his death. His son Gaetano Stephano (1757-1831) also an engraver, was the father of Madame Vestris.

BARTULUS (1314-1357), Italian jurist, professor of the civil law at the university of Perugia, and the most famous master of the dialectical school of jurists, was born in 1314, at Sassoferrato, in the duchy of Urbino, and hence is generally styled Bartolus de Saxoferrato. His father was Franciscus Severi, and his mother was of the family of the Alfani. He studied the civil law first of all under Cinus at Perugia, and afterwards under Oldrados and Jacobus de Belvisio at Bologna, where he was promoted to the degree of doctor of civil law in 1334. His great reputation dates from his appointment to a chair of civil law in the university of Perugia, 1343, where he lectured for many years, raising the character of the law school of Perugia to a level with that of Bologna. He died in 1357 at Perugia, where a magnificent monument recorded the interment of his remains in the church of San Francisco, by the simple inscription of "Osa Bartoli." Bartolus left behind him a great reputation, and many writers have sought to explain the fact by attributing to him the introduction of the dialectical method of teaching law; but this method had been employed by Odofredus, a pupil of Accursius, in the previous century, and the successors of Odofredus had abused it to an extent which has rendered the writings in many instances unprofitable to read, the subject matter being overlaid with dialectical forms. It was the merit of Bartolus, on the other hand, that he employed the dialectical method with advantage as a teacher, and disentangled the abuse of it; but his great reputation was more probably owing to the circumstance that he revived the exegetical system of teaching law (which had been
neglected since the ascendency of Accursius) in a spirit which gave it new life, while he imparted to his teaching a practical interest, from the judicial experience which he had acquired while acting as assessor to the courts at Todli and at Pisa before he undertook the duties of a professorial chair. His treatises *On Procedure* and *On Evidence* are amongst his most valuable works, whilst his *Commentary on the Code of Justinian* has been in some countries regarded as of equal authority with the code itself.

**BARTON, BENJAMIN SMITH** (1766–1815). American naturalist, was born at Lancaster, Pennsylvania, in 1766, studied for two years at Edinburgh, and afterwards graduated at Göttingen. He settled at Philadelphia, and soon obtained a considerable practice. In 1789 he was appointed professor of botany and natural history in the College of Philadelphia, now the University of Pennsylvania; he was made professor of *materia medica* in 1795, and on the death of Dr Benjamin Rush in 1813 he obtained the chair of practical medicine. In 1802 he was chosen president of the American Philosophical Society, of which he was a strong supporter. Barton was the author of various works on natural history, botany and *materia medica*, *his Elements of Botany* (1803) being the best known. He died at Philadelphia on the 10th of December 1815.

**BARTON, BERNARD** (1784–1849). English poet, was born at Carlisle on the 31st of January 1784. His parents were Quakers, and he was commonly known as the Quaker poet. After some experience of business, he became, in 1809, clerk to Messrs Alexander's bank at Woodbridge, Suffolk, and retained this post till his death. His first volume of verse—*Metrical Effusions*—was published in 1812. It brought him into correspondence with Southey, and shortly afterwards, through the medium of a set of complimentary verses, he made the acquaintance of Hogg. From this time onwards to 1828 Barton published various volumes of verse. After 1828 his work appeared but rarely in print, but his *Household Verses* published in 1845 secured him, on the recommendation of Sir Robert Peel, a Civil List pension of £100 a year, £200 having already been raised for him by some members of the Society of Friends. Barton is chiefly remembered for his friendship with Charles Lamb, which arose, curiously enough, out of a remonstrance addressed by him to the author of *Essays of Elia* on the freedom with which the Quakers had been handled in that volume. Lamb entertained for Barton a deep and enduring sympathy, and his bank clerkship and supporting himself entirely by literature, Lamb strongly dissuaded him. "Keep to your bank," he wrote, "and the bank will keep you." Barton died at Woodbridge on 19th February 1849. His daughter Lucy married Edward FitzGerald.

See Poems and Letters of Bernard Barton, selected by Lucy Barton, with a biographical notice by Edward FitzGerald (1849).

**BARTON, CLARA** (1821— ), American philanthropist, was born in Oxford, Massachusetts, in 1821. She was educated at the Clinton Liberal Institute (then in Clinton, New York). Ill-health compelled her to give up the profession of teaching, which she had taken up when she was only sixteen years old, and from 1854 to 1857 she was a clerk in the Patent Office at Washington. During the Civil War she distributed large quantities of supplies for the relief of wounded soldiers; and at her close she organized at Washington a bureau of records to aid in the search of missing men for whom inquiries were made. In connexion with this work, which was continued for about four years, she identified and marked the graves of more than two thousand Union soldiers interred in the National Cemetery at Gettysburg, Georgia. In 1866 she went for her health to Switzerland. Upon her arrival at Geneva she was visited by members of the International Committee of the Red Cross, who sought her co-operation in the work of their society. The United States had declined to become a party to the treaty of Geneva on the basis of which the Red Cross Society was founded, but upon the outbreak of the Franco-Prussian War Miss Barton went with members of this society to the seat of hostilities and assisted them in organizing their military hospitals. In 1871 she superintended the distribution of relief to the poor in Strassburg, and in 1872 performed a like service in Paris. For her services she was decorated with the Iron Cross by the German emperor. In 1873 she returned to the United States, where she at once began her efforts to effect the organization of the United States branch of the Red Cross and to bring her country into the treaty of Geneva, which efforts were successful in 1881–1882. She was the first president of the American Red Cross, holding the position until 1904; and represented the United States at the International conference held at Geneva, 1884; Karlsruhe, 1887; Rome, 1892; Vienna, 1897; and St Petersburg, 1903. She was the author of the American amendment to the constitution of the Red Cross which provides that the society shall distribute relief not only in war but in times of such calamities as famines, floods, earthquakes, cyclones, and pestilence, and in accordance with this amended constitution, she conducted the society's relief for sufferers from the yellow fever in Florida (1887), the flood at Johnstown, Pennsylvania (1889), the famine in Russia (1891), the hurricane along the coast of South Carolina (1893), the massacre in Armenia (1896), the Spanish-American War in Cuba (1898), the hurricane at Galveston, Texas (1900), and several other calamities. Upon her retirement from the Red Cross she incorporated and became president of "The National First Aid of America for first aid to the injured." She wrote *A Preliminary History of the Red Cross* (1882), *The Red Cross in Peace and War* (1892), *A Story of the Red Cross* (1904), and *Story of my Childhood* (1907).

**BARTON, ELIZABETH** (c. 1506–1534), "the maid of Kent," was, according to her own statement, born in 1506 at Aldington, Kent. She appears to have been a neurotic girl, subject to epilepsy, and an illness in her nineteenth year resulted in hysteria and religious mania. She was at the time a servant in the house of Thomas Cobb, steward of an estate near Aldington owned by William Warham, archbishop of Canterbury. During her convalescence she passed into trances lasting for days at a time, and in this state her ravings were of such "marvellous holiness in rebuke of sin and vice" that the country folk believed her to be inspired. Cobb reported the matter to Richard Masters, the parish priest, who in turn acquainted Archbishop Warham. The girl having recovered, and finding herself the object of local admiration, was cunningly enough, as she confessed at her trial, to feign trances, during which she continued her prophecies. Her fame steadily growing, the archbishop in 1526 instructed the dean of Canterbury, Warham, to send two of his monks to hold an inquiry. The monks, after their investigation, under Bocking, obtained her admission as a nun to St Sepulchre's convent, Canterbury. Under Bocking's instruction Barton's prophecies became still more remarkable, and attracted many pilgrims, who believed her to be, as she asserted, in direct communication with the Virgin Mary. Her utterances were cunningly directed towards political matters, and a profound and widespread sensation was caused by her declaration that should Henry persist in his intention of divorcing Catherine he "should no longer be king of this realm . . . and should die a villain's death." Even such men as Fisher, bishop of Rochester, and Sir Thomas More, corresponded with Barton. On his return from France in 1532 Henry passed through Canterbury and is said to have allowed the nun to force herself into his presence, when she made an attempt to terrify him into abandoning his marriage. After its solemnization in May 1533, her utterances becoming still more treasonable, she was examined before Cranmer (who had in March succeeded to the archbishopric on Warham's death) and confessed. On the 25th of September, Bocking and one monk, Hadley, were brought, and in November, Masters and others were implicated. The maid and her fellow prisoners were examined before the Star Chamber, and were by its order publicly exposed at St Paul's Cross, where they each read a confession. In January 1534 by a bill of attainder the maid and her chief accomplices were condemned to death, and were executed at Tyburn on the 20th of April. It has been held that her confession was extracted by force, and therefore valueless, but the evidence of her imposture seems conclusive.

and the English Monasteries (ch. iii. 1899 ed.); T. E. Bridgett, Life of Blessed John Fisher (1888); vols. vi. and vii. of "Letters and Papers of Henry VIII."); James Gairdner, The English Church in the 16th Century (1890); Stryte, Memorials, i. 1. 271, and Cronner; a detailed account of the case is contained in the published Act of Attainder 25 Henry VIII. c. 12.

BARTON BEDS, in geology, the name given to a series of soft-silt grey and brown clays, with layers of sand, of Upper Eocene age, which are found in the Hampshire Tertiary basin, where they are particularly well exposed in the cliffs of Barton, Hordwell, and in the Isle of Wight. Above the highly fossiliferous Barton Clay there is a sandy series with few fossils; these are the Headon Hill or Barton Sands. Either of these names is preferable to the term "Upper Bagshot Beds," which has been applied to these sands. The Barton Beds are absent from the London basin, and the Upper Bagshot Sands of that area are probably at a lower horizon than the Barton Sands. The term "Bartonien" was introduced by Mayer-Eymar in 1857 for the continental equivalents of the series.

Hampshire basin and Isle of Wight.

Barton Sands 140-200 ft. (Limestone of St Ouen.)
Barton Clay 162-255 ft. (sables moyens.)

Fusus longaevus, Volutotiites lacteatus, Ostrea gigantea, Pectunculus (Glycimeris) delecta are characteristic fossils; fishes (Lamna, Ario, &c.) and a crocodile (Diplodyodon) are also found in the Barton Clay. The sands are very pure and are used in glass making.

BARTON-UPON-HUMBER, a market town in the N. Lindsey or Brigg parliamentary division of Lincolnshire, England, the terminus of a branch of the Great Central railway, 44 m. N. by E. of Lincoln. Pop. of urban district (1901) 5071. It lies beneath low hills, on flat ground bordering the Humber, but the centre of the town is a mile from the river. The church of St Peter has a remarkable west tower of pre-Conquest workmanship, excepting the early Norman top storey. Against the western face is a low building of the date of the lower tower storeys, measuring 15 ft. by 12, with rude, deeply-splayed windows. The tower itself is arched in the two lower storeys, having round arches in the lower and triangular in the upper, and there is a round-headed S. doorway and a triangular-headed N. doorway. The rest of the church is Decorated and Perpendicular. The church of St Mary is fine Early English with Perpendicular clerestory. Industries include brick-making, malting, and rope-making. Barton appears in Domesday, when the ferry over the Humber existed. As a port, moreover, it subsequently rose into some importance, for it was able to supply eight ships and men to the expedition of Edward III. to Brittany.

BARUCH, the name (meaning "Blessed" in Hebrew) of a character in the Old Testament (Jer. xxxvi., xxxvii., xlii.), associated with the prophet Jeremiah, and described as his secretary and spokesman.

BOOK OF BARUCH. This deuterocanonical book of the Old Testament is placed by the LXX. between Jeremiah and Lamentations, and in the Vulgate after Lamentations. It consists of several parts, which cohere so badly that we are obliged to assume plurality of authorship.

Contents.—The book consists of the following parts:—
1. i.—14. The historical preface with a description of the origin and purpose of the book.
2. i.—15-ii. 5. A confession of sin used by the Palestinian Remnant. This confession was according to i. 14 sent from Babylon (i. 4, 7) to Jerusalem to be read "on the day of the feast and on the days of the solemn assembly." The confession is restricted to the use of the remnant at home (see next paragraph). In this confession there is a national acknowledgment of sin and a recognition of the Exile as a righteous judgment.
3. i. 6—iii. 8. A confession of the captives in Babylon and a prayer for restoration. This confession opens as the former (in i. 15) with the words found also in Daniel i. 7, "To the Lord our God belongeth righteousness, &c." The confession is of the Exiles and not of the remnant in Palestine, as Marshall has pointed out. Thus it is the Exiles clearly who are speaking in i. 13, "We are but a few left among the heathen, where thou hast scattered us?", ii. 14, "Give us favour in the sight of them which have led us away captive?", iii. 7, "We will praise thee in our captivity?", iii. 8, "We are yet this day in our captivity where thou hast scattered us." On the other hand the speakers in the confession in i. 15-5 is clearly the remnant in Jerusalem. i. 15, "To the Lord our God belongeth righteousness, but unto us confusion of face... to the men of Judah and the inhabitants of Jerusalem." The Exiles are mentioned by way of contrast to the speakers; ii. 4, 5, "He hath given them to be in subjection to all the kingsdoms that are round about us to be a reproach among all the people round about where the Lord hath scattered them. Thus were they cast down... because we sinned against the Lord our God."1
4. iii. 9-iv. 4. The glorification of wisdom, that is, of the Law. Israel is bidden to walk in the light of it; it is the glory of Israel and is not to be given to another.
5. iv. 5-21. Consolation and comfort with the promise of deliverance and lasting glory and blessing to Jerusalem.

Inerr.-From the foregoing description it seems clear that the book is derived from a plurality of authors. Most scholars, such as Fritzsche, Hitzig, Kneucker, Hilgenfeld, Reuss, agree in assuming that i.—iii. 8 and iii. 9-iv. 9 are from distinct writers. But some critics have gone farther. Thus Rothstein (Kautzsch, Apok. und Pseud. ii. 213-215) holds that there is no unity in iii. 9-iv. 9, and that it is composed of two independent writings—iii. 9-iv. 4 and iv. 5-iv. 9. Marshall (Hastings' Bible Dictionary, i. 251-254) gives a still more complex analysis. He finds in it the work of four distinct writers: i. 1-14, i. 15-iii. 8, iii. 9-iv. 4, iv. 5-iv. 9. The evidence for a fourfold authorship is strong though not convincing. In any case i.—iii. 8 and iii. 9-iv. 9 must be ascribed to different authors.

Original Language.—(1) Some scholars, as Ewald, Kneucker, Davidson, Rothstein and Künig, believe that the whole book was originally written in Hebrew; (2) Fritzsche, Hilgenfeld, Reuss, Gifford, Schürer, and Toy advocate a Hebrew original of part, and a foreign original of the rest; (3) Marshall argues that i.—iii. 8 is translated from a Hebrew original, but from Aramaic, and the rest from the Greek; and (4) lastly, Bertholdt, Havernick and Nöldeke regard the Greek as the primitive text. The last view must be put aside as unworkable. For the third no convincing evidence has been adduced, nor does it seem likely that any can be. We have therefore to decide between the two remaining theories. In any case we can hardly err in admitting a Hebrew original of i.—iii. 8. For (1) we have such Hebraisms as odb... avri wry... wry (ii. 20); odb... khr... wry (iii. 14, 29; iii. 8); on... ro jr... on (ii. 7). (2) We have meaningless expressions which are really mistranslations of the Hebrew. It is noteworthy that these mistranslations are for the most part found in Jeremiah—a fact which has rightly drawn scholars to the conclusion that we owe the LXX of Baruch i.—iii. 8, and of Jeremiah to the same translator. Thus in i. 9 we have movsq, "prisoner," where the text had rçb and the Greek should have rendered "locksmith." The same mistranslation is found in Jer. xxiv. 1, xxvi. (xxiv. 2). Next in ii. 4 we have ãbrw, "wilderness," where the text had rçb and the translation should have ãbrw. The same misrendering is found several times in Jeremiah. Again ãbrw is used in i. 22, i. 21, 22, 24 as a translation of rçb in the sense of "serving," where ãbrw ought to have been the rendering. See also in Jer. xxvii. (xxv. 11), xxxvii. (xxx.) 8, &c. Again in pλαγνον ιωάννα και ξέβοντα ἵστασαι τον ξέβον the ãbrw is a mistranslation of ãbrw as in Jer. xi. 6, xl.

1 Toy (Jewish Enc. ii. 556) thinks that the "them" in ii. 4, 5 may be a scribal slip and that we have here not the confession of the Palestinian remnant and that of the Exiles, but simply a juxtaposition of two forms of confession.
BARUCH

(33xiii.) 10, &c., where the translator should have given παρακαλεῖν. For ἀμαρτωλός (ii. 28) we should have παρακάτων.

(3) Finally there are passages where by re-translation we discover that the translator either misread his text or had a corrupt text before him. Thus μαρτωλός in i. 10 is a corrupt translation of μαρτωλοῦ as elsewhere in a dozen passages of the LXX.

In i. 4. τιθέναι = τε — which the translator should have read as τε = ἀνθρώπων.

From the above instances, which could be multiplied, we have no hesitation in postulating a Hebrew original of i.-iii. 8.

As regards iii. 9-13, if the passage is free from such notable Hebraisms as we have just dealt with, and no convoluted thoughts have been advanced to prove that it is a translation from a Semitic original.

Date.—The dates of the various constituents of the book are quite uncertain. Ewald, followed by Gifford and Marshall, assigns 1. i.-iii. 8 to the period after the conquest of Jerusalem by Tolemey I. in 320 B.C.; Reuss to some decades later; and Fritzsche, Schrade, Keil and Toyn to the time of the Maccabees. Hitzig, Kneucker and Schürer assume that it was written after 70 B.C. Ryle and James (Pis. of Solomon, pp. lxxi.-lxxvii.) hold that iv. 1-9 is dependent on the Greek version of Ps. xi., and that, accordingly, Baruch was reduced to its present form after a.D. 70. The most probable of the above dates appears to be that maintained by Fritzsche, that is, if we understand by the Maccabean the early decades of the 2nd cent. B.C. For during the palmy days of the Maccabean dynasty the Twelve tribes were supposed to be in Palestine. The idea that the Jewish Kingdom embraced once again the entire nation easily arose when the Maccabees extended their dominion northwards over Samaria and Galilee and eastwards beyond the Jordan. This belief displaced the older one that the nine and a half tribes were still in captivity. With the downfall of the Maccabean dynasty, however, the older idea revived in the 1 cent. A.D. To the beginnings of the 2nd cent. A.D. the view of the dead given in ii. 17 would point, where it is said that those whose spirits had been taken from their bodies would not give glory unto the Lord. The statement as to the desolate condition of the Temple in ii. 19 is with Kneucker to be rejected as an interpolation.

Canonicity.—The Book of Baruch was never accepted as canonical by the Palestinian Jews (Baba Batra 14b), though the Apostolic Constitutions, iii. 10, state that it was read in public worship on the 10th day of the month Gorpiæus, but this statement can hardly be correct. It was in general use in the church till its canonicity was rejected by the Protestant churches and accepted by the Roman church at the council of Trent.

Literature. Versions and Editions.—The versions are the two Latin, a Syriac, and an Arabic. The Latin one in the Vulgate belongs to a time prior to Jerome, and is tolerably literal. Another, somewhat later, was first published by Jos. Maria Caro in 1688, and was reprinted by Sabatier, side by side with the ante-Hieronymian one, in his Bibliorum Sacrorum Latinarum Versiones Antiquae. It is founded upon the preceding one and is less literal. The different and eccentric versions, printed in the London Polyglot, are literal. The Hexaplar-Syracuse version made by Paul, bishop of Tella, in the beginning of the 5th century has been published by Ceriani.

The most convenient editions of the Greek text are Tischendorf's in the second volume of his Septuagint, and Swete's in vol. iii.; Fritzsche's in Liber Apocryphi Veteris Testamenti Graece (1874). The best editions of the book are Kneucker's Das Buch Baruch (1870); Gifford's in the Speaker's Apoc. ii. See also the articles in the Encyc. Biblica, Hastings' Bible Dictionary; Schürer, History of Jewish People.

APOCALYPSE OF BARUCH. The discovery of this long lost apocalypse was due to Ceriani. This apocalypse has survived only in the Syriac version of which Ceriani discovered a 6th century MS. in the Milan library. Of this he published a Latin translation in 1866 (Monumenta Sacra, I. ii. 73-98), which Fritzsche reproduced in 1871 (Libri Apocryphi V.T., pp. 654-690), and the text in 1871 (Mon. Sacra, V. i. 113-140), and subsequently in photo-lithographic facsimile in 1883. Chaps. lxxxviii.-lxxxvii, indeed, of this book have long been known. These constitute Baruch's epistle to the nine and a half tribes in captivity, and have been published in Syriac and Latin in the London and Paris Polyglots, and in Syriac alone from one MS. in Lagarde's Libri V. T. Apocryphi Syc. (1861); and by Charles from ten MSS. (Apocalypse of Baruch, 1886, pp. 124-167). The entire book was translated into English by the last-named writer (op. cit. pp. 1-167), and into German by Ryssel (Kautzsch's Apok. und Pseu., 1900, ii. pp. 413-446).

The Syriac is translated from the Greek; for Greek words are occasionally transliterated, and passages can be explained only on the hypothesis that the wrong alternative meanings of certain Greek words were followed by the translator. The Greek in turn is derived from the Hebrew, for unintelligible expressions in the Syriac can be explained and the text restored by retranslation into Hebrew. Thus in xxii. 9, 11, 12, xxiv. 2, liii. 7 we have an unintelligible antithesis, "those who sin and those who are justified." The source of the error can be discovered by retranslation. The Syriac in these passages is a stock rendering of ḫwiaxwēlē and this in turn of παρακάτων, but παρακάτων does not mean only ḫwiaxwēlē, but also ḫwataxēlē, and this is the very meaning required by the context in the above passages: "those who sin and those who are righteous." Again xliii. 12 the text reads: "the new world which does not turn to corruption those who depart with its beginning and has no mercy on those who depart to torment." Here "on its beginning" is set over antithetically against "to torment," whereas the context requires "to its blessedness." The words "on its beginning" — ḫwiax — a corruption of παρακάτων, is to its blessedness. Again in lvi. 6 it is said that the fall of man brought grief, anguish, pain, trouble and "boasting" into the world. The term "boasting" in this connexion cannot be right. The word ᾿αστίζων is, corrupt for ᾿ασίζω, "disease." A further ground for inferring a Hebrew original is to be found in the fact that paronomasticum is often come discover themselves in the course of retranslation into Hebrew. One instance will suffice. In xlviii. 35, "Honour will be turned into shame, strength humiliated in contempt ... and beauty will become a scorn" contains three such: ἡ δόξα ἡ δόξα ἡ δόξα ἡ δόξα ἡ δόξα ἡ δόξα ἡ δόξα ἡ δόξα ἡ δόξα (see Charles, Apoc. Bar. pp. xlviii.iiii.). The necessity of postulating a Hebrew original was first shown by the present writer, and has since been maintained by Wellhausen (Sibiuæn. U. Vorarbeit, vi. 234), by Ryssel (Apok. und Pseudepig. A. T., 1900, i. 441), and Ginzberg (Jewish Encyclopædia, ii. 555).

Different Elements in the Book and its Dates.—As there are undoubtedly conflicting elements in the book, it is possible to assume either a diversity of authorship or a diversity of sources. The latter view is advocated by Ryssel and Ginzberg, the former by Kabisch, de Faye, R. H. Charles and Beer (Herzog's Real-enc., art. "Pseudographes der Alten Testament," p. 290). A short summary may now be given of the grounds on which the present writer has postulated a diversity of authorship. If the letter to the tribes, p. xxv., be disregarded, the book falls into seven sections separated by large inserted passages (as after xxxv. where the text is probably defective. These sections, which are of unequal length, are (i) i.-v. 6; (ii) vii.-viii.; (iii) ix.-xii. 4; (iv) xii. 5-xx; (v) xxi.-xxxv.; (vi) xxxvi.-xxxvii.; (vii) xlviii.-lxxvii. These treat of the Messiah and the Messianic kingdom, the woes of Israel in the past and the destruction of Jerusalem in the present, as well as of theological questions relating to original sin, free will, works, the number of the saved, the nature of the resurrection body, &c. The views expressed on several of the above subjects are often conflicting. In one class of passages there is everywhere manifest a vigorous optimism as to Israel's ultimate well-being on earth, and the blessedness of the chosen people in the Messianic kingdom is sketched in glowing and sensuous colours (xxix., xxxi-xl., lxxii.-lxxiv.). Over against these passages stand others of a hopelessly pessimistic character, wherein, alike as to Israel's

1. In iii. 28 we have the word ἄμαρτωλός with the extraordinary meaning of "plague" as in Jer. xxxvi. (xxxvi.) 36.

2. Ryssel has adopted Charles's restoration of the text in these passages and practically also in xlviii. 12, but without acknowledgment.
present and future destiny on earth, there is written nothing save 'lamentation, and mourning, and woe.' The world is a scene of corruption, its evils are irreparable, its end is nigh, and the advent of the new and spiritual world at hand. The first to draw attention to the composite elements in this book was Kabisch (Jahrbiicher f. protest. Theol., 1801, pp. 66-107). This critic regarded xxiv. 3-xxix., xxxvi.-xl, and liii.-lxxiv. as independent sources written before the fall of Jerusalem, A.D. 70, and his groundwork, which consists of the rest of his book, with the exception of a few verses, as composed after that date. All these elements were put together by a Christian contemporary of Papias. Many of these conclusions were arrived at independently by a French scholar, De Faye (Les Apocalypses juives, 1892, pp. 25-28, 76-103, 192-204). The present writer (Apocalypse of Baruch, 1896, pp. liii.-lxxv.) after submitting to the book a fresh study, has come to the following conclusions:—

The book is of Pharisaic authorship and composed of six independent writings—A, A', A", B, B', B". The first three were composed when Jerusalem was still standing and the Messiah and the Messianic kingdom were expected: A', a mutilated apocalypse =xxvii.-xxx.x. r. A", the Cedar and Vine Vision =xxxvi.-xl.; A", the latter after A' was written after A.D. 70, and probably before 90. Thus B"=lxxiv. was written by a Jew in exile, who, despairing of a national restoration, looked only for a spiritual recompense in heaven. The rest of the book is divided from B" and B', written in Palestine after A.D. 70. These writings belong to very different types of thought. In B" the earthly Jerusalem is to be rebuilt, but not so in B'; in the former the exiles are to be restored, but not in the latter; in the former a Messianic kingdom without a Messiah is expected, and no earthly blessedness of any kind in the latter, &c. B"=i.-ix. 1, xxi. 2-4, xliii.-xliv. 7, xlvi.-xlvii., lxxvi.-lxxvii., lxxxiv., lxxvi.-lxxvii. B"=ix.-xxv., xxx. 2-xxxv., xlii.-xliii., xxv. 8-15, xlvi.-lili., lxxv.-lxxvi., lxxiii.

The above critical analyses were attacked and rejected by Clemen (Stud. und Krit., 1898, 211 sqq.). He fails, however, in many cases to recognize the difficulties at issue, and those which cannot be ignored he sets down to the conflicting apocalyptic traditions, on which the author was obliged to draw for his subject matter. Resse, (Kautzsch, Apoc. B. R. P. T. T. ii. 490) has followed Clemen, and has given no real explanation of the disorder of the book as it stands at present. Beer (op. cit.) agrees that xxxvi.-xl. and liii.-lxx. are of different authorship from the rest of the book and belong to the earlier date.

Relation to 4 Ezra.—The affinities of this book and 4 Ezra are so numerous (see Charles, op. cit. 170-171) that Ewald and Ryle assumed identity of authorship. But their points of divergence are so weighty (see op. cit. pp. lixix.-lxxi.) that this view cannot be sustained. Three courses still remain open. If we assume that both works are composite, we shall perform at once that some of the constituents of 4 Ezra are older than the latest of Baruch, and that other constituents of Baruch are decidedly older than the remaining ones of 4 Ezra. On the other hand, if we assume unity of authorship, it seems impossible to arrive at finality on the chronological relations of these two works. Langen, Hilgenfeld, Wieseler, Stähelin, Renan, Hausrath, Drummond, Dillmann, Rosenthal, Gunkel, have maintained on various grounds the priority of 4 Ezra; and Schürer, Bissell, Thomson, Deane, Kabisch, De Faye, Wellhausen, and Ryssel the priority of Baruch on grounds no less convincing.

Relation to Rabbinical Literature.—A very close relation subsists between our book and rabbinical literature. Indeed in some instances the parallels are so close that they are almost word for word. The description of the destruction of Jerusalem by angels in vi.-viii. is found also in the Pesikta Rabbati 26 (ed. Friedmann 131a). By means of this passage we are, as Ginsberg has shown, able to correct the corrupt reading "the holy Ephod" (vi. 7), וְשֵׁם הָאָדָם "the holy Ark," i.e. וְשֵׁם יָם. What might be taken as poetic fancies in our text are recounted as historical facts in rabbinical literature. Thus the words (x. 18):

"And ye priests, take ye the keys of the sanctuary, And cast them into the height of heaven, And give them to the Lord and say: 'Guard Thine own house; for lo we are found unfaithful stewards,'"

are given in various accounts of the fall of Jerusalem. (See T'anith, 20a; Pesik. R., loc. cit.; Yalqut Shim'on; iI. xx.; Abbot of Rabbi Nathan vii.). Even the statement that the bodies of Sennacherib's soldiers were burned while their garments and armour remained unconsumed has its parallel in Sanh. 94a.

Integrity of the Book.—In lxxvii. 19 it is said that Baruch wrote two epistles, one to the nine and a half tribes and the other to the two and a half at Babylon. The former is found in lxxvii.-lxxxvi.; the latter is lost, but is probably preserved either wholly or in part in the Book of Baruch, iii. 5-iv. 29 (see Charles, op. cit.); pp. lixiv.-lxxvii. On the other hand, it is not necessary to infer from lxxv. that an account of Baruch's assumption was to be looked for in the book.

Authorities.—The literature is fully cited in Schürer, Gesch. iii. 223-232, and R. H. Charles, Apocalypse of Baruch, pp. xxx.-xliii. Ginsberg's article in the Jewish Encyclopedia, ii. 551-556, is a fresh and valuable contribution.

Rest of the Words of Baruch.—This book was undoubtedly written originally by a Jew but was subsequently revised by a Christian, as has been shown by Kohler in the Jewish Quarterly Review (1893). It passed under a double name in the Abyssinian Church, where it was known both as "the Rest of the Words of Baruch" and "the Rest of the Words of Jeremiah." Its Greek name is the latter—τὰ παραλεγένεστα Ἴηρωον προφήτων. It has been preserved in Greek, Ethiopic, Armenian and Slavonic. The Greek was first printed at Venice in 1609, next by Ceriani in 1868 in his Mon. Sacra, v. 11-18; by Harris, The Rest of the Words of Baruch, in 1889; and Bassiliev, Anot. Graeco-BYZANTINA, i. 308 sqq. (1893). The book begins like the Syriac Apocalypse of Baruch with an account of the removal of the sacred vessels of the Temple before its capture by the Chaldees. Baruch remains in Jerusalem and Jeremiah accompanies the Exiles to Babylon. After 66 years' exile Jeremiah brings back the Jews to Jerusalem, but refuses to admit such as had brought with them heathen wives. Then follows a vision of Jeremiah which is Christian.

Harris regards the book in its present form as an eirenicon addressed to the Jews by a Christian after the rebellion of Bar (Bar Chabab) and written about 136. Though the original work was dependent on the Apocalypse of Baruch it cannot have been written much before the close of the first cent. A.D. Its terminus ad quem is at present indeterminable.

(R. H. C.)

BARUGO, a town on the north coast of the province of Leyte, island of Leyte, Philippine Islands, on Carigara Bay. Pop. (1903) 12,360. It exports large quantities of hemp and copra, and imports rice, petroleum, and cotton-goods.

BARWANI, a native state of India, in the Bhopawar agency in central India. It lies in the Satura mountains, south of the Nerudder. Area, 1178 sq. m.; pop. (1901) 76,136. Many of the inhabitants are Bhils. The chief, whose title is Rana, is a Rajput of the Sidohia clan, connected with the Udaipur family.

Though the family lost most of its possessions during the Mahratta invasion in the 14th century, it never became tributary to any Malwa chief. The forests are under an English official. The town of Barwani is situated near the left bank of the Nerudder. The population in 1901 was 6277.

BATYATSKY, ALEXANDER IVANOVICH, PRINCE (1814-1879), Russian soldier and statesman, was born at Batschkau, the seat of the enoship of the Grand in his seventeenth year and, on the 8th of November 1833, received his commission of cornet in the Life Guards of the cossarевич Alexander. In 1835 he served with great gallantry in the Caucasus, and on his return to St Petersburg was rewarded with a gold sword "for valour." On the first of January 1836 he was attached to the suite of Alexander, and in 1845 was again ordered off to the Caucasus and again most brilliantly distinguished himself, especially in the attack on Shamyl's stronghold, for which he received the order of St George. In 1846 he assisted...
Field Marshal Paskievich to suppress the Cracow rising. From 1848 to 1856 he took a leading part in all the chief military events in the Caucasus, his most notable exploits being his victory at Mezeninsk in 1850 and his operations against Shamyl at Chechen. His energetic and at the same time systematical tactics inaugurated a new era of mountain warfare. On the 6th of January 1853 he was appointed adjutant-general and, on July 5th of the same year, chief of the staff. In 1854 he took part in the brilliant Kürük Dere campaign. On the 1st of January 1856 he became commander-in-chief of the Caucasian army, and, subsequently, governor of the Caucasus. As an administrator he showed himself fully worthy of his high reputation. Within three years of his appointment, the whole of the eastern Caucasus was subdued and the long elusive Shamyl was taken captive.

Baryatinsky also conquered many of the tribes of the western Caucasus dwelling between the rivers Laba and Byelaya. For these fresh services he was created a field marshal. But his health was now entirely broken by his strenuous labours, and on the 6th of December 1856 he was, at his own request, relieved of his post. He spent the last days of his life abroad and died at Geneva, after forty-eight years of active service.

BARYE, ANTOINE LOUIS (1796-1875), French sculptor, was born in Paris on the 24th of September 1796. Like many of the sculptors of the Renaissance he began life as a goldsmith. After studying under Bosio, the sculptor, and Gros, the painter, he was in 1818 admitted to l’École des Beaux Arts. But it was not till 1823, when he was working for Fauconnier, the goldsmith, that he discovered his real bent from watching the wild beasts in the Jardin des Plantes, making vigorous studies of them in pencil drawings worthy of Delacroix and then modelling them in sculpture on a large or small scale. In 1831 he exhibited his “Tiger devouring a Crocodile,” and in 1832 had mastered a style of his own in the “Lion and Snake.” Thenceforward Barye, though engaged in a perpetual struggle with want, exhibited year after year these studies of animals—admirable groups which reveal him as inspired by a spirit of true romance and a feeling for the beauty of the antique, as in “Theseus and the Minotaur” (1847), “Lapitha and Centaur” (1848), and numerous minor works now very highly valued. Barye was no less successful in sculpture on a small scale, and excelled in representing animals in their most familiar attitudes. As examples of his larger work we may mention the Lion of the Column of July, of which the plaster model was cast in 1839, various lions and tigers in the gardens of the Tuileries, and the four groups—War, Peace, Strength, and Order (1854). In 1852 he cast his bronze “Jaguar devouring a Hare.” The fame he deserved came too late to the sculptor. He was made professor at the museum in 1854, and was elected to the Academy of Fine Arts in 1868. He died on the 29th of June 1875. The mass of admirable work left to us by Barye entitles him to be regarded as the great artist of animal life of the French school, and as the creator of a new class of art which has attracted such men as Frémiet, Peter, Cain, and Gardet, who are regarded with justice as his worthiest followers.

BARYE, a widely distributed mineral composed of barium sulphate (BaSO4). Its most striking feature and the one from which it derives its name, baryte, (from the Greek Barys, heavy) or heavy spar, is its weight. Its specific gravity of 4.5 is about twice as great as that of salt and of many other colourless, transparent and glassy minerals not unlike barytes in general appearance. The mineral is usually found in a state of considerable chemical purity, though small amounts of strontium and calcium sulphates may isomorphously replace the barium sulphate: ammonium sulphate is also sometimes present, whilst more complex crystal. Twinning is represented only by twin-lamellae, which are parallel to the planes m and f and are of secondary origin, having been produced by pressure.

Crystals of barytes are orthorhombic and isomorphous with the strontium and lead sulphates (celestite and angleseite); they are usually very perfectly developed and present great variety of form. The simplest are rhombohedral tables (fig. 1) bounded by the two faces of the basal pinacoid (c) and the four faces of the prism (m); the angle between the prism-faces (mm) is 78° 23′, whilst that between c and m is 90°. The mineral has a very perfect cleavage parallel to the faces c and m, and the cleavage surfaces are perfectly smooth and bright. The crystals of prismatic habit represented in figs. 2 and 3 are bounded by the domes d and f and the basal pinacoid c; fig. 4 is a plan of a still clay, silica, bituminous matter, &c., may be enclosed as impurities.

Crystals of barytes are orthorhombic and isomorphous with the strontium and lead sulphates (celestite and angleseite); they are usually very perfectly developed and present great variety of form. The simplest are rhombohedral tables (fig. 1) bounded by the two faces of the basal pinacoid (c) and the four faces of the prism (m); the angle between the prism-faces (mm) is 78° 23′, whilst that between c and m is 90°. The mineral has a very perfect cleavage parallel to the faces c and m, and the cleavage surfaces are perfectly smooth and bright. The crystals of prismatic habit represented in figs. 2 and 3 are bounded by the domes d and f and the basal pinacoid c; fig. 4 is a plan of a still

more complex crystal. Twinning is represented only by twin-lamellae, which are parallel to the planes m and f and are of secondary origin, having been produced by pressure.

Crystals of barytes may be transparent and colourless, or white and opalescent, or of a yellow, brown, bluish or greenish colour. Well-developed crystals are extremely common, but the mineral occurs also in a granular, earthy, or stalactitic condition. It is known as cawk in the Derbyshire lead mines. The “crested” or “cock’s comb” barytes occurs as rounded aggregations of thin lamellar crystals.

Barytes is of common occurrence in metalliferous veins, especially those which yield ores of lead and silver; some of the largest and most perfect crystals of colourless barytes were obtained from the lead mines near Dufton in Westmorland. It is found also in beds of iron ore, and the haematite mines of the Cleator Moor district in west Cumberland have yielded many extremely fine crystals, specimens of which may be seen in all mineral collections. In the neighbourhood of Nottingham, and other places in the Midlands, barytes forms a cementing material in the Triassic sandstones; amber-coloured crystals of the same mineral are found in the fuller’s earth at Nutfield in Surrey; and the septarian nodules in London Clay contain crystals of barytes as well as of calcite. Crystals are found as a rarity in the amygdaloidal cavities of igneous rocks.

Artificially prepared crystals of baryte may be obtained by allowing a solution of a soluble barium salt to diffuse slowly into a solution of a soluble sulphate. Barium chloride is present in some natural waters, and when this is the case the interaction of sulphates results in a deposition of baryte, as has occurred in the pipes and water-boxes of the Newcalle-on-Tyne coal mines.

Commercially, barytes is used in the preparation of barium compounds, as a body for certain kinds of paper and cloth, and as a white pigment (“permanent white”). The finely powdered and washed mineral is too crystalline and consequently of insufficient opacity to be used alone as a paint, and is therefore mixed with “white lead,” of which material it is also used as an adulterant.

BARYTOCALCITE, a rare mineral found only at Alston Moor in Cumberland, where it occurs as diverging groups of white transparent crystals lining cavities in the Mountain Limestone.
The crystals belong to the monoclinic system and are usually prismatic or blade-shaped in habit. The hardness is 4, and the sp. gr. 3.65. There are perfect cleavages parallel to the prism faces inclined at an angle of 73° 6', and a less perfect cleavage parallel to the basal plane, the angle between which and the prism faces is 77° 6'; the angles between these three cleavages thus approximate to the angles (74° 55') between the three cleavages of calcite, and there are other points of superficial resemblance between these two minerals. Chemically, barytocalcite is a double salt of barium and calcium carbonates, $\text{BaCaCO}_3$, thus differing from the orthorhombic bromlite (q.v.) which is an isomorphous mixture of the two carbonates.

**Barytone**, or Baritone (Ital. *baritone*, from Gr. *báriovrot*, deep sounding), a musical term for the male voice whose range lies between those of the tenor and of the bass—a high bass rather than a low tenor; also the name of an obsolete stringed instrument like the viola da Gamba, and of the small $b$ or $c$ saxhorn.

**Basalt**, in petrology, one of the oldest rock names, supposed to be derived from an Ethiopian word *basalt*, signifying a stone which yields iron; according to Pliny, the first basalts were obtained in Ethiopia. In current usage the term includes a large variety of types of igneous rock belonging to the basic subdivision, dark in colour weathering to brown, and comparatively rich in magnesia and iron. Some basalts are in large measure glassy (tachylites), and many are very fine-grained and compact; but it is more usual for them to exhibit porphyritic structure, showing larger crystals of olivine, augite or felspar in a finely crystalline groundmass. Olivine and augite are the commonest porphyritic minerals in basalts, the former green or yellowish (and weathering to green or brown serpentine), the latter pitch-black. Porphyritic plagioclase felspars, however, are also very common, and may be one or two inches in length, though usually not exceeding a quarter of an inch; when fresh they are dark grey with smooth lustrous cleavage surfaces; when decomposed they become turbid, and assume grey or greenish shades. Basaltic lavas are frequently pumy or pumiceous, especially near their surfaces; and, in course of time, the steam cavities become filled with secondary minerals such as calcite, chlorite and zeolites. Another characteristic of basalt is the perfection with which many of them show prismatic or columnar jointing, a structure often called "basaltic jointing."

The minerals of basaltic rocks have a fairly uniform character throughout the whole group. In microscopic section the olivine is pale green or colourless, and is very frequently more or less altered to serpentine. The secondary mineral begins to form upon the surfaces and along the cracks of the olivine, gradually producing a mesh-work in the interstices of which small kernels of olivine remain; and when the process is completed the mesh structure persists in the resulting pseudomorph, giving a clear indication as to its history. The augite is mostly brown, often with a purplish tinge, hardly at all dichroic, but frequently showing zonal or hour-glass structure, and various types of twinning. It weathers to chlorite, urarite, calcite, &c. The plagioclase felspar, if fresh, is transparent and appears simple in ordinary light, but when polarized breaks up into a series of bars of different colours owing to its complex twinned structure. Practically all varieties of this mineral from anorthite to albite are known to occur in basalt, but by far the commonest species are bytownite and labradorite. Weathering destroys the simple character of the fresh mineral, producing turbid pseudomorphs containing epidote, calcite, white micas, kaolin, &c. When these minerals occur as phenocrysts their crystalline outlines may be very perfect (though, especially in the olivine, corrosion and partial resorption may give rise to rounded or irregular forms).

In the groundmass, or second generation of crystal, not only are the ingredients smaller, but their crystals are less perfect; yet in many basalts small lath-shaped felspars and minute prisms of augite, densely crowded together, form the matrix. With these there may be a greater or less amount of brown, isotropic glass. Olivine rarely occurs as an ingredient of the groundmass. In the vitreous basalts sometimes very few crystallized minerals are observable; the greater part of the rock is a dark brown glassy material, almost opaque even in the thinnest sections, and generally charged with black grains of magnetite, skeleton crystals of augite or felspar, spherulites, perlitic cracks, or steam vesicles. In other basaltic rocks no glassy material appears, but the whole mass is thoroughly crystallized; rocks of this nature are generally known to British petrologists as dolerites (q.v.). Till recent years it was widely believed by continental geologists that the pre-Tertiary basalts differed so fundamentally from their Tertiary and recent representatives that they were entitled to be regarded as a distinct class. For the older rocks the names anamesite, diabase porphyrite, *diabas-mandel-stein*, or melaphyre were used, and are still favoured by many writers, to indicate varieties and states of more or less altered basalts and dolerites, though no longer held to differ in any essential respects from the better preserved basalts. Still older is the term *trach*, which is derived from a Swedish word meaning "a stair," for in many places superposed sheets of basalt weather with well-marked step-like or terraced features. This designation is still used as a general term for those porphyroclastic rocks by many geologists and travellers (e.g. *traps-dikes*, the "traps" of the Devonian). In the early years of the 19th century a great controversy convulsed the geological world as to the origin of the older basalts or "floetz-traps." Werner, the Saxon mineralogist, and his school held them to be of aqueous origin, the chemical precipitates deposited in primeval seas, but Hutton and a number of French geologists maintained that they were really volcanic rocks emitted by craters now extinct (see GEOLOGY: Historical).

Of the less common minerals of basalt, a few may be mentioned. Black hornblende, dark brown in thin sections, and often corroded, is not uncommon, especially in intrusive basalts. Hypersthene occurs also, usually replacing olivine. Black mica (*biotite*) is not infrequently to be seen. Sapphire, garnet and zircon are rare. Minerals of the felspathoid group occur in a large number of basaltic rocks; nepheline and leucite are the most common, but haüynie is occasionally present. If nepheline entirely replaces felspar, the rock is known as nepheline-basalt; if the replacement is only partial the term nepheline-basanite is used. Similarly there are leucite-basalts and leucite-basanites. The nepheline is in small sized prisms or basaltic rocks usually cannot be detected with the naked eye. Even with the help of the microscope nepheline basalts are not always easy to determine, as the crystals may be exceedingly small and imperfect, and they readily decompose into analcite and zeolites. In some cases only the presence of the anisotropic substance, with weak double refraction and readily attacked by acids (the so-called "nephelinoid"), can be made out. This substance may be imperfectly crystallized nepheline, or a peculiar glass which is rich in soda. Most nepheline basalts are fine grained, very dark coloured rocks, and belong to the Tertiary period. They are fairly common in some parts of Germany and occur also in Tripoli, Asia Minor, Montana, Cape Verde Islands, &c. Leucite-basalts contain small rounded crystals of leucite in place of plagioclase felspar. Rocks of this group are well known in the Eifel, and other volcanic districts in Germany, also in Bohemia, Italy, Java, Montana, Celcbes, &c. The minerals haüynie, noossan, sodalite and melilite tend to occur with some frequency in nepheline and leucite-basalts, though rare in ordinary basalts. Melilite, a lime-alumina-silicate, is characteristic of certain very basic rocks, the melilite-basalts. It is pale yellow or colourless in thin sections, and yields peculiar and characteristic double-blue polarization colours. This rare group of rocks is known to occur in Bohemia, Swabia and South Africa. Perofskite, in small dark brown cubic crystals, is a constant accessory in these rocks. The augite is usually violet coloured, and shows zonal and hour-glass structures. Green augite may occur in the nepheline-basalts, and aegerine (soda-iron-augite) is occasionally found in them.

The distribution of basalts is world-wide; and in some places
they occur in immense masses, and cover great areas. In Washington, Oregon, and Idaho many thousands of square miles are occupied by basaltic-lava flows. In the Sandwich Islands and Iceland they are the prevalent lavas; and the well-known columnar jointed basalts of Skye, Staffa, and Antrim (Giant's Causeway) form a southward extension of the Icelandic volcanic province, with which they are connected by the similar rocks of the Faeroe Islands. In the Deccan in India great basaltic lava fields are known; and Etna and Vesuvius emit basaltic rocks. In older geological periods they were not less common; for example, in the Carboniferous in Scotland. (J. S. F.)

**BASCOM, JOHN** (1827- ), American educationalist and philosophical writer, was born at Genoa, New York, on the 1st of May 1827. He graduated at Williams College in 1849 and at the Andover Theological Seminary in 1855, was professor of rhetoric at Williams College from 1855 to 1874, and was president of the University of Wisconsin and professor of mental and moral philosophy there from 1874 to 1887. In 1887-1891 and in 1901-1903 he was lecturer in sociology, and in 1891-1901 professor of economics in Williams College. He retired in 1903. Among his publications may be mentioned: *Aesthetics* (1862); *Philosophy of Rhetoric* (1865); *Science, Philosophy and Religion* (1871); *Philosophy of English Literature* (1874); *Philosophy of Revelation* (2 vols., 1879); *Religion and Theology* (1891); *Social Theory* (1895); *Evolution and Religion* (1896); *Growth of Nationality in the United States* (1890); and *God and His Goodness* (1901).

**BASE.** (1) (Fr. bas, Late Lat. bassus, low; cf. Gr. βαθός) an adjective meaning low or deep, and so mean, worthless, or wicked. This sense of the word has sometimes affected the next, which is really distinct. (2) (Gr. βάσις, strictly “stepping,” and so a foundation or pedestal) a term for a foundation or starting point, used in various senses; in sports, e.g. hockey and baseball; in geometry, the line or face on which a figure or solid stands; in crystallography, e.g. “basal plane”; in surveying, in the “base line,” an accurately measured distance between the points from which the survey is conducted; in heraldry, in the phrase “in base,” applied to any figure or emblem placed in the lowest part of a shield.

In chemistry the term denotes a substance which combines with an acid to form a salt. In inorganic chemistry, such compounds are almost invariably oxides or hydroxides, and water is eliminated during the combination; but in organic chemistry many compounds exist, especially ammonia derivatives, which directly combine with acids. Chemical bases are consequently antithetical to acids; and an acid is neutralized by a base with the production of a salt. They reverse certain colour reactions of acids, e.g. turn red litmus blue; this is termed an “alkaline reaction.”

In architecture the “base” is the lowest member of a column or shaft. In Egyptian and Greek architecture it is the raised slab in stone or cement on which the primitive timber column was placed, to keep it dry. Afterwards it was always reproduced in Egypt, even although the column, being in stone, no longer required it; a custom probably retained because, being of a much larger circumference than the lower part of the column, it gave increased stability. In Assyrian architecture, where it served to carry wooden posts or columns, it took the form of a large torus moulding with enrichments. In Persian architecture the base was much higher than in any other style, and was elaborately carved. In primitive Greek work the base consisted of the stone plinth as found in Crete and Tiryans, and of three small steps at Mycenaean. In archaic Greek work it has already disappeared in the Doric order, but in the Ionic and Corinthian orders it is more or less richly moulded, the most elaborate examples being those found in the temple of Apollo at Branchidae in Miletia. For the contour of the mouldings see Orders. The Roman orders all have the favourite design known as the Attic base. Romanesque bases were rude but vigorous copies of the old classic base, and were often decorated with projections or spurs (Fr. griffes) at the angles of the square dies, thus connecting them with the square base. In the Early English style, these spurs followed the conventional design of the period, and about the same time the mouldings were deeply sunk and occasionally cut downwards, so that they would have held water if used externally. Later, the base becomes less bold in treatment, but much more complex in its contours, and in the 15th century is given an unusual height with two stages, the lower one constituting a kind of plinth, which is sometimes known as the ground table, or the base course.

**BASE COURT** (Fr. basse cour, i.e. the lower court), is the first open space within the gates of a castle. It was used for exercising cavalry, and keeping live stock during a siege. (See ENCEinte.)

The base of a wall or ground table, in architecture, is the mouldings round a building just above ground; they mostly consist of similar members to those above described and run round the buttresses. The flat band between the plinth and upper mouldings is frequently panelled and carved with shields, as in Henry VII. Chapel at Westminster.

**BASE-BALL** (so-called from the bases and ball used), the national summer sport of the United States, popular also throughout Canada and in Japan. Its origin is obscure. According to some authorities it is derived from the old English game of rounders (q.v.), several variations of which were played in America during the colonial period; according to other authorities it is a developed form of the game of town-ball, which was already a popular game in America in the early 19th century. In New York, in 1839, when it is said, Abner Doubleday (later a general in the U.S. army) devised a scheme for playing it. About the beginning of the 19th century a game generally known as “One Old Cat” became popular with schoolboys in the North Atlantic states; this game was played by three boys, each fielding and batting in turn, a run being scored by the batsman running to a single base and back without being put out. Two Old Cat, Three Old Cat, and Four Old Cat were modifications of this game, having respectively four, six, and eight players. A development of this game bore the name of town-ball, and the Olympic Town-Ball Club of Philadelphia was organized in 1833. Matches between organized base-ball clubs were first played in the neighbourhood of New York, where the Washington Baseball Club was founded in 1845. The first regular code of rules was drawn up in 1845 by the Knickerbocker Baseball Club and used in its matches with the Gotham, Eagle and Empire clubs of New York, and the Excelsior, Putnam and Eckford clubs of Brooklyn. In 1858 the first National Association was organized, and, while its few simple laws were generally similar to the corresponding rules of the present code, the ball was larger and “livelier,” and the pitcher was compelled to deliver it with a full toss, no approach to a throw being allowed. The popularity of the game spread rapidly, resulting in the organization of many famous clubs, such as the Beacon and Lowell of Boston, the Red Stockings of Cincinnati, the Forest City of Cleveland and the Maple Leaf of Guelph, but, owing to the sharp rivalry between the foremost teams, semi-professionalism soon crept in, although in those days a man who played for a financial consideration always had some other means of livelihood, as the income to be derived from playing ball in the summer time was not enough to support him throughout the year. In spite of its popularity, the game acquired certain undesirable adjuncts. The betting and pool selling evils became very serious; and the game was in thorough disrepute. It was not only generally believed that the matches were not played on their merits, but it was known that players themselves were not above selling contests. At that time many of the journals of the day foretold the speedy downfall of the sport. A convention of those interested financially and otherwise in the game, was held in 1867 in Philadelphia, and an effort was made to effect a reformation. That the sport even then was by no means insignificant can be seen from the fact that in that convention some 500 organizations were represented. While the work done at the convention did not accomplish all that was expected, it did produce certain reforms, and the sport grew rapidly thereafter both in the eastern and in the middle western part of the United States. In the next five years the...
interest in the game became so great that it was decided to send a representation of American base-ball players to England; and two clubs, the Bostons, who were the champions that year, and the Athletics, former champions, crossed the Atlantic and played several exhibition games with each other. While successful in exciting some interest, the trip did not succeed in popularizing base-ball in Great Britain. Fifteen years later two other nations of representative American base-ball players made a general tour of Australia and various other countries, completing their trip by a contest in England. This too, however, had little effect, and later attempts to establish base-ball in England have likewise been unsuccessful. But in America the game continued to prosper. The first entirely professional club was the Cincinnati Red Stockings (1868). Two national associations were formed in 1871, one having jurisdiction over professional clubs and the other over amateurs. In 1876 was formed the National League, of eight clubs under the presidency of Nicholas E. Young, which contained the expert ball-players of the country. There were so many people in the United States who wanted to see professional base-ball that this organization proved too small to furnish the desired number of games, and hence in 1882 the American Association was formed. For a time it seemed that there would be room for both organizations; but there was considerable rivalry, and it resulted in a suggestion of an agreement among the baseball organizations that they were able to work together in harmony. They practically controlled professional base-ball for many years, although there were occasional attempts to overthrow their authority, the most notable being the formation in 1890 of a brotherhood of players called the Players' League, organized for the purpose of securing some of the financial benefits accruing to the managers, as well as for the purpose of abolishing black-listing and other supposed abuses. The Players' League proved not sufficiently strong for the task, and fell to pieces. For some years the National League consisted of twelve clubs organized as stock companies, representing cities as far apart as Boston and St. Louis, but in 1900 the number was reduced to eight, namely, Boston, Brooklyn, Chicago, Cincinnati, New York, Pittsburgh, Philadelphia, and St. Louis. Certain aggressive and dissatisfied elements took advantage of this change to organize a second great professional association under the presidency of B. B. Johnson, the "American League," of eight clubs, six of them in cities where the National League was already represented, and four of the clubs under the National League. It is to be noted, however, as also do the many minor leagues, clubs which control the clubs of the different sections of the country, among which are the Eastern League, the American Association, Western League, Southern Association, New England League, Pacific League and the different state leagues. Professional base-ball has not been free from certain objectionable elements, of which the unnecessary and rowdyish fault-finding with the umpires has been the most evident, but the authorities of the different leagues have lately succeeded, by strenuous legislation, in abating these. Of authorities on base-ball, Henry Chadwick (d. 1908) is the best known.

Amateur base-ball, in its organized phase, is played mostly by school and university clubs as well as those of athletic associations. The first college league was formed in 1879 and comprised Harvard, Princeton, Amherst, Brown and Dartmouth, Yale joining a year later. The Eastern College League, with Columbia, Harvard, Princeton and Yale, followed in 1887. This was afterwards dissolved and at present the most important universities of the eastern states are members of no league, although such organizations have been formed in various western and southern states. Amateur base-ball has progressed along the same lines as professional, although the college playing rules formerly differed in certain minor points from those of the professional leagues.

The following is a general description of the field and of the manner in which the game is played, but as the game has become highly complicated, situations may arise in playing in which general statements do not strictly hold. Any smooth, level field about 150 yds. long and 100 yds. broad will serve for a base-ball ground. Upon this field is marked out with white chalk a square, commonly called the diamond, smooth, like a cricket pitch, the sides of which measure 30 yds. each, and the nearest corner of which is distant about 30 yds. from the limit of the field. This corner is marked with a white plate, called the home-base or plate, five-sided in shape, two of the sides being 7 ft. long and that towards the pitcher 12 in. At the other three corners and attached to pegs are white canvas bags 15 in. square filled with some soft material, and called, beginning at the right as one looks towards the field, first-base, second-base and third-base respectively. The lines from home-base to first, and from home to third are indefinitely prolonged and called foul-lines. The game is played by two sides of nine men each, one of these taking its turn at the bat while the other is in the field endeavouring, as provided by certain rules, to put out the side at bat. Each side has nine turns, or innings, at bat, unless the side last at bat does not need its ninth innings in order to win; a tie at the end of the ninth innings makes additional innings necessary. A full game usually takes from 1 1/2 to 2 hrs. to play. Three batsmen are put out in each innings, and the side scoring the greatest number of runs (complete encircling of the bases without being put out) wins. A runner who is not put out but fails to reach home-base does not score a run, but is "left on base." The ball, which is 9-9 1/2 in. in circumference and weighs 5-5 1/2 oz., is made upon a small core of vulcanized rubber and covered with white leather, which may not be intentionally discoloured. The ball must be round, not over 2 1/2 in. in diameter at the thickest part, nor more than 42 in. in length. It is usually made of ash or some other hard wood, and the handle may be wound with twine. Three-cornered spikes are usually worn on the players' shoes. The catcher and first-baseman (v. infra) may wear a glove of any size on one hand; the gloves worn by all other players may not measure more than 14 in. round the palm nor weigh more than 10 oz.

The Players.—The fielding side consists of (a) the pitcher and catcher, called the battery, (b) the first baseman, second-baseman, third-baseman and short-stop, called infielders, and (c) the left-fielder, centre-fielder and right-fielder, called outfielders. The pitcher, who delivers the ball to the batsmen, is the most important member of the side. In the act of pitching, which is usually done underhand, the hand must open the fingers. or palm, and not clenched, to deliver the ball without throwing it in a slanted manner. Before 1875 the pitcher was obliged to deliver the ball with a full toss only, but about that time a disguised underneath throw, which greatly increased the pace, began to be used so generally that it was soon legalized, and the overhand throw followed as a matter of course. As long as the arm was held stiff no curve could be imparted to the flight of the ball in the air, but with the increase of pace came the possibility of doing this by a movement of the wrist as the ball left the hand, the twist thus given causing the ball, by the pressure on the air, to swerve to one side or the other, or downwards, according to the position of the hand and fingers as the ball is let go. The commotions of these swerving deliveries, and the first one invented, is the out-curve, the ball coming straight towards the batsman until almost within reach of his bat, when it suddenly swerves away from him towards the right, if he be right-handed. The other important curves are the in-curve, shooting sharply to the left, and the drop, with their many variations, nearly every pitcher using some favourite curve. The throwing of balls that are so hard to strike is an important part of pitching strategy, as well as variation of the delivery and the play upon the known weaknesses or idiosyncrasies of the batsman. Good control over the ball is a necessity, as four "balls" called by the umpire,—that is, balls not over the base, or over the base and not between the shoulder and knee of the batsman,—entitle the batsman to become a base-runner and take his first base. If the pitcher disregards the restrictions placed upon him by the rules (e.g. he may not, while in position, make a motion to deliver the ball to the batsman without actually
delivering it, or to first-base, while that base is occupied by a runner, without completing the throw), he is said to have made a balk, which permits a base runner to advance a base. In fielding batted balls the pitcher takes all that come directly to him, especially slow ones which the other fielders cannot reach in time. One of his duties is to “back up” the first-baseman in order to stop balls thrown wide, and to cover first-base in place of the baseman whenever that player has to leave his base to field a ground ball. On occasion he also backs up other positions.

The catcher usually stands about 1 yd. behind the home plate, and he must never be more than 10 ft. behind the home plate when the pitcher delivers the ball to the batsman. He generally catches the ball from the pitcher before it strikes the ground, and, when a man of the opposing side has succeeded in getting to a base, must be on the alert to head this opponent off should he endeavour to steal the next base, i.e. to run it while the pitcher is delivering the ball to the batsman. For this reason the catcher must be a quick, strong and accurate thrower. As the catcher alone faces the whole field, he is able to warn the pitcher when to throw to a base in order to catch a runner napping off the base, and by secretly signalling to the pitcher (usually by means of signs with his fingers) he directs what kind of a ball is to be pitched, so that he may be in the proper position to receive the ball, be it high or low, to left or right. Some pitchers, however, prefer to reserve their choice of balls and therefore do the signalling themselves. The catcher wears a mask, a breast-pad, and a large glove, without which the position would be a very dangerous one.

As every batsman upon hitting the ball must run for the first-base, the first-baseman must be a sure catch of balls thrown to head runners off, even those thrown too low, high or wide. A tall man is usually chosen for this position. The second-baseman usually stands about 30 ft. to the right of second-base and back of the line between the bases, and attends to balls batted to his side of the diamond. He also backs up any exposed position and must be ready to cover second-base whenever a runner tries to steal down from first-base, or whenever there is a runner on second-base, a duty which he shares with the short-stop, whose position corresponds to that of the second-baseman on the left side of the diamond. Short-stop must be a quick and accurate thrower and a lively fielder, as he is required to back up second-and third-base. Both he and the second-baseman must field ground balls cleanly and are often called upon to catch fly balls also. The requirements of third-baseman are very similar, but he must be an exceptionally good thrower, as he has the longest distance to throw to the first-base; and as he plays nearer to the batsman than do the second-baseman and the short-stop, the balls batted in his direction are apt to be faster and more difficult to field. One of the third-baseman's chief duties is to be ready to run in towards the batsman to field "bunts," i.e. balls blocked by allowing them to rebound from a loosely held bat. These commonly roll slowly in the direction of third-baseman, who, in order to get them to first-base in time to put the runner out, must run in, pick them up, usually with one hand, so as to be in position to throw without the loss of an instant, and "snap" them to the first-baseman, i.e. throw them underhand without taking time to raise his body to an erect position. Many of these bunts can be fielded either by the pitcher or, if they drop dead in front of the home-plate, by the catcher. The positions of the three outfielders can be seen on the diagram. Their duties consist of catching all "flies" batted over the heads of the infielders (i.e. high batted balls that have not touched the ground), stopping and returning ground balls that pass the infield, and backing up the basemen. The accompanying diagram indicates the territory roughly allotted to the different fielders. "Back ing up" is a very prominent feature in fielding. Even the pitcher, for example, should run behind the first-baseman when the ball is thrown to the latter by another, in order to stop a widely thrown or missed ball, which, if allowed to pass, would enable the runner to gain one or more additional bases. Bases vacated by their basemen while fielding balls must often, also, be promptly covered by another player. The general rule of defence strategy is similar to that in cricket, namely, to have as many men as possible at the probable point of attack. There is usually an infield and an outfield captain for the special purpose of calling the name of the player who is to take a certain fly ball, to prevent collisions.

The batsman stands three-quarters facing the pitcher within a parallelogram ("box") 6 ft. long and 4 ft. wide, the lines of which he may not overstep, on penalty of being declared out. His object is to get to first-base without being put out. He may do this in several ways. (1) He may make a "safe-hit," i.e. one that is "fair" but cannot be caught, or fielded in time to put him out. (2) He is entitled to first-base if the pitcher pitches four bad balls, at none of which (the batsman) has struck. (3) He may be unavoidably struck by a pitched ball, in which case he is given his base. (4) He may, except in certain specified cases, after a third strike, if the catcher has failed to catch the third one, earn his base if he can reach it before the catcher can throw the ball to the first-baseman, and the first-baseman, with the ball in his possession, touch first-base. (5) He may reach his base by an error of some fielder, which may be either a muffed fly, a failure to stop and field a ground ball, a muffed thrown ball or a bad throw. Only balls batted within the foul-lines (see diagram) are fair. All others are "fouls," and the batsman cannot run on them. All foul-struck balls are called strikes until two strikes have been called by the umpire, after which fouls are not counted.

Batting, as in cricket, is a science by itself, although comparatively more stress is laid on fielding than in cricket. A good batsman can place the ball in any part of the field he chooses by meeting the ball at different angles. He may make a safe hit either by hitting the ball on the ground directly through the infield or out of reach of the fielders, or so hard that it cannot be
stopped. In the last case a failure to stop and field it does not count as an “error” (misplay) for the fielder, even though it came straight at him, the decision as to errors appearing in the score (v. infra) depending upon the official scorer of the home club. The batsman may also hit safely by placing the ball over the heads of the infielders, but not far enough to be caught by the outfielders, or over the heads of the outfielders themselves, or he may bat successfully. A hit by which two bases can be made (without errors by opponents) is a “two-base-hit,” one for three bases a “three-base-hit,” and one for four bases a “home-run.” The batsman may be put out in various ways. For example, he is out (1) if he fails to bat in the order named in the published batting-list; (2) if he fails to take his position within one minute after the umpire has summoned him; (3) if he makes a foul hit which is caught before it strikes the ground (a ball barely touched by the bat ("foul-tip") does not count; (4) if he oversteps the batting-lines; (5) if he intentionally obstructs or interferes with the catcher; (6) if he unsuccessfully attempts the third strike and the ball hits his person or is caught by the catcher (under certain conditions he is out whether the ball is so caught or not), or, not caught, he is out if he runs to first-base and held there by an opposing player before the batsman can get there; (7) if he is forced out at first-base before the catcher becomes a base-runner the moment he starts for first-base. He may, when he first reaches first-base, overrun his base (provided he turns to his right in returning to it) without risk of being put out, but thereafter can be put out by being touched with the ball in the hands of a fielder unless some part of the runner’s person is in contact with the base. When a fair or foul ball struck by a batsman on his side is caught on the fly, he must retouch his base, or be put out if the baseman receives the ball before he can do so. A runner on first-base is forced to run to second as soon as a fair ball is batted, or, being on second with another runner on first, he is forced to run to third. This is called being “forced off his base.” In such a situation the forced runner can be put out if the ball is thrown to the baseman at the next base before the runner gets there. He does not require to be touched with the ball. The runner on first is entitled, however, to advance to second without risk of being put out if the batsman becomes similarly entitled to first-base (e.g. on being unavoidably struck by the ball, or on four balls). Frequently, if the ball is batted to the infield while a runner is on first-base, the fielder tosses it to second baseman, putting out the runner, and the second baseman has still time to throw the ball to first-base ahead of the batsman, thus completing a “double play.” Triple plays are sometimes made when there are runners on two or on all of the bases. Base-running is one of the important arts of base-ball play. A good base-runner takes as long a lead off the base as he dares, starts to run the moment the pitcher makes the first movement to deliver the ball, and if necessary throws himself with a slide, either feet or head first, on to the objective base, the reason for the slide being to make it more difficult for the baseman to touch the runner, having to stoop in order to do so, thus losing time. A base-runner running with an outstretched arm while the latter is fielding a ball or if he is hit by a batted ball. An example of modern base-running is offered by the “double steal,” carried out, e.g., when there is a runner on first-base and a runner on third-base. The runner on first starts for second leisurely in order to draw a throw to second by the catcher. If the catcher throws, the runner on third runs for the home-plate, the second baseman returning the ball to the catcher in order to put the runner out. The play often results in a score, but the runner is frequently caught if the throws are quick and accurate, or when the catcher deceives the runner by throwing, not to the player at second-base, but to a man stationed for the purpose much nearer the home-plate, this man intercepting the ball and returning it to the catcher if the runner on third is attempting to score, or letting it pass to the player on second-base, if the runner on third does not make the attempt.

Team batting is the co-operation of baseman and base-runner. The commonest example is the “hit and run” play, e.g. when a runner is on first-base. After the runner has ascertained by a false start which infielder, whether second-baseman or short-stop, will cover second-base, the batsman signals to the runner that he will hit the next ball. As soon as the pitcher delivers the ball the runner starts for second and the batsman hits the ball to that part of the infield vacated by the fielder who has gone to receive the ball at second from the catcher. If successful this play results in a safe hit, while the runner not infrequently makes, not only second, but third-base as well. Another instance of team batting is when a runner is on third-base and the batsman signals that he will hit the next ball. This enables the runner to get a long start, making his scoring nearly certain if the batsman succeeds in hitting the ball fairly. If the ball is hit without the signal and consequent long start by the runner, the latter is frequently put out at the plate, as the fielder who fields the ball will ignore the batsman and throw the ball to the catcher to head off the runner and prevent a run being scored. In close games the “sacrifice-hit,” a part of team batting, is an important element. It consists, when a runner is on base, of a hit by the batsman resulting in his own retirement but the advancement to the next base of the runner. The sacrifice-hit is most frequently a bunt, as this gives the batsman the best chance of reaching first-base safely, besides surely advancing the runner. Another kind of sacrifice-hit is a long fly to the outfield. On such a hit a runner on third-base (as on the other bases) must remain on the base until after the ball is caught, but the distance from the outfield to the home-plate is so great that a fast runner can generally beat the ball and score his run. When men are on bases, coaches are allowed to stand near first and third bases to direct the runners.

One umpire, who has absolute jurisdiction over all points of play, usually officiates in base-ball, but, in important games, two umpires are often employed, one of them standing behind the catcher and calling the good and bad balls pitched, and the other, posted in the infield, giving decisions on plays at the bases.

In cases where the game is tied after nine innings, extra ones are played, the umpire “calling” a game when it becomes too dark to play. In case of rain, play is suspended by the umpire, who calls the game if the rain continues for one half-hour. Should play be permanently interrupted the game counts if five innings have been completed by each side.

**Scoring.**—The base-ball score shows, in vertical columns, (1) how many times each player has been at bat (bases taken on balls and sacrifice-hits not counted); (2) how many runs he has scored; (3) how many base-hits he has made; (4) how many sacrifice-hits he has made; (5) how many opponents he has put out; (6) how many “assists,” i.e. times he has assisted in putting out (e.g. stopping a ground ball and throwing it to first-base); (7) the number of errors he has made, wild pitches and “passed balls,” i.e. not held by the catcher, as well as balks and bases on balls, not being counted as errors but set down under the regular columns, together with the record of stolen bases, extra long hits, double and triple plays, batsmen struck out by each pitcher, the number of men struck by each pitcher with the ball, the time of the game and the number of the inning.

Careful record is kept of the batting, fielding, pitching and base-running averages of both professional and amateur players. To find the batting record of a player, divide the number of hits made by the number of times at bat. To find a fielding record, divide the number of accepted chances by the total chances, e.g. A.B. put 1188 men out, and assisted sixty-four times, while making fifteen errors; his fielding average is therefore 1252 divided by 1267, or 988, 1000 being perfect fielding.

**BASEDOW, JOHANN BERNHARD** (1723-1790), German educational reformer, was born at Hamburg on the 11th of September 1723, the son of a hairdresser. He was educated at the Johanneum in that town, where he came under the influence of the rationalist H. S. Reimarus (1694-1768), author of the...
famous *Wolfenbütteler Fragmente*, published by Lessing. In 1744 he went to Leipzig as a student of theology, but gave himself up entirely to the study of philosophy. This at first induced sceptical notions; a more profound examination of the sacred writings, and of all that relates to them, brought him back to the Christian faith, but, in his retirement, he formed his belief after his own ideas, and it was far from orthodox. He returned to Hamburg, and between 1749 and 1753 was private tutor in a nobleman's family in Holstein. Basedow now began to exhibit his really remarkable powers as an educator of the young, and acquired so much distinction that, in 1753, he was chosen professor of moral philosophy and belles-lettres in the academy of Söör in Denmark. On account of his theological opinions he was in 1761 removed from this post and transferred to Altona, where some of his published works brought him into great disfavour with the orthodox clergy. He was forbidden to give further instruction, but did not lose his salary; and, towards the end of 1767, he abandoned theology to devote himself with the same ardour to education, of which he conceived the project of a general reform in Germany. In 1768 appeared his Vorstellung an Menschenaufsicht, nebst dem Plan eines Elementarbuches der menschlichen Erkenntnisse, which was strongly influenced by Rousseau's *Emile*. He proposed the reform of schools and of the common methods of instruction, and endeavoured to introduce an idea of moderate equality by soliciting subscriptions for the printing of his *Elementarwerk*, where his principles were to be explained at length, and illustrated by plates. The subscriptions for this object amounted to 15,000 Talers (£1250), and in 1774 he was able to publish the work in four volumes. It contains a complete system of primary education, intended to develop the intelligence of the pupils and to bring them, so far as possible, into contact with realities, not with mere words. The work was received with great favour, and Basedow obtained means to establish an institute for education at Dessau, and to apply his principles in training disciples, who might spread them over all Germany. The name of *Philanthropin* which he gave to the institution appeared to him the most expressive of his views; and he engaged in the new project with all his accustomed ardour. But he had few scholars, and the success by no means answered his hopes. Nevertheless, so well had his ideas been received that similar institutions sprang up all over the land, and the most prominent writers and thinkers openly advocated the plan. Basedow, unfortunately, was little calculated by nature or habits for success, and an employer of unmediated sincerity, science and attention; his temper was intractable, and his management was one long quarrel with his colleagues. He resigned his directorship of the institution in 1778, and it was finally closed in 1793. Basedow died at Magdeburg on the 25th of July 1790.

**BASE FEE,** in law, a freehold estate of inheritance which is limited or qualified by the existence of certain conditions. In modern property law the commonest example of a base fee is an estate created by a tenant in tail, not in possession, who bars the entail without the consent of the protector of the settlement. Though he bars his own issue, he cannot bar any remainder or reversion in the estate (i.e., the base fee) which is created determinable on the failure of his issue in tail. An example of this kind of estate was introduced by George Elliot into the plot of *Felix Holt*. Another example of a base fee is an estate descen
dible to heirs general, but terminable on an uncertain event; for example, a grant of land to A and his heirs, tenants of the manor of Dale. The estate terminates whenever the prescribed qualification ceases. An early meaning of base fee was an estate held not by free or military service, but by base service, i.e. at the will of the lord.

**BASEL** (Fr. *Bâle*), one of the most northerly of the Swiss cantons, and the only one (save Schaffhausen) that includes any territory north of the Rhine. It is traversed by the chain of the Jura, and is watered by the Birse and the Ergols, both tributaries (left) of the Rhine. It is traversed by railways from Basel to Olive (25 m.) and to Laufen (144 m.), besides local lines from Basel to Flühlen (8 m.) for the frequented pilgrimage resort of Mariastein, and from Liestal to Waldenburger (8½ m.). From 1803 to 1814 the canton was one of the six "Directorial" cantons of the Confederation. Since 1833 it has been divided into two half cantons, with independent constitutions.

One is that of Basel Stadt or Bâle Ville, including, besides the city of Basel, the three rural districts (all to the north of the Rhine) of Riehen, Bettingen and Klein Hüningen (the latter now united to the city). The total area of this half canton is 1377 sq. m. only, of which 11 sq. m. are classed as "productive," forests occupying 1½ sq. m., but its total population in 1900 was 117,227 (of whom 3066 inhabited the rural districts), mainly German-speaking, and numbering 73,063 Protestants, 37,121 Romanists (including the Old Catholics), and 1897 Jews.

The cantonal constitution dates from 1889. The executive of seven members and the legislature (Grossrat) of 130 members, as well as the one member sent to the Federal Ständerat and the six sent to the Federal Nationalrat, are all elected by a direct popular vote for the term of three years. Since 1875, 1000 citizens can claim a popular vote (fascilitative Referendum) on all bills brought before the legislature, whether as to laws or to the revision of the cantonal constitution.

The other half canton is that of Basel Landschaft or Bâle Campagne, which is divided into four administrative districts and comprises seventy-four communes, its capital being Liestal. Its total area is 165 sq. m., of which all but 5 sq. m. is reckoned "productive" (including 559 sq. m. of forests). In 1900 its total population was 68,497, nearly all German-speaking, while there were 52,763 Protestants, 15,564 Romanists, and 130 Jews.

The cantonal constitution dates from 1892. The executive of 5 members and the legislature or Landrat (one member per 500 inhabitants or fraction over 400), as well as the single member sent to the Federal Ständerat and the three sent to the Federal Nationalrat, are all elected by a direct popular vote for three years. The "obligatory Referendum" obtains in the case of all laws, while 1500 citizens have the right of "initiative" whether as to laws or the revision of the cantonal constitution. Silk ribbon weaving, textile industries and the manufacture of glass are carried on.

(W. A. B. C.)

**BASEL** (Fr. *Bâle*), but Bâle is a wholly erroneous form; Ital. *Basilea*, the capital of the Swiss half canton of Basel Stadt or Bâle Ville. It is now the second most populous (40,915 inhabitants) town (ranking after Zürich) in the Swiss Confederation, while it is reputed to be the richest, the number of resident millionaires (in francs) exceeding that of any other Swiss town. Both facts are largely due to the opening (1882) of the St Gotthard railway, as merchandise collected from every part of north and central Europe is stored in Basel previous to being redistributed by means of that line. Hence the city has an extremely large and flourishing transit trade, despite the rather dingy appearance of its older portions. The city is divided by the Rhine into Gross Basel (south) and Klein Basel (north), the former being by far the larger. There are several bridges over the river, the old wooden bridge having been replaced in 1905 by one built of stone. The central or main railway station is in Gross Basel, while the Baden station is in Klein Basel. The most prominent building in the city is the cathedral or Münster, built of red sandstone, on a terrace high above the Rhine. It was consecrated in 1539, but was mainly rebuilt after the disastrous earthquake of 1356 that nearly ruined the city. The public meetings of the great oecumenical council (1431-1449) were held in the choir, while the committees sat in the chapter-house. Erasmus lived in Basel 1521-1529, and on his death there (1536) was buried in the cathedral, attached to which are cloisters, in which various celebrated men are buried, e.g. Oecolampadius (d. 1531), Grynaeus (d. 1541), Buxtorf (d. 1732). The 16th-century Rathaus or town hall has recently been restored. In the museum is a fine collection of works of art by Holbein (who lived in Basel from
BASEL, CONFESSION OF—BASEL, COUNCIL OF

1528 to 1531, while the historical museum (in the old Franciscan church) contains many treasures, and among them the fragments of the famous Duke of Guise, the palace of which was destroyed in 1697. The university (founded by Pius II. in 1460) is the oldest in Switzerland, and of late years has been extended by the construction of detached buildings for the study of the natural sciences, e.g. the Vesaliurn and the Bernoullianum. The university library is very rich, and contains the original MSS. of the acts of the great eccumenical council. There are a number of modern monuments in the city, the most important being that set up to the memory of the Swiss who fell in the battle of St. Jakob (1444), won by the French. Basel is the seat of the chief missionary society in Switzerland, the training school for missionaries being at St. Chrischona, 6 m. out of the city.

The town was founded in A.D. 374 by the emperor Valentinian, from whose residence there it takes its name. In the 5th century the bishop of Augusta Rauricorum (now called Kaiser August), 74 m. to the east, moved his see thither. Henceforth the history of the city is that of the growing power, spiritual and temporal, of the bishop, who is generally considered as the Rector of the city from 1314 onwards. The city is first mentioned in 1356 in the advance of the communal power of the burgesses. In 1356 the city was nearly destroyed by a great earthquake. After long swayings between the neighboring Rhine cities and the Swiss Confederation, it was admitted into the latter in 1501. It later became one of the chief centres of the Reformation movement in Switzerland, so that the bishop retired in 1525 to Porrentruy, where he resided till 1572, finally settling at Solure in 1828, the bishopric having been wholly reorganized since 1814. In as many Swiss towns the trade guilds got all political power into their hands, especially by the 18th century. They naturally favoured the city at the expense of the rural districts, so that in 1832 the latter proclaimed their independence, and in 1833 were organized into the half canton of Basel Landschaft, the city forming that of Basel Stadt.

BASEL, CONFESSION OF, one of the many statements of faith produced by the Reformation. It was put out in 1534 and must be distinguished from the First and Second Helvetic Confessions, its author being Oswald Myconius, who based it on the decrees of the Council of Constance and the Council of Basel, 1431, and was inscribed in the name of the city of Basel. The council was convoked by the bishops of Basel, often, and was a body of the Eucharist, and the people of Strassburg even reproached those of Basel with celebrating a Christless supper. Up to the year 1826 the Confession (sometimes also known as the Confession of Mühlhausen from its adoption by that town) was publicly read from the pulpits of Basel on the Wednesday of Passion week in each year. In 1872 a resolution of the great council of the city practically annulled it.

BASEL, COUNCIL OF. A decree of the council of Constance (9th of October 1417) sanctioned by Martin V. had obliged the papacy periodically to summon general councils. At the expiry of the first term fixed by this decree, Martin V. did, in fact, call together a council, which it was necessary to transfer almost at once to Siena, owing to an epidemic, and which had to be dissolved owing to circumstances still imperfectly known, just as it was beginning to discuss the subject of reform (1424).

The next council was due to assemble at the expiry of seven years, i.e. in 1431; with his usual punctuality, Martin V. duly convoked it for this date to the town of Basel, and selected to preside over it the cardinal Julian Cesarini, a man of the greatest worth, both intellectually and morally. Martin himself, however, died before the opening of the synod.

From Italy, France and Germany the fathers were slow in appearing at Basel. Cesarini devoted all his energies to the war against the Hussites, until the disaster of Taus forced him hastily to evacuate Bohemia. The progress of heresy, the reported troubles in Germany, the war which had lately broken out between the dukes of Austria and Burgundy, and finally, the small number of fathers who had responded to the summons of Martin V., caused that pontiff's successor, Eugenius IV., to think that the synod of Basel was doomed to certain failure. This opinion, added to the desire which he had of himself presiding over the council, induced him to recall the fathers from Germany, whither his health, impaired by late, probably owing to a cerebral congestion, rendered it all the more difficult for him to go. He commanded the fathers to disperse, and appointed Bologna as their meeting-place in eighteen months' time, his intention being to make the session of the council coincide with some conferences with representatives of the Greek church, which were to be held there with a view to union (18th December 1431).

This order led to an outcry among the fathers of Basel and incurred the deep disapproval of the legate Cesarini. The Hussites, it was said, would think that the Church was afraid to face them; the laity would accuse the clergy of shirking reform; in short, this failure of the councils would produce disastrous effects. In vain did the pope explain his reasons and yield certain points; the fathers would listen to nothing, and, relying on the decrees of the council of Constance, which amid the troubles of the schism had proclaimed the superiority, in certain cases, of the council over the pope, they insisted upon their right of remaining assembled, hastily beat up the laggards, held sessions, took up their decrees, interfered in the papal council, and countship of Venaisin, treated with the Hussites, and, as representatives of the universal Church, presumed to impose laws upon the sovereign pontiff himself. Eugenius IV. resolved to resist this supremacy, though he did not dare openly to repudiate a very widespread doctrine considered by many to be the actual foundation of the authority of the popes before the schism. However, he soon realized the impossibility of treating the fathers of Basel as ordinary rebels, and tried a compromise; but as time went on, the fathers became more and more intractable, and between him and them gradually arose an impassable barrier.

Abandoned by a number of his cardinals, condemned by most of the powers, deprived of his dominions by condottieri who shamelessly invoked the authority of the council, the pope made concession after concession, and ended on the 15th of December 1433 by a pitiable surrender of all the points at issue in a bull, the terms of which were dictated by the fathers of Basel, that is, by declaring his bull of dissolution null and void, and recognizing that the synod had not ceased to be legitimately assembled. It would be wrong, however, to believe that Eugenius IV. ratified all the decrees coming from Basel, or that he made a definite submission to the supremacy of the council. No express pronouncement on this subject could be wrung from him, and his enforced silence concealed the secret design of safeguarding the principle of sovereignty.

The fathers, who were filled with suspicion, would only allow the legates of the pope to preside over them on the condition of their recognizing the superiority of the council; the legates ended by submitting to this humiliating formality, but in their own name only, thus reserving the judgment of the Holy See. Nay more, the difficulties of all kinds against which Eugenius had to contend, the insurrection at Rome, which forced him to escape by the Tiber, lying in the bottom of a boat, left him at first little chance of resisting the enterprises of the council.

Emboldened by their success, the fathers approached the subject of reform, their principal object being to curtail the power and resources of the papacy. This is why, besides the disciplinary
measures which regulated the elections, the celebration of divine services, the periodical holding of diocesan synods and councils, are found also decrees aimed at some of the “rights” by which the popes had extended their power, and helped out their finances at the expense of the local churches. Thus annates (q.v.) were abolished, the abuse of “reservation” of the patronage of benefices by the pope was much limited, and the right claimed by the pope of “next presentation” to benefices not yet vacant (known as gratiae expectatiae) was done away with altogether. By other decrees the jurisdiction of the court of Rome was much limited, and rules were even made for the election of popes and the constitution of the Sacred College. The fathers continued to devote themselves to the subjugation of the Hussites; they also intervened, in rivalry with the pope, in the negotiations between France and England which led only to the treaty of Arras, concluded by Charles VII, with the duke of Burgundy; finally, they investigated and judged numbers of private cases, lawsuits between prelates, members of religious orders and holders of benefices, thus themselves falling into one of the serious abuses for which they had most blanched the court of Rome.

The democratic character of the assembly of Basel was the result both of its composition and of its organization; not only was the ban of assembly of mandates in it always small in number, but that of the doctors, masters, representatives of chapters, monks or clerks of inferior orders, but the influence of the superior clergy had all the less weight because, instead of being separated into “nations,” as at Constance, the fathers divided themselves according to their tastes or aptitudes into four large committees or “deputations” (deputations), one concerned with questions of faith (fidei), another with negotiations for peace (paci), the third with reform (reformatorii), the fourth with what they called “common concerns” (pro communibus). Every decision made by three of these “deputations”—and in each of them the lower clergy formed the majority—was ratified for the sake of form in general congregation, and if necessary led to decrees promulgated in session. It was on this account that the council could sometimes be called, not without exaggeration, “an assembly of copyists” or even “a set of grooms and scullions.”

Eugenius IV., however much he may have wished to keep on good terms with the fathers of Basel, was neither able nor willing to accept or observe all their decrees. The question of the union, with its constitution of the congress, occupied the chief standing between them which soon led to a rupture. The emperor John Palaeologus, pressed hard by the Turks, showed a great desire to unite himself with the Catholics; he consented to come with the principal representatives of the Greek church to some place in the west where the union could be concluded in the presence of the pope and of the Latin council. Hence arose a double negotiation between him and Eugenius IV. on the one hand and the fathers of Basel on the other. The chief object of the latter was to fix the meeting-place at a place remote from the influence of the pope, and they persisted in suggesting Basel or Avignon or Savoy, which neither Eugenius nor the Greeks would on any account accept. The result was that Palaeologus accepted the offers of the pope, who, by a bull dated the 18th of September 1437, again pronounced the dissolution of the council of Basel, and summoned the fathers to Ferrara, where on the 8th of January 1438 he opened a new synod which he later transferred to Florence. In this latter town took place the momentary union, which was more apparent than real, between the Latin and the Greek church (6th July 1439). By this time council of Basel, though abjured by Czarina and most of its members, persisted none the less, under the presidency of Cardinal Aleman, in affirming its oecumenical character. On the 24th of January 1438 it suspended Eugenius IV., and went on in spite of the intervention of most of the powers to pronounce his deposition (25th June 1438), finally giving rise to a new schism by electing on the 4th of November Amadeus VIII., duke of Savoy, as pope, who took the name of Felix V.

This schism lasted fully ten years, although the antipope found hardly any adherents outside of his own hereditary states, those of Alphonso of Aragon, of the Swiss confederation and certain universities. Germany remained neutral; Charles VII. of France confined himself (2) to securing to his kingdom by the Pragmatic Sanction of Bourges, which became law on the 13th of July 1438, the benefit of a great number of the reforms decreed at Basel; England and Italy remained faithful to Eugenius IV. Finally, in 1447 Frederick III., king of the Romans, after negotiations with Eugenius, commanded the burgomaster of Basel not to allow the presence of the council any longer in the imperial city.

In June 1448 the ramp of the council migrated to Lausanne. The antipope, at the instance of France, ended by abdicating (7th April 1449). Eugenius IV. died on the 23rd of February 1447, and the fathers of Lausanne, to save appearances, gave their support to his successor, Nicholas V., who had already been governing the Church for two years. Trustworthy evidence, they said, proved to them that this pontiff accepted the dogma of the superiority of the council as it had been defined at Constance and at Basel. In reality, the struggle which they had carried on in defence of this principle for seventeen years, with a good faith which it is impossible to ignore, ended in a defeat. The papacy, which had been so fundamentally shaken by the great schism of the West, came through this trial victorious. The era of the great councils of the 15th century was closed; the constitution of the church remained monarchical.

The term applied to the lowest storey of any building placed wholly or partly below the level of the ground. It is incorrectly applied to the ground storey of any building, even when, as for instance in the case of Somerset House, London, the ground floor is of plain or rusticated masonry, and the upper storey which it supports is divided up and decorated with columns or pilasters.

BASAH, or BASHAN, a Rajput hill state, within the Punjab, amid the Himalayan mountains, with an area of 3820 sq. m. and a population in 1901 of 85,582. In 1808, the raja being weak in intellect and aged, his heir, the administration was undertaken by a British official. In 1806 there were serious troubles owing to the refusal of the people to pay taxes. The revenue is obtained chiefly from land and forests, the latter being leased to the British government.

BASHAN, a region lying E. of the Jordan, and towards its source. Its boundaries are not very well defined, but it may be said in general to have been north of the territory of Gilead. The name first appears in Hebrew history in connexion with the wanderings of the Israelites. According to Numbers xxx. 33, the tribes after the rout of Sihon, king of the Amorites, turned to go by the land of Bashan; and its king, Og, met them at Edrei, and was there defeated and slain. The value of this narrative is a matter of much dispute. The gigantic stature of the king, and the curious details about his “bedstead” (Deut. iii. 11) are regarded as suggestive of legend; to say nothing of the lateness of all the documents relating to the wars of Og, and the remoteness of Bashan from the regions of the Israelites’ wanderings. The story, however, had so firm a hold on Hebrew tradition that it cannot fail to have some basis in fact; and an invasion by Israel of Bashan before coming to Jordan is by no means an improbability.

The great stature of Og is explained in the passage of Deuteronomy mentioned by the statement that he was of the remnant of the aboriginal Rephanim. This was a race distinguished by lofty stature; and in Genesis xiv. 5 we find them established in Ashteroth-Karnaim (probably the same as Ashkothor, which, as we shall see, was an important city of Bashan). The territory
BASHI-BAZOUK—BASHKALA

was allotted on the partition of the conquered land to the eastern division of the tribe of Manasseh (Numbers xxxii. 33; Josh. xiii. 20). One of the cities of refuge, Golan, was in Bashan (Deut. iv. 43). By Solomon, Bashan, or rather “the region of Argob in Bashan,” containing “threesome great cities with walls and brazen bars,” was assigned to the administrative district of Ben-Geber, one of his lieutenants (1 Kings iv. 13, compare ver. 19). In the days of Jehu the country was taken from Israel by Hazael, king of Syria (2 Kings x. 33). This is the last historical event related in the Old Testament of Bashan. In the poetical and prophetic books it is referred to in connexion with the products for which it was noted. From a passage in the “Blessing of Moses” (Deut. xxxiii. 22) it seems to have been inhabited by lions. Elsewhere it is referred to in connexion with its cattle (Deut. xxxii. 14; Ezek. xxxix. 18), which seem to have been profligate for ferocity (Ps. xlix. 12); Amos (iv. 1) calls the wealthy women of Samaria, who oppressed the poor, “kine of Bashan.” It is also noted for its mountain (Ps. lxxvi. 13), and especially for oaks, which are coupled with the cedars of Lebanon (Isa. ii. 13; compare xxxiii. 9; Zechariah xi. 4).

The boundaries of Bashan may to some extent be deduced from the indications afforded in the earlier historical books. Og dwelt at Ashteroth, and did battle with the Israelites at Edrei (Deut. i. 4). In Deut. iii. 4, “the region of Argob” with its three cities is mentioned; Mt. Hermon is referred to as a northern limit, and Salehah is alluded to in addition to the other cities already mentioned. Josh. xii. 4 and Josh. xiii. 29 confirm this. Josephus (Ant. iv. 5. 3; Wars, ii. 6. 3) enumerates four provinces of Bashan, Gaulanitis, Trachonitis, Auranitis and Batanaea. Gaulanitis (which probably derived its name from the city of refuge, Golan, the site of which has not yet been discovered) is represented by the modern Jaulan, a province extending from the Jordan lakes to the Hj Road. Josephus (Wars, iv. 1. 1) speaks of it as divided into two sections, Gamalitis and Sogana. Trachonitis (mentioned in Luke iii. 1 as in the territory of Philip the tetrarch) adjourned to the territory of Damascus, Auranitis and Batanaea. This corresponds to the Trachones of Strabo (xvi. 20), and the modern district of the Lej; inscriptions have been found in the Lejá giving Trachón as its former name. Auranitis is the Hauran of Ezekiel xvi. 16, and of the modern Arabs. It is south of the Jaulan and north of Gilead. According to Porter (Journal Soc. Lit., 1854, p. 303), the name is locally restricted to the plain south of the Lejá and the narrow strip on the west; although it is loosely applied by strangers to the whole country east of the Jaulan. The fourth province, Batanaea, which still is remembered in the name Ard el-Bathaniyeh, lies east of the Lejá and the Hauran plain, and includes the Jebel el-Druz or Hauran mountain.

The identification of Argob, a region of the kingdom of Og, is a matter of much difficulty. It has been equated on philological grounds to the Lejá. But these arguments have been shown to be shaky if not baseless, and the identification is now generally abandoned. The confidence with which the great cities of Og were identified with the extensive remains of ancient sites in the Lejá and Hauran has also been shown to be without justification. The so-called “giant cities of Bashan” which were mentioned are now known to be Greco-Roman, not earlier than the time of Herod, and, though in themselves of very high architectural and historical interest, have no connexion whatever with the more ancient periods. No tangible traces of Og and his people, or even of their Israelite supplacers, have yet been found.

This fact somewhat weakens the various identifications that have been proposed for the cities of Bashan enumerated by name. Edrei for example is identified with Ed-Dera’. This is perhaps the most satisfactory comparison, for besides the Greco-Roman remains there is an extensive subterranean city of unknown date, which may be of great antiquity, though even this is still sub judice. The other identifications which have commanded acceptance are as follows:—Ashteroth Karnaim, also called Ashtaroth and (Josh. xxi. 27) Be-eshterah, has been identified with Bashar (Bostra), where there are very important Herodian ruins, but there is no tangible evidence yet advanced that the history of this site is of sufficient antiquity. From the similarity of the names, it has also been sought at Tell Askarri and Tell ‘Ashkera. The true site can be determined, if at all; by excavation only; identifications based on mere outward similarity of names have always been fruitful sources of error. Salechah is perhaps less doubtful; it is a remarkable name, and a ruin similarly styled, Saltkah, is to be seen in the Hauran. It is inhabited by Druses. Another town in eastern Manasseh, namely Kenath, has been identified by Porter with Kanawat, which may be correct.

In the later history Bashan became remarkable as a refuge for outlaws and robbers, a character it still retains. The great subterranean “city” at Ed-Dera’a has been partially destroyed by the local sub-governor, in order to prevent it becoming a refuge of fugitives from justice or from government requirements (conscript, taxation, &c.). Strabo refers to a great cave in Trachonitis capable of holding 4000 robbers. Arab tradition regard it as the home of Job; and it is famous as being the centre of the Druze race or Druze dynasty. The Hauran is one of the principal habitations of the sect of the Druses.

The physical characteristics of Bashan are noteworthy. Volcanic origin in—The Jebel el-Druz is a group of extinct volcanoes—the friable volcanic soil is extraordinarily fertile. It is said to yield wheat eighty-fold and barley a hundred. The oaks for which the country was once famous still distinguish it in places.

Porter, Five Years in Syria and Palestine (2 vols., 1855); The Giant Cities of Bashan (out of date, but some of the descriptions good, 1865); J. G. Zeitsch, Reisebericht über Hauran und die Trachonen (Berlin, 1860); Sir R. F. Burton and C. F. T. Drake, Unexplored Syria (1872); G. Schumacher, The Jews (1888); A. H. Sayce, The States of the Later Assyria (1890); Across the Jordan (1896), (Palestine Exploration Fund); Rev. W. Ewing, A Journey in the Hauran (with a large collection of inscriptions); Palestine Exploration Fund Quarterly Statement, 1895; W. H. Waddington, Inscriptions of Syria may also be consulted; Dussud (René) and Frédéric Macler, Voyage archéologique au Safa et dans le Djebel ed-Druz (1901). In 1900 an important survey of the Hauran and neighbouring regions was made under American auspices, directed by Dr. E. L. Thwaites. The publication of the great harvest of results was begun in 1906.

BASHI-BAZOUK, the name given to a species of irregular mounted troops employed by the Turks. They are armed and maintained by the government but do not receive pay. They do not wear uniform or distinctive badges. They fight either mounted or dismounted, chiefly the latter, but are incapable of undertaking serious work, because of their lack of discipline. Their uncertain temper has sometimes made it necessary for the Turkish regular troops to disarm them by force, but they are often useful in the work of reconnaissance and in outpost duty. They are accused, and generally with justice, of robbery and maltreatment of the civil population, resembling in those things, as in their fighting methods and value, the Croats, Pandours and Tolpitches of 18th-century European armies. The term is also used of a mounted force, existing in peace time in various parts of the Turkish empire, which performs the duties of gendarmerie.

BASHKALA, the chief town of a sanjak of the vilayet of Van in Asiatic Turkey. It is a military station, situated at an elevation of 7500 ft. above sea-level in the valley of the Great Zab river. It stands on the east slope of lofty bare mountains, overlooking a wide valley on the further side of which flows the Zab. On a knoll above is a ruined fortress formerly occupied by a Kurdish Bey. The population numbers some 10,000, principally Kurds, but including 1500 Armenians and 1000 Jews. The place is important as the centre of the Hakkari sanjak, a very difficult mountain district to the south-west containing numerous tribes of Kurds and Nestorian Christians, and also the many Kurdish tribes along the Persian frontier. The houses are well built of sun-dried brick, and the streets are wide and fairly clean. Good smiths' and carpenters' work is
done. The bazaar is small, although a thriving trade is done with the mountain districts. Owing to the great elevation the winter is extremely severe, and the summer of short duration. Wheat, barley, millet and sesame are cultivated on the plain, but fruit and vegetables have mostly to be imported from Persia. Roads lead to Van, Urnia in Persia and Mosul through the Nestorian country. The Kurd and Nestorian tribes in the wilder parts of the Hakkiari Mountains are under slight government control, and are permitted to pay tribute and given self-government in a large degree.

BASHKIRS, a people inhabiting the Russian governments of Ufa, Orenburg, Perm and Samara, and parts of Yyatka, especially on the slopes and confines of the Ural, and in the neighbouring plains. They speak a Tatar language, but some authorities think that they are ethnically a Finnish tribe transformed by Tatar influence. The name Bashkir or Bash-kürt appears for the first time in the beginning of the 10th century in the writings of Ibn-Foslan, who, describing his travels among the Volga-Bulgarians, mentions the Bashkirs as a warlike and idolatrous race. The name was not used by the people themselves in the 10th century, but is a mere nickname.

Of European authors, the first to mention the Bashkirs are Joannes de Plano Carpini (c. 1200–1260) and William of Rubruquis (1220–1293). These travellers, who fell in with them in the upper parts of the river Ural, call them Pascatir, and assert that they spoke at that time the same language as the Hungarians. Till the arrival of the Mongols, about the middle of the 13th century, the Bashkirs were a strong and independent people and troublesome to their neighbours, the Bulgarians and Petchenges. At the time of the downfall of the Kazan monarchy they were in a weak state. In 1556 they voluntarily recognized the supremacy of Russia, and, in consequence, the city of Ufa was founded to defend them from the Kirghiz, and they were subjected to a fur-tax. In 1676 they rebelled under a leader named Seit, and were with difficulty reduced; and again in 1707, under Alcar and Kshyom, on account of ill-treatment by the Russian officials. Their third and last insurrection was in 1735, at the time of the foundation of Orenburg, and it lasted for six years. In 1786 they were freed from taxes; and in 1798 an irregular army was formed from among them. They are now divided into cants and villages, and the differences have arisen between them and the government about land questions. By mode of life the Bashkirs are divided into settled and nomadic. The former are engaged in agriculture, cattle-rearing and bee-keeping, and live without want. The nomadic portion is subdivided, according to the districts in which they wander, into those of the mountains and those of the steppes. Almost their sole occupation is the rearing of cattle; and they attend to that in a very negligent manner, not collecting a sufficient store of winter fodder for all their herds, but allowing part of them to perish. The Bashkirs are usually very poor, and in winter live partly on a kind of gruel called yërym, and badly prepared cheese named sëftir. They are hospitable and generous, and at so much to plunder to the last degree lazy. They have large heads, black hair, eyes narrow and flat, small foreheads, ears always sticking out and a swarthy skin. In general, they are strong and muscular, and able to endure all kinds of labour and privation. They profess Mohammedianism, but know little of its doctrines. Their intellectual development is low.

Carpinelli, Liber Tartarorum, edited under the title Relations des Mongols au Tartares, by d’Avezac (Paris, 1836); Guillelmus de Rubruquis, The Journey of William of Rubruck to the Court of the Great Tartar, translated by W. W. Rockhill (London, 1900); Semenoff, Storia Russ. Imp., vol. 1; Fröhlich, “De Bashkiriis,” in Mémo. de l’Acad. de St-Pétersbourg (1822); Florinsky, in Vestnik Evropy (1874); and Katariakinis, Dictionnaire Bashkir-Russe (1900).

BASHKIRSTEFF, MARIA CONSTANTINOVA [MARIE] (1860–1884), Russian artist and writer, was born at Gavrontsi in the government of Pultowa in Russia on the 23rd of November 1860. When Marie was seven years old, as her father (marshal of the nobility at Pultowa) and her mother were unable through incompatibility to live together, Madame Bashkirtseff with her little daughter left Russia to spend the winters at Nice or in Italy, and the summers at German watering-places. Marie was educated under the supervision of a tutor, who gave lessons in Russian, French, and English. She was an enthusiastic and highly precocious student; she passed in 1881 and 1882 the Baccalaureate with four languages with almost equal facility. A gifted musician, she at first hoped to be a singer, and studied seriously in Italy to that end; her voice, however, was not strong enough to stand hard work and failed her. Meanwhile she was also learning to draw. When she lost her voice she devoted herself to painting, and in 1877 settled in Paris, where she worked steadily in Tony Robert-Fleury’s studio. In 1880 she exhibited in the salon a portrait of a woman; in 1881 she exhibited the “Atelier Julian;” in 1882 “Jean et Jacques”; in 1884 the “Meeting,” and a portrait in pastel of a lady—her cousin—now in the Luxembourg gallery, for which she was awarded a mention honorable. Her health, always delicate, could not endure the labour she imposed on herself in addition to the life of fashion in which she became involved as a result of her success as an artist, and she died of consumption on the 3rd of October 1884, leaving a small series of works of remarkable promise.

From her childhood Marie Bashkirtseff kept an autobiographical journal; an annotated edition of these brilliant confessions (Journal de Marie Bashkirtseff, 1890) has been made by a French leader; it is an interesting book by the girl’s precious gifts and by the names of the various distinguished persons with whom she came in contact, so treated certain portions as to draw down vehement protest. This, to some extent, has brought into question the stamp of truthfulness which constitutes the chief merit of this extraordinary interesting book. A further instalment of Marie Bashkirtseff literature was published in the shape of letters between her and Guy de Maupassant, with whom she started a correspondence under a feigned name and without revealing her identity.

See Mathilde Blind, A Study of Marie Bashkirtseff (T. Fisher Unwin, 1902); The Journal of Marie Bashkirtseff: an Exposure and a Defence, by S. (showing that there is throughout a mistake of four years in the dates of the diary); Black and White, 6th Feb. and 11th April 1891, pp. 17, 304; The Journal of Marie Bashkirtseff, translated, with an Introduction, by Mathilde Blind (2 vols., London, 1890); The Letters of Marie Bashkirtseff (1 vol.).

BASIL, known as BASIL THE GREAT (c. 330–379), bishop of Caesarea, a leading churchman in the 4th century, came of a famous family, which gave a number of distinguished supporters to the Church. His eldest sister, Macrina, was celebrated for her saintly life; his second brother was the famous Gregory of Nyssa; his youngest was Peter, bishop of Sebaste; and his eldest brother was the famous Christian jurist Naukratus. There was in the whole family a tendency to ecstatic emotion and enthusiastic piety, and it is worth noting that Cappadocia had already given to the Church men like Firmilian and Gregory Thaumaturge. Basil was a native of Cappadocia. While he was still a child, the family removed to Pontus; but he soon returned to Cappadocia to live with his mother’s relations, and seems to have been brought up by his grandmother Macrina. Eager to learn, he went to Constantinople and spent four or five years there and at Athens, where he had Gregory (q.v.) of Nazianzus for a fellow-student. Both men were deeply influenced by Origen, and compiled the well-known anthology of his writings, known as Philocalia (edited by J. A. Robinson, Cambridge, 1853). It was at Athens that he seriously began to think of religion, and resolved to seek out the most famous hermit saints in Syria and Arabia, in order to learn from them how to attain to that enthusiastic piety in

1 The name Basil also belongs to several other distinguished churchmen. (1) Basil of Ancyra from 336 to 360, a semi-Arian, highly favoured by the emperor Constantine, and a great polemical writer; none of his works are extant. (2) Basil of Seleucia, fl. 440, a bishop who shifted sides continually in the Eutychian controversy, and who wrote extensively; his works were published in Paris in 1622. (3) Basil of Ancyra, fl. 787; he opposed impiety at the second council of Nicaea, but afterwards retracted. (4) Basil of Ancyra, 710; he was a strong opponent of monothelitism about 1155; he was a stanch upholder of the claims of the Eastern Church against the widening supremacy of the papacy.
which he delighted, and how to keep his body under by macera-
tion and other ascetic devices. After this we find him at the
head of a convent near Arnei in Pontus, in which his mother
Emilia, now a widow, his sister Macrina and several ladies,
gave themselves to a pious life of prayer and charitable works.
He was not ordained presbyter until 365, and his ordination was
probably the result of the entreaties of his ecclesiastical superiors,
who wished to use his talents against the Arians, who were
numerous in that part of the country and were favoured by the
Arian emperor Valens, who then reigned in Constantinople.
In 370 Eusebius, bishop of Caesarea, died, and Basil was chosen
to succeed him. It was then that his great powers were called into
action. Caesarea was an important diocese, and its bishop was,
ex officio, exarch of the great diocese of Pontus. Hot-blooded
and somewhat imperious, Basil was also generous and symp-
thetic. "His zeal for orthodoxy did not blind him to what was
good in an opponent; and for the sake of peace and charity
he was content to waive the use of orthodox terminology when
it could be surrendered without a sacrifice of truth." He died
in 379.

The principal theological writings of Basil are his De Spiritu Sancto, a lucid and edifying appeal to Scripture and early Chris-
tian tradition, and his three books against Eunomius, the chief
exponent of Anomoeanarianism. He was a famous preacher,
and many of his homilies, including a series of ten lenten lectures on
the Hexaëmeron, and an exposition of the psalter, have been
preserved. His ascetic tendencies are exhibited in the Moralia
and Regularæ, ethical manuals for use in the world and the
Cloister respectively. His three hundred letters reveal a rich
and observant nature, which, despite the troubles of ill-health
and ecclesiastical unrest, remained optimistic, tender and
even playful. His principal efforts as a reformer were directed
against the improvement of the liturgy, and the reformation of
the monastic orders of the East. (See Basilian Monks.)

BIBLIOGRAPHY.—Editions of his works appeared at Basel (1522);
Paris, by J. Garnier and P. Maranaus (1721-1730), and by L. de
Sinner (1839). Migne’s Patrolog. ser. graecæ, 49-52; De Spiritu Sancto,
ed. C. F. H. Johnston (Oxford, 1892); Liturgia, ed. J. Robertson
(London, 1894). See also the patalogies, e.g. that of O. Barden-
hewer, and the histories of dogma, e.g. those of A. Harnack and
F. Loofs.

BASIL I. (d. 866), known as the “Macedonian,” Roman
emperor in the East, was born of a family of Armenian (not
Slavonic) descent, settled in Macedonia. He spent a part of his
boyhood in captivity in Bulgaria, where his family was cared for
by the Bulgarian prince Krum in 852. He succeeded to the
throne by way of his own efforts, and was ultimately lucky enough to enter the service of The-
as. a relative of the Caesar Bardas (uncle of Michael III.),
as grooms. It seems that while serving in this capacity he visited
Psarae with his master, and gained the favour of Danielis, a very
wealthy lady of that place, who received him into her household,
and endowed him with a fortune. He earned the notice of
Michael III. by winning a victory in a wrestling match, and soon
became the emperor’s boon companion and was appointed
chamberlain (parakoimōmenos). A man of his stamp, advancing
unsurprisingly on the road of fortune, had no hesitation in
divorce his wife and marrying a mistress of Michael, Eudocia
Ingerina, to please his master. It was commonly believed that
Leo VI., Basil’s successor and reputed son, was really the son of
Michael. The next step was to murder the powerful Caesar
Bardas, who, as the emperor was devoted to amusement, virtu-
ally ruled the empire; this was done with the emperor’s consent
by Basil’s own hand (April 866), and a few weeks later Basil was
raised to the imperial dignity. Hitherto few perhaps had divined
in the unprincipled adventurer, who shared in the debauchies
of the imperial drunkard, the talents of a born ruler. On the
throne he soon displayed the serious side of his nature and his
exceptional capacities for administrative work. In 867, when he
was twenty years of age, he caused his worthless benefactor to be assassinated, and reigned
alone. He inaugurated a new age in the history of the empire,
associated with the dynasty which he founded,—the Mac-
edonian dynasty,—it is usually called; it would be more instructive
to call it “Armenian.” It was a period of territorial expansion,
during which the empire was the strongest power in Europe.
The great legislative work which Basil undertook and his suc-
cessor completed, and which may be described as a revival
of Justinianean law, entitled him to the designation of a second
Justinian (the Basilica, a collection of laws in sixty books; and the
manuscripts known as the Prochoros and Ephraemag. For
this legislation see Basilica and Roman Empire, Later). His
financial administration was prudent. His ecclesiastical policy
was marked by a wish to keep on good terms with Rome. One of
his first acts was to exile the patriarch Photius and restore his
rival Ignatius, whose claims were supported by the pope. Yet
he had no intention of yielding to Rome’s pretensions beyond a
certain point. The decision of the Bulgarian tsar Michael to
submit the new Bulgarian Church to the jurisdiction of Con-
stantinople was a great blow to Rome, who had hoped to secure
it for herself. In 877 Photius became patriarch again, and there
was a virtual though not a formal breach with Rome. Thus the
independence of the Greek Church may be said to date from the
time of Basil. His reign was marked by a troublesome war with
the Paulician heretics, an inheritance from his predecessor;
the death of their able chief Chrysorphor led to the definite
subjection of this little state, of which the chief stronghold was
Tephrice on the upper Euphrates, and which the Saracens had
helped to bid a long defiance to the government of Constantinople.
There was the usual frontier warfare with the Saracens in Asia
Minor. Cyprus was recovered, but only retained for seven years.
Syracuse was lost, but Bari was won back and those parts of
Italy occupied by the Saracens. The last successes opened a new period of Byzantine domination
in southern Italy. Above all, New Rome was again mistress of
the sea, and especially of the gates of the Adriatic. Basil reigned
nineteen years as sole sovereign. His death (29th of August 886)
was due to a fever contracted in consequence of a serious accident
in hunting. A stag dragged him from his horse by fixing its
antlers in his belt. He was saved by an attendant who cut him
loose with a knife. His last act was to cause his saviour to be
beheaded, suspecting him of the intention to kill and not to
rescue. Basil is one of the most remarkable examples of a man,
without education and exposed to the most demoralizing in-
fluences, manifesting extraordinary talents in the government
of a great state, when he had climbed to the throne by acts of
unscrupulous bloodshed.

BASIL II. (c. 955–1025), known as Bulgaroktonos (slayer of
Bulgarians), Roman emperor in the East, son of Romanus II. and
Theophano, great-great-grandson of Basil I., was born about 958
and crowned on the 22nd of April 960. After their father’s death
(963) he and his younger brother Constantine were nominal
emperors during the actual reigns of Nicephorus Phocas, their
stepfather, and John Tzimisces. On the death of the latter (10th
of January 976) they assumed the sovereignty without a colleague,
but throughout their joint reign Constantine exercised no power
and devoted himself chiefly to pleasure. This was in accordance
with the Byzantine principle that in the case of two or more
co-regnant basileis only one governed. Basil was a brave soldier
and a superb horseman; he was to approve himself a strong ruler
and an able general. He did not at first display the full extent of
his energy. The administration remained in the hands of the
eunuch Basilios (an illegitimate son of Romanus I.), president of
the senate, a wily and gifted man, who hoped that the young
emperor would be a puppet. Basil waited and watched without
interfering, and devoted himself to learning the details of
administrative business and instructing himself in military
science. During this time the throne was seriously endangered
by the rebellion of an ambitious general who aspired to play the
part of Nicephorus Phocas or Tzimisces. This was Bards
Sclerus, whom the eunuch deposed from his post of general in the East. He belonged to the powerful landed aristocracy of Asia Minor, whose pretensions were a perpetual menace to the throne. He made himself master of the Asiatic provinces and threatened Constantinople. To oppose him, Bardas Phocas, another general who had revolted in the previous reign and been interned in a monastery, was recalled. Defeated in two battles, he was victorious in a third and the revolt was suppressed (979). Phocas remained general in the East till 987, when he rebelled and was proclaimed emperor by his troops. It seems that the minister Basileios was privy to this act, and the cause was dissatisfaction at the energy which was displayed by the emperor, who showed that he was determined to take the administration into his own hands and personally to control the army. Phocas advanced to the Hellespont and besieged Abydos. Basil obtained timely aid, in the shape of Varangian mercenaries, from his brother-in-law Vladimir, the Russian prince of Kiev, and marched to Abydos. The two armies were facing each other, when Basil galloped forward, seeking a personal combat with the usurper who was riding in front of his lines. Phocas, just as he prepared to face him, fell from his horse and was found to be dead. This ended the rebellion.

The fall of Basileios followed: he was punished with exile and the confiscation of his enormous property. Basil made ruthless war upon the system of immense estates which had grown up in Asia Minor and which his predecessor, Romanus I., had endeavoured to check. (For this evil and the legislation which was aimed at it see Roman Empire, Later.) He sought to protect the lower and middle classes.

Basil gained some successes against the Saracens (995); but his most important work in the East was the annexation of the principalities of Armenia. He created in those highlands a strongly fortified frontier, which, if his successors had been capable, should have proved an effective barrier against the invasions of the Seljuk Turks. The greatest achievement of the reign was the subjugation of Bulgaria. After the death of Tzimisces (who had reduced only the eastern part of the Bulgarian kingdom), the power of Bulgaria was restored by the Tsar Samuel, in whose Basil found a worthy foe. The emperor's first efforts against him were unsuccessful (981), and the war was not resumed till 996, Samuel in the meantime extending his rule along the Adrianople frontier and imposing his lordship on Servia. Eastern Bulgaria was finally recovered in 1000; but the war continued with varying successes till 1014, when the Bulgarian army suffered an overwhelming defeat. Basil blinded 15,000 prisoners, leaving a one-eyed man to every hundred to lead them to their tsar, who faint at the sight and died two days later. The last sparks of resistance were extinguished in 1018, and the great Slavonic realm lay in the dust. The power of Byzantium controlled once more the Illyrian peninsula. Basil died in December 1025 in the midst of preparations to send a naval expedition to recover Sicily from the Saracens.

Basil's reign marks the highest point of the power of the Eastern empire since Justinian I. Part of the credit is due to his predecessors Nicephorus and Tzimisces, but the greater part belongs to him. He dedicated himself unsparingly to the labours of ruling, and he had to reckon throughout with the ill-will of a rich and powerful section of his subjects. He was hard and cruel, without any refinement or interest in culture. In a contemporary palster (preserved in the library of St Mark, at Venice) there is a portrait of him, with a grey beard, crowned and robed in imperial costume.

**BASIL** (Russ. Vasily), the name of four grand-dukes of Moscow and tsars of Muscovy.

**BASIL I. DMITRIEVICH** (1371–1423), son of Dmitrius Donskoı, whom he succeeded in 1389, married Sophia, the daughter of Vitovt, grand-duke of Lithuania. In his reign the grand-duchy of Muscovy became practically hereditary, and asserted its supremacy over all the surrounding principalities. Nevertheless Basil received his *yarluk* or investiture, from the Golden Horde and was compelled to pay tribute to the grand khan, Tokhtamish. He annexed the principality of Suzdal to Moscovy, together with Murom, Kozelsk, Peremysl, and other places; reduced the grand-duchy of Rostov to a state of vassalage; and acquired territory from the republic of Great Novgorod by treaty. In his reign occurred the invasion of Timur (1395), who ruined the Volgan regions, but did not penetrate so far as Moscow. Indeed Timur's raid was of service to the Russian prince as it all but wiped out the Golden Horde, which for the next twelve years was in a state of anarchy. During the whole of this time no tribute was paid to the khan, though vast sums of money were collected in the Moscow treasury for military purposes. In 1408 the Mirza Edige ravaged Muscovite territory from Spaso-Vorotinsk to the Volga, but in 1410, when he came to take Vladimir, Basil found it necessary to pay the long-deferred visit of submission to the Horde. The most important ecclesiastical event of the reign was the elevation of the Bulgarian, Gregory Tsambakl, to the metropolitan see of Kiev (1425) by Vitovt, grand-duke of Lithuania; the immediate political consequence of which was the weakening of the hold of Muscovy on the south-western Russian states. During Basil's reign a terrible visitation of the "Black Death" decimated the population.

**BASIL II., called TEMNY ("the Blind") (1415–1462), son of the preceding, succeeded his father as grand-duke of Moscow in 1425. He was a man of small ability and unusual timidity, though not without tenacity of purpose. Nevertheless, during his reign Moscow steadily increased in power, as if to show that the personality of the grand-dukes had become quite a subordinate factor in its development. In 1430 Basil was seized by his uncle, George of Halicz, and sent a prisoner to Kostroma; disheartened with George, released Basil and in 1433 he returned in triumph to Moscow. George, however, took the field against him and Basil fled to Novgorod. On the death of George, Basil was at constant variance with George's children, one of whom, Basil, he had blinded; but in 1445 the grand-duke fell into the hands of blind Basil's brother, Shemyak, and was himself deprived of his sight and banished to Uglich (1445). The clergy and people, however, being devoted to the grand-duke, assisted him not only to recover his throne a second time, but to put Shemyak to flight, and to seize Halicz, his patrimony. During the remainder of Basil II.'s reign he slowly and unobtrusively added district after district to the grand-duchy of Muscovy, so that, in fine, only the republics of Novgorod and Pskov and the principalities of Tver and Vereya remained independent of Moscow. Yet all this time the realm was overrun continually by the Tatars and Lithuanians, and suffered severely from their depredations. Basil's reign saw the foundation of the Solovetsky monastery and the rise of the khanate of the Crimea. In 1448 the north Russian Church became virtually independent of the patriarchal see of Constantinople by adopting the practice of selecting its metropolitan from among native priests and prelates exclusively.

See S. M. Solovev, *History of Russia* (Russ.), (Petersburg, 1895).

**BASIL III., IVANOVICH (1479–1533), tsar of Muscovy, son of Ivan III. and Sophia Palaeologa, succeeded his father in 1505. A crafty prince, with all the tenacity of his race, Basil succeeded in incorporating with Muscovy the last remnants of the ancient independent principalities, by accusing the princes of Ryan and Syeversk of conspiracy against him, seizing their persons, and annexing their domains (1517–1523). Seven years earlier (24th of January 1510) the last free republic of old Russia, Fskov, was deprived of its charter and assembly-hall, which were sent
to Moscow, and tsarish governors were allowed to rule it. Basil also took advantage of the difficult position of Sigismund of Poland to capture Smolensk, the great eastern fortress of Poland (1512), chiefly through the aid of the rebel Lithuanian, Prince Michael Glinsky, who provided him with artillery and engineers from western Europe. The loss of Smolensk was the first serious injury inflicted by Muscovy on Poland and only the exigencies of Sigismund compelled him to acquiesce in its surrender (1522). Equally successful, on the whole, was Basil against the Tatars. Although in 1519 he was obliged to buy off the khan of the Crimea, Mahommed Girai, under the very walls of Moscow, towards the end of his reign he established the Russian influence on the Volga, and in 1530 placed the pretender Elanyei on the throne of Kazan. Basil was the first grand-ducie of Moscow who adopted the title of tsar and the double-headed eagle of the East Roman empire. By his second wife, Helena Glinska, whom he married in 1536, Basil had a son Ivan, who succeeded him as Ivan IV.

See Sigismund Herberstein, Rerum Moscoviticarum Commentarii (Vienna, 1549); P. A. Rytlov, Russian History Previous to the Reforms of Peter the Great (Russ.), (Petersburg, 1895); E. I. Kashprovsky, The War of Basil III. with Sigismund I. (Russ.), (Nyezhin, 1899).

BASIL IV., SHUISKY (d. 1612), tsar of Muscovy, was during the reign of Theodore I. and Boris Godunov, one of the leading boyars of Muscovy. It was he who, in obedience to the secret orders of Tsar Boris, went to Uglich to inquire into the cause of the death of Demetrius, the infant son of Ivan the Terrible, who had been murdered there by the agents of Boris. Shuisky obsequiously reported that it was a case of suicide; yet, on the death of Boris and the accession of his son Theodore II., the false boyar, in order to gain favour with the first false Demetrius, went back upon his own words and recognized the pretender as the real Demetrius, thus bringing about the assassination of the young Theodore. Shuisky then plotted against the false Demetrius and procured his death (May 1606) also by publicly confessing that the real Demetrius had been indeed slain and that the reigning tsar was an impostor. This was the viler in him as the pseudo-Demetrius had already forgiven him one conspiracy. Shuisky's adherents thereupon proclaimed him tsar (19th May 1606). He reigned till the 10th of July 1610, but was never generally recognized. Even in Moscow itself he had little or no authority, and was only not deposed by the dominant boyars because they had none to put in his place. Only the popularity of his heroic cousin, Prince Michael Glinsky, and the special support of the Roman Church, which he became the battlefield of two princes, and soldiers from Sweden, whose assistance he purchased by a disgraceful cession of Russian territory, kept him for a time on his unstable throne. In 1610 he was deposed, made a monk, and finally carried off as a trophy by the Polish grand hetman, Stanislaus Zolkiewski. He died at Warsaw in 1612.

Tolstoy, Tsar Vasili Shuiskii (Russ.) (Warsaw, 1903); R. Nsiet Bain, Slavonic Europe, ch. viii. (Cambridge, 1907). (R. N. B.)

BASILIAN MONKS, those who follow the rule of Basil the Great. The chief importance of the monastic rule and institute of St Basil lies in the fact that to this day his reconstruction of the monastic life is the basis of the monasticism of the Greek and Slavonic Churches, though the monks do not call themselves Basilians. St Basil's claim to the authorship of the Rules and other ascetical writings that go under his name, has been questioned; but the tendency now is to recognize as his at any rate the two sets of Rules. Probably the truest idea of his monastic system may be derived from a correspondence between St Gregory Nazianzen and his brethren of the monastic life, the chief portions whereof are translated by Newman in the Church of the Fathers, "Basil and Gregory," §§ 4, 5. On leaving Athens Basil visited the monasteries of Egypt and Palestine; in the latter country and in Syria the monastic life tended to become more and more eremitical and to run to great extravagances in the matter of bodily austerities (see Monasticism). When (c. 360) Basil formed his monastery in the neighbourhood of Neocaesarea in Pontus, he deliberately set himself against these tendencies. He declared that the cenobitical life is superior to the eremitical; that fasting and austerities should not interfere with prayer or work; that work should form an integral part of the monastic life, not merely as an occupation, but for its own sake and in order to do good to others; and therefore that monasteries should be near towns. All this was a new departure in monachism. The life St Basil established was strictly cenobitical, with common prayer seven times a day, common work, common meals. It was, in spite of the new ideas, an austere life, of the kind called contemplative, given up to prayer, the reading of the Scriptures and heavy field-work. The so-called Rules (the Longer and the Shorter) are catechisms of the spiritual life rather than a body of regulations for the corporate working of a community, such as is now understood by a monastic rule. Apparently no vows were taken, but obedience, personal poverty, chastity, self-denial, and the other monastic virtues were strongly enforced, and a monk was not free to abandon the monastic life. A novitiate had to be passed, and young boys were to be educated in the monastery, but were not expected to become monks.

St Basil's influence, and the greater suitability of his institute to European ideals, ensured the propagation of Basilian monachism; and Sozomen says that in Cappadocia and the neighbouring wilder parts of Asia Minor there were 200 monasteries. However, the eastern hankering after the eremitical life long survived, and it was only by dint of legislation, both ecclesiastical (council of Chalcedon) and civil (Justinian Code), that the Basilian cenobitic form of monachism came to prevail throughout the Greek-speaking lands, though the eremitical forms have always maintained themselves.

Greek monachism underwent no development or change for four centuries, except the vicissitudes inevitable in all things human, which in monachism assume the form of alternations of relaxation and revival. The second half of the 8th century seems to have been a time of very general decadence; but about the year 800 Theodore, destined to be the only other creative name in Greek monachism, became abbot of the monastery of the Studium in Constantinople. He set himself to reform his monastery and restore St Basil's spirit in its primitive vigour. But to effect this, and to give permanence to the reformation, he saw that there was need of a more practical code of laws to regulate the details of the daily life, as a supplement to St Basil's Rules. He therefore drew up constitutions, afterwards codified (see Michael Patrocl. etc.), which became the norm of life at the Studium, and, gradually spread thence to the monasteries of the rest of the Greek empire. Thus to this day the Rules of Basil and the Constitutions of Theodore the Studite, along with the canons of the Councils, constitute the chief part of Greek and Russian monastic law.

The spirit of Greek monachism, as regenerated by Theodore, may best be gathered from his Letters, Discourses and Testament. Under the abbot were several officials to superintend the various departments; the liturgical services in the church took up a considerable portion of the day, but Theodore seems to have made no attempt to revive the early practice of the Studium in this matter (see Acoemeti); the rest of the time was divided between reading and work; the latter included the chief handicrafts, for the monks, only ten in number, when Theodore became abbot, increased under his rule to over a thousand. One kind of work practised with great zeal and success by the Studite monks, was the copying of manuscripts, so that to them and to the schools which went forth from them we owe a great number of existing Greek MSS., and the preservation of many works of classical and ecclesiastical antiquity. In addition to this, literary and theological studies were pursued, and the mysticism of pseudo-Dionysius was cultivated. The life, though simple and self-denying and hard, was not of extreme austerity. There was a division of the monks into two classes, similar to the division in vogue in later time in the West into choir-monks and lay-brothers. The life of the choir-monks was predominantly contemplative, ¹ Specimen passages, and also a general picture of the life, will be found in Miss Alice Gardner's Theodore of Studium, ch. v.
being taken up with the church services and private prayer and study; the lay-brothers carried on the various trades and external works. There is little or no evidence of works of charity outside the monasteries being undertaken by Studite monks. Strict personal poverty was enforced, and all were encouraged to approach confession and communion frequently. Vows had been imposed on monks by the council of Chalcedon (451). The picture of Studite life is the picture of normal Greek and Slavonic monachism to this day.

During the middle ages the centre of Greek monachism shifted from Constantinople to Mount Athos. The first monastery to be founded here was that of St Athanasius (c. 600), and in the course of the next three or four centuries monasteries in great numbers—Greek, Slavonic and one Latin—were established on Mount Athos, some twenty of which still survive.

Basilian monachism spread from Greece to Italy and Russia. Rufinus had translated St Basil's Rules into Latin (c. 400) and they became the rule of life in certain Italian monasteries. They were known to St Benedict, who refers his monks to "the Rule of our holy Father Basil,"—indeed St Benedict owed more of the ground-ideas of his Rule to St Basil than to any other monastic legislator. In the 6th and 7th centuries there appear to have been Greek monasteries in Rome and south Italy and especially in Sicily. But during the course of the 8th century and a current period of fugitives was poured into southern Italy from Greece and Sicily, under stress of the Saracenic, Arab and other invasions; and from the middle of the 9th century Basilian monasteries, peopled by Greek-speaking monks, were established in great numbers in Calabria and spread northwards as far as Rome. Some of them existed on into the 18th century, but the only survivor now is the monastery founded by St Nilus (c. 1000) at Grottaferrata in the Alban Hills. Professor Kirsopp Lake has (1903) written four valuable articles (Journal of Theological Studies, iv., v.) on "The Greek monasteries of South Italy"; he deals in full detail with their scriptoria and the dispersal of their libraries, a matter of much interest, in that some of the chief collections of Greek MSS. in western Europe—as the Bessarion at Venice and a great number at the Vatican—come from the spoils of these Italian Basilian houses.

Of much greater importance was the importation of Basilian monachism into Russia, for it thereby became the norm of monachism for all the Slavonic lands. Greek monks played a considerable part in the preparation of the Slavonic, and the first Russian of fugitives was founded at Kiev (c. 1050) by a monk from Mount Athos. The monastic institute had a great development in Russia, and at the present day there are in the Russian empire some 400 monasteries of men and 100 of women, many of which support hospitals, almshouses and schools. In the other Slavonic lands there are a considerable number of monasteries, as also in Greece itself, while in the Turkish dominions there are no fewer than 100 Greek monasteries. The monasteries are of three kinds: cenobia proper, wherein full monastic common life, with personal poverty, is observed; others called idiorrhhythmic, wherein the monks are allowed the use of their private means and lead a generally mitigated and free kind of monastic life; and the lavras, wherein the life is semi-eremitical. Greek and Slavonic monks wear a black habit. The visits of Western scholars in modern times to Greek monasteries in search of MSS.—notably to St Catherine's on Mount Sinai, and to Mount Athos—has directed much attention to contemporary Greek monachism, and the accounts of these expeditions commonly contain descriptions, more or less sympathetic and intelligent, of the present-day life of Greek monks. The first study of this subject is Robert Mayer's in part. i. (1818) and iv. (1837) of the Monasteries of the Levant; the most recent in English is Athelstan Riley's Athos (1887). The life is mainly given up to devotional contemplative exercises; the church services are of extreme length; intellectual study is little cultivated; manual labour has almost disappeared; there are many hermits on Athos (q.v.).

The ecclesiastical importance of the monks in the various branches of the Orthodox Church lies in this, that as bishops must be celibate, whereas the parochial clergy must be married, the bishops are all recruited from the monks. But besides this they have been a strong spiritual and religious influence, as is recognized even by those who have scant sympathy with monastic ideals (see Harnack, What is Christianity? Lect. xiii., end).

Outside the Orthodox Church are some small congregations of Uniat Basilians. Besides Grottaferrata, there are Catholic Basilian monasteries in Poland, Hungary, Galicia, Rumania; and among the Melchites or Uniat Syrians.

There have been Baslian nuns from the beginning. St Macrina, St Basil's sister, having established a nunnery which was under his direction. The nuns are devoted to a purely contemplative life, and in Russia, where there are about a hundred nunneries, they are not allowed to take final vows until the age of sixty. They are very numerous throughout the East.

(1853), pp. 453-560; vi. (1856), pp. 279-360. The articles "Mönchtum," "Ordensgemeinschaften," and "Athonisberg," where copious references will be found. (E. C. B.)

BASILICA, a word of Greek origin (see below), frequently used in Latin literature and inscriptions to denote a large covered building that could accommodate a considerable number of people. Strictly speaking, a basilica was a building of this kind situated near the business centre of a city and arranged for the convenience of merchants, litigants and persons engaged on the public service; but in a derived sense the word might be used for any large structure wherever situated, such as a hall of audience (Vitruv, vi. § 2) or a covered promenade (St Jerome, Ep. 46) in a private palace; a riding school (basilica equestris exercitatoria, C.I.L. vii. 605); a market or store for flowers (basilica flossellaria [Notitia]), or other kinds of goods (basilica vestitaria, C.I.L. viii. 2015), or a hall of meeting for a religious body. In this derived sense the word came naturally to be applied to the extensive buildings used for Christian worship in the age of Constantine and his successors.

The question whether this word conveyed to the ancients any special connotation of a place of worship is a difficult one, and some writers hold that the word was betokened on the one side of the building, others that it suggested also a certain form. Our knowledge of the ancient basilica as a civil structure is derived primarily from Vitruvius, and we learn about it also from existing remains and from incidental notices in classical writers and in inscriptions. If we review all the evidence we are led to the conclusion that there did exist a normal form of the building, though many examples deviated therefrom. This normal form we shall understand if we consider the essential character of the building in the light of what Vitruvius tells us of it.

Vitruvius treats the basilica in close connexion with the forum, to which in his view it is an adjunct. In the earlier classical times, both in Greece and Italy, business of every kind, political, commercial and legal, was transacted in the open forum, and there also were presented shows and pageants. When business increased and the numbers of the population were multiplied, it was found convenient to provide additional accommodation for these purposes. Theatres and amphitheatres took the performance of games. Markets provided for those that bought and sold, while for business of more important kinds accommodation could be secured by laying out new agoria or fora in the immediate vicinity of the old. At Rome this was done by means of the so-called imperial fora, the latest and most splendid of which was that of Trajan. These fora corresponded to the later Greek or Hellenistic agora, which, as Vitruvius tells us, was of regular form and surrounded by colonnades in two stories, and they had the practical use of relieving the pressure on the
BASILICA

original forum (Cic., ad Att. iv. 16). The basilica was a structure intended for the same purposes. It was to all intents and purposes a covered forum, and in its normal form was constituted by an arrangement of colonnades in two stories round a rectangular space, that was not, like the Greek agora, open, but covered with a roof. Vitruvius writes of it as frequented by merchants, who would find in it shelter and quiet for the trans- action of their business. Legal tribunals were also set up in it, though it is a mistake to suppose the basilica a mere law court. The magistrates who presided over these tribunals had sometimes platforms, curved or rectangular in plan, provided as part of the permanent fittings of the edifice.

According to Vitruvius (v. i. 4, cf. also vi. 3. 9) the building is to be in plan a rectangle, not more than three times nor less than twice as long as it is broad. If the site oblige the length to be greater, the surplus is to be cut off to form what he calls chalcidica, by which must be meant open vestibules. The interior is divided into a central space and side aisles one-third the width of this. The ground plan of the basilica at Pompeii (fig. 1) illustrates this description, though the superstructure did not correspond to the Vitruvian scheme. The columns between nave and aisles, Vitruvius proceeds, are the same height as the width of the latter, and the aisle is covered with a flat roof forming a terrace (contignatio) on which people can walk. Surrounding this on the inner side is a breastwork or parapet (pluteum), which would conceal these promenaders from the view of the merchants in the basilica below. On the top of this parapet stood the upper row of columns, three-quarters as high as the lower ones. The spaces between these columns, above the
dedicated in the later Greek cities, is hard to say. We should naturally look in that direction for the prototypes of the Roman basilicas, but as a fact we are not informed of any very early basilicas in these cities. The earliest we know of is the existing basilica at Pompeii, that may date back into the 2nd century B.C., whereas basilicas made their appearance at Rome nearly at the beginning of that century. The first was erected by M. Porcius Cato, the censor, in 184 B.C., and was called after his name Basilica Porcia. Cato had recently visited Athens and had been struck by the beauty of the city, so that it is quite possible that the inspiration was direct.

Rome soon obtained other basilicas, of which the important Basilica Fulvia-Aemilia came next in point of time, till by the age of Augustus there were at least five in the immediate neighbour- bourhood of the forum, the latest and most extensive being the Basilica Julia, which ran parallel to its southern side, and is shown in plan in fig. 2. The great Basilica Ulpia was built

by Trajan in connexion with his forum about A.D. 112, and a fragment of the Capitoline plan of Rome gives the scheme of it (fig. 3), while an attempted restoration of the interior by Canina is shown in fig. 4. The vaulted basilica of Maxentius or Constantine on the Via Sacra dates from the beginning of the 4th century, and fig. 5 gives the section of it. The number of public basilicas we read of at Rome alone amounts to about a score, while many private basilicas, for business or recreation, must also have existed, that in the palace of Domitian on the Palatine being the best known. In provincial cities in Italy, and indeed all over the empire, basilicas were almost universal, and in the case of Italy we have proof of this as early as the date of the death of Augustus, for Suetonius (Aug. 100) tells us that the body of that emperor, when it was brought from Nola in Campania to Rome, rested "in basilica cuiusque oppidi."

As regards existing examples, neither in the peninsula nor the provinces can it be said that these give any adequate idea of

![Fig. 1.—Basilica at Pompei. 1, Portico (Chalcidicum); 2, hall of basilica; 3, aisles; 4, altar; 5, tribunal; 6, offices.](image)

![Fig. 2.—Plan of Basilica Julia, Rome. (From Baedeker's Central Italy, by permission of Karl Baedeker.)](image)

Chester (?) and Lincoln, while three others are mentioned in inscriptions (C.I.L. vii. 287, 445, 863).

A comparison of the plans of existing basilicas shows considerable variety in form. Some basilicas (Julia, Ulpia, Pompeii) have the central space surrounded by galleries supported on columns or piers, according to the normal scheme, and the newly excavated Basilica Aemilia, north of the Roman forum, agrees with these. In some North African examples, in the palace basilica of Domitian, and at Silchester, there are colonnades down the long sides but not across the ends. Others (Trier [?], Timgad) have no interior divisions. One (Maxentius) is entirely a vaulted structure and in form resembles the great halls of the Roman Thermae. At Pompeii, Timgad and Silchester, there are fixed tribunals, while vaulted apses that may have contained tribunals occur in the basilica of Maxentius. In the Basilica Julia there was no tribunal at all, though we know that the building was regularly used for the centumviral court (Quint. xii. 5. 6); and the same was the case in the Ulpia, for the semicircular projection at the end shown on the Capitoline-plan, was not a vaulted apse and was evidently distinct from the basilica.

In view of the above it might be questioned whether it is safe to speak of a normal form of the basilica, but when we consider the vast number of basilicas that have perished compared to the few that have survived, and the fact that the origins and traditions of the building show it to have been, as Vitruvius describes it, essentially a columned structure, there is ample justification for the view expressed earlier in this article. There can be little doubt that the earlier basilicas, and the majority of basilicas taken as a whole, had a central space with galleries, generally in two stories, round it, and some arrangement for clerestory lighting. Later basilicas might vary in architectural scheme, while affording the same sort of accommodation as the older ones.

The relation of the civil basilica of the Romans to the Christian church has been extensively discussed, and the reader will find the controversy ably summarized in Kraus's Geschichte der christlichen Kunst, bk. 5. There is nothing remarkable in the fact that a large church was called a basilica, for the term was applied, as we have seen, to structures of many kinds, and we even find "basilica" used for the meeting-place of a pagan religious association (Röm. Mitt. 1891, p. 109). The similarity in some respects of the early Christian churches to the normal form of the columned basilica is so striking, that we can understand how the theory was once held that Christian churches were the actual civil basilicas turned over from secular to religious uses. There is no evidence for this in the case of public basilicas, and it stands to reason that the demands on these for secular purposes would remain the same whether Christianity were the religion of the empire or not. Moreover, though there are one or two civil basilicas that resemble churches, the latter differ in some most important respects from the form of the basilica that we have recognized as normal. The early Christian basilicas, at any rate in the west, had very seldom, if ever, galleries over the side aisles, and their interior is always dominated by the semidome of an apse that terminates the central nave, whereas, with the doubtful exception of Silchester (Archäologia, lxi. 549), there is no instance known of a vaulted apse in a columned civil basilica of the normal kind.

When buildings were first expressly erected for Christian worship, in the 3rd or perhaps already in the 2nd century A.D. (Leclercq, Manuel, ch. iii. "Les édifices chrétiens avant la paix de l'église"), they probably took the form of an oblong interior
terminated by an apse. After the time of Constantine, when the numbers of the faithful were enormously increased, side aisles were added, and in this way the structure came to assume an appearance similar to that of the civil basilica. A striking confirmation of this view has recently come to light at S. Saba on the Aventine at Rome, where a small and very early church, without aisles, has been discovered beneath the floor of the present basilica.

There are, on the other hand, instances in which private basilicas in palaces and mansions were handed over to the Christians for sacred uses. We know that to have been the case with the basilicas of S. Croce in Jerusalem and S. Maria Maggiore at Rome, which originated in the halls of the Sessorian and Liberian palaces respectively, granted by Constantine to the Christians. We may adduce also as evidence of the same practice a passage in bk. x. ch. 71 of the theological romance known as The Recognitions of Clement, probably dating from the early half of the 3rd century, in which we are told that Theophilus of Antioch, on his conversion by St Peter, made over "the basilica of his house" for a church. But however this may have been, with, perhaps, the single exception of S. Croce, the existing Christian basilicas were erected from the ground for their sacred purpose. At Rome the columns, friezes and other materials of the desecrated temples and public buildings furnished abundant materials for their construction. The decadence of art is plainly shown by the absence of rudimentary architectural knowledge in these reconstructions. Not only are columns of various heights and diameters made to do duty in the same colonnade, but even different orders stand side by side (e.g. Ionic, Corinthian and Composite at S. Maria in Trastevere); while pilasters assume a horizontal position and serve as entablatures, as at S. Lorenzo fuori le Mura. There being no such quarry of ready-worked materials at Ravenna, the noble basilicas of that city are free from these defects, and exhibit greater unity of design and harmony of proportions.

An early Christian basilica may be thus described in its main features:—A porch supported on pillars (as at S. Clemente) gave admission into an open court or atrium, surrounded by a colonnaded cloister (S. Clemente, Old St Peter's, S. Ambrogio at Milan, Parenzo). In the centre of the court stood a cistern or fountain (cantharus, phiale), for drinking and ablutions. In close contiguity to the atrium, often to the west, was the baptistery, usually octagonal (Parenzo). The church was entered through a long narrow porch (narthex), beyond which penitents, or those under ecclesiastical censure, were forbidden to pass. Three or more lofty doorways, according to the number of the aisles, set in marble cases, gave admission to the church. The doors themselves were of rich wood, elaborately carved with sculptural subjects (S. Sabina on the Aventine), or of bronze similarly adorned and often gilt. Magnificent curtains, frequently embossed with sacred figures or scenes, closed the entrance, keeping out the heat of summer and the cold of winter.

The interior consisted of a long and wide nave, sometimes as much as 80 ft. across, terminating in a semicircular apse, with one or sometimes (St Paul's, Old St Peter's, St John Lateran) two aisles on each side, separated by colonnades of marble pillars supporting horizontal entablatures (Old St Peter's, S. Maria Maggiore, S. Lorenzo) or arches (St Paul's, S. Agnese, S. Clemente, the two basilicas of S. Apollinare at Ravenna). Above the pillars the clerestory wall rose to a great height, pierced in its upper part by a range of plain round-headed windows. The space between the windows and the colonnade (the later triforium-space) was usually decorated with a series of mosaic pictures in panels. The colonnades sometimes extended quite to the end of the church (the Ravenna basilicas), sometimes ceased some little distance from the end, thus admitting the formation of a transverse aisle or transept (St Paul's, Old St Peter's, St John Lateran). Where this transept occurred it was divided from the nave by a wide arch, the face and sofit of which were richly decorated with mosaics. Over the crown of the arch we often find a bust of Christ or the holy lamb lying upon the altar, and, on either side, the evangelistic symbols, the seven candlesticks and the twenty-four elders. Another arch spanned the semicircular apse, in which the church always terminated. From Carolingian times this was designated the arch of triumph, because a cross was suspended from it.

The conch or semi-dome that covered the apse was always covered with mosaic pictures, usually paintings of our Lord, either seated or standing, with St Peter and St Paul, and other apostles and saints, on either hand. The beams of the roof were sometimes concealed by a flat ceiling, richly carved and girt. The altar, standing in the centre of the chord of the apse on a raised platform reached by flights of steps, was rendered conspicuous by a lofty canopy supported by marble pillars (eborium, baldacchino), from which depended curtains of the richest materials. Beneath the altar was the confessio, a subterranean chapel, containing the body of the patron saint, and relics of other holy persons. This was approached by descending flights of steps from the nave or aisles. The confessio in some cases reproduced the original place of interment of the patron saint, either in a catacomb-chapel or in an ordinary grave, and thus formed the sacred nucleus round which the church arose. We have good examples of this arrangement at St Peter's and St Paul's at Rome, and S. Apollinare in Classe, Ravenna. It was copied in the original cathedral of Canterbury. The bishop or officiating presbyter advanced from his seat in the centre of the semicircle of the apse to the altar, and celebrated the Eucharist with his face to the congregation below. At the foot of the altar steps a raised platform, occupying the upper portion of the nave, formed a choir for the singers, readers and other inferior clergy. This oblong space was separated from the aisles and from the western portion of the nave by low marble walls or railings (cancelli). From these walls projected ambones or pulpits with desks, also of marble, ascended by steps.

The exterior of the basilicas was usually of an extreme plainness. The vast brick walls were unrelieved by ornament, save occasionally by arcading as at S. Apollinare in Classe, Ravenna, and had no compensating grace of outline or beauty of proportion. An exception was made for the entrancefront, which was sometimes covered with plates of marble mosaics or painted stucco (Old St Peter's, S. Lorenzo). But in spite of any decorations the external

Fig. 7.—Plan of Basilica adjoining the Forum of the Roman city at Silchester, Hants.
(From Archæologia, vol. iii.)

Fig. 8.—S. Apollinare in Classe, Ravenna.
example. The campanile is a later addition. Within, apart from the beautiful mosaic decoration, a fine effect was produced by the arch of triumph and the apse, which terminated the nave and dominated the whole vast space of the interior.

To pass from general description to individual churches, the first place must be given, as the earliest and grandest examples of the type, to the world-famous Roman basilicas; those of St Peter, St Paul and St John Lateran. “omnia urbis et orbis ecclesiarum mater et caput.” It is true that no one of these exists in its original form, Old St Peter’s having been entirely removed in the 16th century to make room for its magnificent successor; and both St Paul’s and St John Lateran having been greatly injured by fire, and the last named being so completely modernized as to have lost all interest. Of the two former, however, we possess drawings and plans and minute descriptions, which give an accurate conception of the original buildings. To commence with St Peter’s, from the illustrations annexed (figs. 9, 10, 11) it will be seen that the church was entered through a vast colonnaded atrium, 212 ft. by 235 ft., with a fountain in the centre,—the atrium being preceded by a porch mounted by a noble flight of steps. The church was 212 ft. wide by 380 ft. long; the nave, 80 ft. in width, was six steps lower than the side aisles, of which there were two on each side. The four dividing colonnades were each of twenty-two Corinthian columns. Those next the nave supported horizontal entablatures. The inner colonnades bore arches, with a second clerestory. The main clerestory walls were divided into two rows of square panels containing mosaics, and had windows above. The transept projected beyond the body of the church,—a very unusual arrangement. The apse, of remarkably small dimensions, was screened off by a double row of twelve wreathed columns of Parian marble. The pontifical chair was placed in the centre of the curve of the apse, on a platform raised several steps above the presbytery. To the right and left the seats of the cardinals followed the line of the apse. At the centre of the chord stood the high altar beneath a ciborium, resting on four pillars of porphyry. Beneath the altar was the subterranean chapel, the centre of the devotion of so large a portion of the Christian world, believed to contain the remains of St Peter; a vaulted crypt ran round the foundation wall of the apse in which many of the popes were buried. The roof showed its naked beams and rafters.

The basilica of St Paul without the walls, dedicated 324 A.D., rebuilt 388–425, remained in a sadly neglected state, but substantially unaltered, till the disastrous fire of 1823, which reduced the nave to a calcined ruin. Its plan and dimensions (figs. 12, 13) were almost identical with those of St Peter’s.

The only parts of the modernised five-aisled basilica of St John Lateran (of which we have a plan in its original state, Agincourt, pl. lxxxiii. No. 22) which retain any interest, are the double-vaulted aisle which runs round the apse, a most unusual arrangement, and the baptistery. The latter is an octagonal building standing some little distance from the basilica to the south. Its roof is supported by a double range of columns, one above the other, encircling the baptismal basin sunk below the floor. Of the three-aisled basilicas the best example is the Liberian or S. Maria Maggiore. The first of the modernized basilicas, in which the plan has been changed little, is the Lateran,—fig. 12.—Ground-Plan of the Lateran Basilica, before its destruction by fire. a, Atrium. b, Nave. c, E. cloister. d, Altar. e, Bema. f, Side aisles. g, Apse.

Fig. 13.—Section of the Basilica of St Paul, Rome.
date from the pontificate of Sixtus III., 432-440. The face of
the arch of triumph presents also a series of mosaics illustrative
of the infamy of our Lord, of great value in the history of art.
The apse is of later date, reconstructed by Paschal I. in 818.

Of the remaining Roman basilicas that of S. Sabina on the
Aventine is of special interest as its interior, dating from about
A.D. 430, has preserved more of the primitive aspect than any
other. Its carved wooden doors of early Christian date are of
unique value, and in the spandrils of its inner arcades, upborne
by splendid antique Corinthian columns, are some good specimens
of opus sectile or mosaic of cut marble. The ancient roof is an
open one. The basilicas of S. Lorenzo fuori le Mura and S.
Agnesse deserve particular notice, as exhibiting galleries corres-
ponding to those of the civil basilicas and to the later triclinium,
carried above the aisles and returned across the entrance end.
It is doubtful, however, whether these galleries are part of the
original schemes. The architectural history of S. Lorenzo's is
curious. When originally constructed in A.D. 432, it consisted
of a short nave of six bays, with an internal narthex the whole
height of the building. In the 15th century Honorius III. dis-
oriented the church by pulling down the apse and erecting a
nave of twelve bays on its site and beyond it, thus converting
the original nave into a square-ended choir, the level being much
raised, and the magnificent Corinthian columns half buried.
As a consequence of the church being thus shifted completely round,
the face of the arch of triumph, turned away from the present
entrance, but towards the original one, is invested with the usual
mosaics (Agincourt, pl. xxviii. Nos. 29, 30, 31). The basilica of S.
Agnesse, of which we give a section (fig. 14), is a small but

![Fig. 14.—Section of Basilica of S. Agnesse at Rome.]

interesting building, much like what S. Lorenzo must have been
before it was altered.

Though inferior in size, and later in date than most of the
basilicas already mentioned, that of S. Clemente is not surpassed
in interest by any one of them. This is due to its having retained
its original Roman arrangements and church fittings more per-
fectly than any other. These fittings have been removed from
the earlier church, lying below the existing building, which at
some unknown date and for some unrecorded reason was
abandoned and filled up with earth, while a new building was
erected upon it as a foundation. The most probable account is
that the earlier church was so completely overwhelmed in the
ruin of the city in 1084, when Robert Guiscard burnt all the
public buildings from the Lateran to the Capitol, that it was
found simpler and more convenient to build a new edifice at a
higher level than to repair the old one. The annexed plan
(fig. 15) and view (fig. 16) show the peculiarities of the existing
building. The church is preceded by an atrium, the only perfect
example remaining in Rome, in the centre of which is the can-
thorus or fountain for ablutions. The atrium is entered by a
portico made up of earlier fragments very carelessly put together.
The chorus cantorum, which occupies about one-third of the nave,
is enclosed by a low marble screen, about 3 ft. high, a work of
the 9th century, preserved from the old church but newly
arranged. The white marble slabs are covered with patterns
in low relief, and are decorated with ribbons of glass mosaic of
the 13th century. These screen-walls stand quite free of the
pillars, leaving a passage between. On the ritual north wall
the gospel-ambo, of octagonal form, with a double flight of steps
westwards and eastwards. To the west of it stands the great
Paschal candlestick, with a spiral shaft, decorated with mosaic.
Opposite, to the south, is the epistle-ambo, square in plan, with
two marble reading desks facing east and west, for the reading of
the epistle and the gradual respectively. The sanctuary is
raised two steps above the choir, from which it is divided by
another portion of the same marble screen. The altar stands
beneath a lofty ciborium, supported by marble columns, with a

![Fig. 15.—Plan of Basilica of S. Clemente in Rome.

prismatic block bearing a sculptured cross intervening with
very happy effect between the capital and the arch. Below the
windows a continuous band of humanity figures, male on one side
and female on the other, advancing in stately procession towards
Our Lord and the Virgin Mother respectively, affords one of
the most beautiful examples of mosaic ornamentation to be found.

![Fig. 16.—Interior of S. Clemente in Rome.]

the nave 51 ft. wide, separated from the single aisles by
colonnades of twenty-two pillars, supporting arches, a small
in any church (fig. 17). The design of the somewhat later and smaller church of S. Apollinare in Classe, A.D. 538–549, measuring 216 ft. by 104 ft., is so similar that they must have proceeded from the same architect (Agincourt, pl. lxxiii. No. 35).

The cathedral on the island of Torcello near Venice, originally built in the 7th century, but largely repaired c. A.D. 1000, deserves special attention from the fact that it preserves, in a more perfect state than can be seen elsewhere, the arrangements of the seats in the apse (fig. 18). The bishop's throne occupies the centre of the arc, approached by a steep flight of steps. Six rows of stone benches for the presbyters, rising one above another like the seats in a theatre, follow the curve on either side—the whole being singularly plain and almost rude. The altar stands on a platform; the sanctuary is divided from the nave by a screen of six pillars. The walls of the apse are inlaid with plates of marble. The church is 125 ft. by 75 ft. The narrow aisles are only 7 ft. in width. Another very remarkable basilica, less known than it deserves to be, is that of Parenzo in Istria, c. A.D. 542. Few basilicas have sustained so little alteration. From the annexed ground-plan (fig. 19) it will be seen that it retains its atrium and a baptistery, square without, octagonal within, to the west of it. Nine pillars divide each aisle from the nave, some of them borrowed from earlier buildings. The capitals are Byzantine. The choir occupies the three easternmost bays. The apse, as at Torcello, retains the bishop's throne and the bench for the presbyters apparently unaltered. The mosaics are singularly gorgeous, and the apse walls, as at Torcello, are inlaid with rich marble and mother-of-pearl. The dimensions are small—121 ft. by 32 ft. (See Kunstdenkmale des österreichischen Kaiserreichs, by Dr G. Heider and others.)

In the Eastern church, though the erection of St Sophia at Constantinople introduced a new type which almost entirely superseded the old one, the basilican form, or as it was termed dromical, from its shape being that of a race-course (dromes), was originally as much the rule as in the West. The earliest church of which we have any clear account, that of Paulinus at Tyre, A.D. 313–322, described by Eusebius (Hist. Eccl. x. 4 § 37), was evidently basilican, with galleries over the aisles, and had an atrium in front. That erected by Constantine at Jerusalem, on the side of the Holy Sepulchre, 333, followed the same plan (Euseb., Vit. Const. iii. c. 20), as did the original churches of St Sophia and of the Apostles at Constantinople. Both these buildings have entirely passed away, but we have an excellent example of an oriental basilica of the same date still standing in the church of the Nativity at Bethlehem, rebuilt by Justinian in the 6th century (fig. 20). Here we find an oblong atrium, a vestibule or narthex, double aisles with Corinthian columns, and a transept, each end of which terminates in an apse, in addition to that in the usual position. Beneath the centre of the transept is the subterranean church of the Nativity (Vogüé, Les Églises de la Terre Sainte, p. 46).

Constantinople preserved till recently a basilican church of the 5th century, that of St John Studios, 463, now a ruin. It had a nave and side aisles divided by columns supporting a horizontal entablature, with another order supporting arches forming a gallery above. There was the usual apsidal termination. The chief difference between the Eastern and Roman basilicas is in the galleries. This feature is very rare in the West, and only occurs in some few examples, the antiquity of which is questioned at Rome but never at Ravenna. It is, on the other hand, a characteristic feature of Eastern churches, the galleries being intended for women, for whom privacy was more studied than in the West (Salzenberg, Alchrist. Baudenkmalen von Constantinople).

Other basilican churches in the East which deserve notice are those of the monastery of St Catherine on Mt. Sinai built by Justinian, that of Dama between Antioch and Bir of the same date, St Philip at Athens, Bosra in Arabia, Xanthus in Lycia, and the very noble church of St Demetrius at Thessalonica.

Views and descriptions of most of these may be found in Texier and Pullan's Byzantine Architecture, Couchaud's Choix d'églises byzantines, and the works of the count de Vogüé. In the Roman province of North Africa there are abundant remains of early Christian churches, and S. Gsell, Les Monuments antiques de l'Algérie, has noticed more than 130 examples. Basilicas of strictly early Christian date are not now to be met with in France, Spain or Germany, but the interesting though very plain "Basse Œuvre" at Beauvais may date from Carolingian times, while Germany can show at Michelstadt in the Odenwald an unaltered basilica of the time of Charles the Great. The fine-columbed basilica of St Mauritius near Hildesheim, dates from the 11th century, and the basilican form has been revived in the noble modern basilica at Munich.

England can show more early of the Nativity, Bethléem Christian survivals than France or hem. 1, Narthex; 2, nave; Germany. In the course of the ex-3. 3, aisles.

cavation of the Roman city of Silchester, there was brought to light in 1802 the remains of a small early Christian basilica dating from the 4th century of which fig. 21 gives the plan (Archaeologia, vol. liii.). It will be
noted that the apse is flanked by two chambers, of the nature of sacrarii, cut off from the rest of the church, and known in ecclesiastical terminology as prothesis and diaconicon. These features, rare in Italy, are almost universal in the churches of North Africa and Syria. Another existing English basilica of early date is that of Brixworth in Northamptonshire, probably erected by Saxulph, abbot of Peterborough, c.d. 680.

It consisted of a nave divided from its aisles by quadrangular piers supporting arches turned in Roman brick, with clerestory windows above, and a short chancel terminating in an apse, outside which, as at St Peter at Rome, an area was marked off by steps from the chancel. At the west end was a square porch, the walls of which were carried up later in the form of a tower. The first church built in England under Roman influence was the original Saxon cathedral of Canterbury. From the annexed ground-plan (fig. 22), as conjecturally restored from Eadmer's description, we see that it was an aisled basilica, with an apse at either end, containing altars standing on raised platforms approached by steps. Beneath the eastern platform was a crypt, or confessio, containing relics, "fabricated in the likeness of the confessionary of St Peter at Rome" (Eadmer). The western apse, dedicated to the Blessed Virgin, contained the bishop's throne. From this and other indications Willis thinks that this

A. High altar. G. Our Lady's altar. H. Bishop's throne.
B. Altar of our Lord. I. North porch containing crypt.
C. Steps to crypt. J. South porch with altar.
D. Crypt. K. Archbishop Odo's tomb.

was the original altars end, the eastern apse being a subsequent addition of Archbishop Odo, c. 550, the church having been thus turned from west to east, as at the already-described basilica of S. Lorenzo at Rome. The choir, as at St. Clemente's, occupied the eastern part of the nave, and like it was probably enclosed by breast-high partitions. There were attached porches to the north and south of the nave. The main entrance of the church was through that to the south. At this sukhure, according to Eadmer, "all disputes from the whole kingdom, which could not legally be referred to the king's court, or to the hundreds and counties, received judgment." The northern porch contained a school for the younger clergy.

BASILICA, a code of law, drawn up in the Greek language, with a view to putting an end to the uncertainty which prevailed throughout the East Roman empire in the 9th century as to the authorized sources of law. This uncertainty had been brought about by the conflicting opinions of the jurists of the 6th century as to the proper interpretation to be given to the legislation of the emperor Justinian, from which had resulted a system of teaching which had deprived that legislation of all authority, and the imperial judges at last were at a loss to know by what rules of law they were to regulate their decisions. An endeavour had been made by the emperor Leo the Isaurian to remedy this evil, but his attempted reform of the law had been rather calculated to increase its uncertainty; and it was reserved for the Byzantine to show himself worthy of the throne, which he had usurped, by purifying the administration of justice and once more reducing the law into an intelligible code. There has been considerable controversy as to the part which the emperor Basil took in framing the new code. There is, however, no doubt that he abrogated in a formal manner the ancient laws, which had fallen into desuetude, and the more probable opinion would seem to be, that he caused a revision to be made of the ancient laws which were to continue in force, and divided them into forty books, and that this code of laws was subsequently enlarged and distributed into sixty books by his son Leo the Philosopher.

A further revision of this code is stated to have been made by Constantine Porphyrogenitus, the son and successor of Leo, but this statement rests only on the authority of Theodor Balsamon, a very learned canonist of the 12th century, who, in his preface to the Nomocanon of Patriarch Photius, cites passages from the Basilica which differ from the text of the code as revised by the emperor Leo. The weight of authority, however, is against any further revision of the code having been made after the formal revision which it underwent in the reign of the emperor Leo, who appointed a commission of jurists under the presidency of Symmachus, the captain of the body-guard, to revise the work of his father, to which he makes allusion in the first of his Novellae. This latter conclusion is the more probable from the circumstance, that the text of the code, as revised by the emperor Leo, agrees with the citations from the Basilica which occur in the works of Michael Psellus and Michael Attalides, both of them high dignitaries of the court of Constantine, who lived a century before Balsamon, and who are silent as to any second revision of the code having taken place in the reign of Constantine Porphyrogenitus, as well as with other citations from the Basilica, which are found in the writings of Mathaeus Blastares and of Constantine Harenopoulus, both of whom wrote shortly after Balsamon, and the latter of whom was far too learned a jurist and too accurate a lawyer to cite any but the official text of the code.

Authors are not agreed as to the origin of the term Basilica, by which the code of the emperor Leo is now distinguished. The code itself appears to have been originally entitled The Revision of the Ancient Laws (ἡ ἀνακαθάρσις τῶν παλαιῶν νόμων); next there came into use the title ἡ εἰκοσανόμια, derived from the division of the work into sixty books; and finally, before the conclusion of the 10th century, the code came to be designated αἱ ἀνακαθάρσις, τὰ αἱ ἀνακαθάρσις, being elliptical forms of ἡ αἰτιτιμομική νόμων and τὰ ἀνακαθάρσις νόμων, namely the Imperial Law or the Imperial Constitutions. This explanation of the term "Basilica" is more probable than the derivation of it from the name of the father of the emperor Leo, inasmuch as the Byzantine jurists of the 11th and 12th centuries ignored altogether the part which the emperor Basil had taken in initiating the legal reforms, which were completed by his son; besides the name of the father of the emperor Leo was written αἰτιτιμομική, from which substantive, according to the genius of
BASILICA—BASILIDES

The ancient Greek language, the adjective "basilikos" could not well be derived.

No perfect MS. has been preserved of the text of the Basilica, and the existence of any portion of the code seems to have been ignored by the jurists of western Europe, until the important bearing of it upon the study of the Roman law was brought to their attention by Viglius Zulchenus, in his preface to his edition of the Greek Paraphrase of Theophilus, published in 1533. This century, elapsed, after publication of the first volume (1533-1537) edited by K. W. E. Heimbach and G. E. Heimbach. It may seem strange that so important a body of law as the Basilica should not have come down to us in its integrity, but a letter has been preserved, which was addressed by Mark the patriarch of Alexandria to Theodorus Balsamon, from which it appears that copies of the Basilica were in the 12th century very scarce, as the patriarch was unable to procure a copy of the work. The great bulk of the code was an obstacle to the making of copies of it, whilst the necessity for them was in a great degree superseded by the publication from time to time of synopses and encheiridia of its contents, composed by the most eminent jurists, of which a very full account will be found in the Historia genet Byzantina, by the advocate Morseth, published in Paris in 1846.

BASILICA, a territorial division of Italy, now known as the province of Potenza, which formed a part of the ancient Lucania (q.v.). It is bounded N. by the province of Foggia, N. E. by those of Bari and Lecce, E. by the Gulf of Taranto (for a distance of 24 m.), S. by the province of Cosenza, and W. by the Mediterranean (for a distance of 10 m. only), and by the provinces of Salerno and Avellino. It has an area of 3845 sq. m. The province is as a whole mountainous, the highest point being the Monte Pollino (7325 ft.) on the boundary of the province of Cosenza, while the Monte Vulture, at the N.W. extremity, is an extinct volcano (4365 ft.). It is traversed by five rivers, the Bradano, Basento, Cavone or Salandra, Agri and S. It long, the Bradano, is 104 m. in length; all run S.E. or E. into the Gulf of Taranto. The province is traversed from W. to E. by the railway from Naples to Taranto and Brindisi, which passes through Potenza and reaches at Metaponto the line along the E. coast from Taranto to Brindisi. A branch line runs a from Foggia to Via Melfi to Rocchetta S. Antonio, a junction for Foggia, Gioia del Colle and Avellino (the second of these two lines runs through the province of Potenza as far as Palazzo S. Gervasio), while a branch S. from the Naples and Taranto line at S. Giovanni terminates at Lagonero, on the W. edge of the province. Communications are rendered difficult by the mountainous character of the interior. The mountains are to some extent clothed with forests; in places the soil is fertile, especially along the Gulf of Taranto, though here malaria is the cause of inefficient cultivation. Olive-oil is the most important product. The total population of the province was 95,000 in 1910. The chief towns are Potenza (pop. 1901, 16,186), Avigliana (18,313), Matera (17,327), Melfi (14,464), Rionero in Vulture (11,800), Lauria (10,000).

BASILIDES, one of the most conspicuous exponents of Gnosticism, was living at Alexandria probably as early as the first decades of the 2nd century. It is true that Eusebius, in his Chronicle, dates his first appearance from A.D. 133, but according to Eusebius to the reign of Elagabalus. A branch line runs a polemic against him, so that his activity may perhaps be set back to a date earlier than 138. Basilides wrote an exegetical work in twenty-four books on his gospel, but which this was not known. In addition to this there are certain writings by his son Isidorus (Pseudepigrapha, "E". "E"), on the prophet Parchon (Parchon), "Ithaka." The surviving fragments of these works have been collected and commented on in Hilgenfeld's Ketzergeschichte, 207-218. The most important fragment published by Hilgenfeld is that of the 13th book of the Exegetica, in the Acta Archelai et Monteis c. 55, only became known in its complete form later, and was published by L. Traube in the Sitzungsberichte der Munchener Akad., phil. histor. Kl. (1903), pp. 533-549. Irenaeus (Acta Haer. iv. 24 §§ 3-7) gives a sketch of Basilides' school of thought, perhaps derived from Justin's Syntagma. Closely related to this is the account in the Syntagma of Hippolytus, which is preserved in Epiphanius, Haer. 24, Philaster, Haer. 32, and Pseudo-Tertullian, Haer. 4. These are completed and confirmed by a number of scattered notices in the Stromateis of Clemens Alexandrinus. An essentially different account, with a pronounced monistic tendency, is presented by the so-called Philosophumena of Hippolytus (vi. 20-27; x. 14). Whether this last account, or that given by Irenaeus and in the Syntagma of Hippolytus, represents the original system of Basilden, has been the subject of a long controversy. (See Hilgenfeld p. 205, note 337.) The most recent opinion tends to decide against the Philosophumena; for, in its composition, Hippolytus appears to have used as his principal source the compendium of a Gnostic author who has introduced into most of the systems treated by him, in addition to the employment of older sources, his own opinions or those of his sect. The Philosophumena, therefore, cannot be taken into account in describing the teaching of Basilides (see also H. Stachelin, "Die Entwicklung des Quellenkreises nach Pseudo Tertullian in Text und Untersuchungen, vi. 3; and the article, Gnosticism," 1901). A comparison of the surviving fragments of Basilden, moreover, with the outline of his system in Irenaeus-Hippolytus (Synptgama) shows that the account given by the Fathers of the Church is also in the highest degree untrustworthy. The principal and most characteristic points are not noticed by them. If we assume, as we must needs do, that the opinions which Basilden promulgates as the teaching of the "barbari" (Acta Archelai c. 55) were in fact his own, the fragments prove him to have been a decided dualist, and his teaching an interesting further development of oriental (Iranian) dualism. Entirely consistent with this is the information given by the Acta Archelai that Basilden, before he came to Alexandria, had appeared publicly among the Persians (fuit praedicator apud Persas); and the allusion to his having appeared to prophets with oriental names, Barkabbas and Barkoph (Agrippa in Eusebius Hist. Eccl. iv. § § 7). So too his son Isidorus explained the prophecies of a certain Paruch (Barkoph) and appealed to the supposed meaning of the Prophecies of Zoroaster, Stromat. vi. 6 § 53). Thus Basilden assumed the existence of two principles not derivable from each other: Light and Darkness. These had existed for a long time side by side, without knowing anything of each other, but when they perceived each other, the Light had only looked and then turned away; but the Darkness, seized with desire for the Light, had made itself master, not indeed of the Light itself, but only of its reflection (species, color). Thus they had been in a position to form this world: unde nec perfectum bonum est in hoc mundo, et quod est, vale est exiguus. This speculation is clearly a development of that which the Iranian cosmology has to tell about the battles between Ahura-Mazda and Angro-Mainyu (Ormuzd and Ahriman). The Iranian optimism has been replaced here by a strong pessimism. This material world is no longer, as in Zoroastrianism, essentially a creation of the good God, but the powers of evil have created it with the aid of some stolen portions of light. This is practically the transference of Iranian dualism to the more Greek antithesis of soul and body, spirit and matter (cf. Irenaeus. Acta Archelai c. 55, c. 61 c. 115; ") saeul starum super natum et corpus enim natura corruptibile existit."

The fundamental dualism of Basilden is confirmed also by one or two other passages. In the parable of the rich man and Lazarus, Basilden saw the proof of naturam sine rodice et sine loco recus superuemire (Acta Archelai). According to Clemens, Strom. iv. 12 § 83, &c., Basilden taught that even those who have not sinned in act, even Jesus himself, possess a sinful nature. It is possibly also in connexion with the dualism of his fundamental

views that he taught the transmigration of souls (Origen in Ep. ad Rom. lib. iv.; Opp. de la Riv. iv. 540; cf. Clemens, Excerpta ex Theodoto, § 28). Isidorus set up celibacy, though in a modified form, as the ideal of the perfect (Clemens, Strom. iii. i § 1, &c.). Clemens accuses Basilides of a deformation of the Devil (θεάδεω των δαίδων), and regards as his two dogs that of the Devil and that of the transmigration of souls (Strom. iv. 12 § 82; cf. v. i. § 75). It is remarkable too that Isidorus held the existence of two souls in man, a good and a bad (Clemens, Strom. ii. 20 113; with which may be compared the teaching of Mani about the two souls, which it is impossible to follow F. Ch. Baur in excluding, and also the teaching of the Pistis Sophia (translated by C. Schmidt, p. 183, &c.). According to Clemens (Strom. ii. 20 § 112), the followers of Basilides spoke of πνευματα τα προπορεμετα τη λογικη ψυχη κατα πνα ταραχον και σφιχτον άρχων: that is to say, here also is assumed an original confusion and intriguing. Epiphanius too tells us that the teaching of Basilides had its beginning in the question as to the origin of evil (Hae. xxiv. 6).

Now, of this sharply-defined dualism there is scarcely a trace in the system described by the Fathers of the Church. It is therefore only with caution that we can use them to supplement our knowledge of the true Basilides. The doctrine described by them that from the supreme God (the innatus pater) he had emanated 365 heavens with their spirits, answers originally to the astronomical conception of the heavens with their 365 daily aspects (Irenaeus i. 24. 7; Trecentorum autem sexaginta quinque caelorum locales positiones distribuunt similiter ut mathematici). When, therefore, the supreme God is called by the name ἄραραξας or ἄραραξες, which contains the numerical value 365, it is worthy of remark that the name of the Persian god Mithras (Melphasis) also was known in antiquity to contain this numerical value (Jerome in Amos 3; Opp. Vallarsi vi. i. 257). Speculations about the Perseo-Hellenistic Mithras appear to have been transferred to the Gnostic Abrazas. Further, if the Pater innatus be surrounded by a series of (from five to seven) Hypostases (according to Irenaeus i. 24. 3; Naos, Δόξα, Φρόνησις, Σοφία, Δίναμος; according to Clemens, Strom. iv. 23 § 164, Δικαιοσύνη and Ερήμη perhaps may be added), we are reminded of the Ameshas-spenta which surround Ahura-Mazda. Finally, in the system of Basilides, the (seven?) powers from whom this world originates are accepted as the lowest emanations of the supreme God. This conception which is repeated in nearly every Gnostic system, of (seven) world-creating angels, is a specifically oriental speculation. The seven powers which create and rule the world are without doubt the seven planetary deities of the later Babylonian religion. If, in the Gnostic systems, these become daemonic or semi-daemonic forces, this points to the fact that a stronger monotheistic religion (the Iranian) had gained the upper hand over the Babylonian, and had degraded its gods to daemons. The syncretism of the Babylonian and the Persian religion was also the nursing-ground of Gnosticism. When, then, Basilides identified the highest angel of the seven, the creator of the worlds, with the God of the Jews, this is a development of the idea which did not occur until late, possibly first in the specifically Christian circles of the Gnostics. We may note in this connexion that the system of Basilides ascribes the many battles and quarrels in the world to the privileged position given to his people by the God of the Jews.1

It is at this point that the idea of salvation is introduced into the system. The confusion in the world has meanwhile risen to such a pitch that the supreme God sends his Nous, who is also called Christ, into the world (Irenaeus i. 24. 4). According to Clemens, the Saviour is termed πνευμα δικαιονύμων (Strom. ii. 8 § 36) or δικαιον (Excerpta ex Theodoto, § 16). It is im-

1 The materials are in Baur, Das monachische Religionssystem (1831), p. 162, &c.

possible certainly to determine how Basilides conceived the relation of this Saviour to Jesus of Nazareth. Basilides himself (Strom. iv. 12 § 83) knows of an earthly Jesus and denies the principle of his sinlessness (see above). According to the account given by Irenaeus, the Saviour is said to have appeared only as a phantasus; according to the Excerpta ex Theodoto, 17, the Diakonos descended upon Jesus at his baptism in the form of a dove, for which reason the followers of Basilides celebrated the day of the baptism of Jesus, the day of the ἐνταφίαζε as a high festival (Clemens, Strom. i. 21 § 18). The various attempts at combination probably point to the fact that the purely mythical figure of a god-saviour (Héros) was connected first by Basilides with Jesus of Nazareth. As to what the conception of Basilides was of the completion of the process of redemption, the available sources tell us next to nothing. According to an allusion in Clemens, Strom. ii. § 36, with the mission of the Saviour begins the great separation of the sexes, the fulfilment and the restoration of all things. This agrees with the beginning of the speculation of Basilides. Salvation consists in this, that which was combined for evil is once more separated.

Among the later followers of Basilides, actual magic played a determining part. They hand down the names of the rulers of the several heavens as a weighty secret. This was a result of the belief, that whoever knew the names of these rulers would after death pass through all the heavens to the supreme God. In accordance with this, Christ also, in the opinion of these followers of Basilides, was in the possession of a mystic name (Caulacau = ἑλιότροπος Jes. xxviii. 10) by the power of which he had descended through all the heavens to earth, and had then again ascended to the Father. Redemption, accordingly, could be conceived as simply the revelation of mystic names. In this connexion the name Abraxas and the Abraxas gems must be remembered. Whether Basilides himself had already given this magic tendency to the teaching of his followers, that cannot be decided for us.

Basilides, then, represents that form of Gnosticism that is closest to Persian dualism in its final form. His doctrine is most closely related to that of Sattorlin (Saturninus). From most of the other Gnostic sects, with the exception perhaps of the Jewish-Christian Gnosticism, he is distinguished by the fact that he with the figure of the fallen female god (Sophia Achamoth), and, in general, the idea of a fall within the godhead is entirely wanting. So far as we can see, on the other hand, Basilides appears actually to represent a further development of Iranian dualism, which later produced the religious system of Mani.

Accounts of the teaching of Basilides are to be found in all the more complete works on Gnosticism (see bibliography to the article Gnosticism, and especially the extensive survey by W. Boer). The chief sources are best reproduced in Hilgenfeld, Ketzergeschichte des Urchristentums (1884), pp. 195-230. See also Krüger, article "Basilides," in Herzog-Hauck, Realencyklopädie, ed. 3. (W. Boer).

BASILISK (the βασίλισσα of the Greeks, and Tēphra (cockatrice) of the Hebrews), a name given by the ancients to a horrid monster of their own imagination, to which they attributed the most malignant powers and an equally fiendish appearance. The term is now applied, owing to a certain fanciful resemblance, to a genus of lizards belonging to the family Iguanidae, the species of which are characterized by the presence, in the males, of an erectile crest on the head, and a still higher, likewise erectile crest—best with scales—on the back, and another on the long tail. Basiliscus americanus reaches the length of one yard; its colour is green and brown, with dark crossbars, while the crest is reddish. This beautiful, strictly herbivorous creature is rather common amidst the luxuriant vegetation on the banks of rivers and streams of the Atlantic hot lands of Mexico and Guatemala. The lizards lie upon the branches of trees overhanging the water, into which they plunge at the slightest alarm. They then propel themselves by rapid strokes of the hind limbs, beating the water in a semi-erect position and letting the long slender-like tail drag behind. They are universally known as pasta-rios, i.e. fryermen.

BASIM, a town of India, in the Akola district, Berar, 52 m. S.S.E. from Akola station of the Great Indian Peninsula railway. Pop. (1901) 13,582. Until 1905 it was the headquarters of the district of Basim, which had an area of 2949 sq. m.; but in that
year the district was abolished, its component taluks being divided between the districts of Akola and Yeotmal. Its western portion, the Basin taluk, consists of a fertile tableland, about 1000 ft. above sea-level, sloping down westward and southward to the rich valley of the Penganga; its eastern portion, the taluks of Mangrol and Pusad, mainly of a succession of low hills covered with poor grass. In the Pasarl taluk, however, there are wide stretches of woodland, while some of the peaks rise to a height of 2000 ft., the scenery (especially during the rains) being very beautiful. The climate of the locality is better than that of the other districts of Berar; the hot wind which blows during the day in the summer months being succeeded at night by a cool breeze. The principal crops are millet, wheat, other food grains, pulse, oilseeds and cotton; there is some manufacture of cotton-cloth and blankets, and there are ginning factories in the town. In 1901 the population was 3,533,410, showing a decrease of 11½% in the decade, due to the famine of 1899-1900, which was severely felt in the district.

BASIN, THOMAS (1427-1591), bishop of Lisieux and historian, was born probably at Caudebec in Normandy, but owing to the devastation caused by the Hundred Years' War, his childhood was mainly spent in moving from one place to another. In 1444 he went to the university of Paris, where he became a master of arts in 1450, and afterwards studied law at Louvain and Pavia. To attain the council of Ferrara, and was soon made canon of the church at Rouen, professor of canon law in the new university of Caen and vicar-general for the bishop of Bayeux. In 1447 he became Bishop of Lisieux. He was much involved in the wars between the English and French and was employed by Charles VII. of France, and by his successor Louis XI., at whose request Basin drew up a memorandum setting forth the misery of the people and suggesting measures for alleviating their condition. In 1464 the bishop joined the league of the Public Weal, and fell into disfavour with the king, who seized the temporalities of his see. After exile in various places Basin proceeded to Rome and renounced his episcopal. At this time (1474) Pope Sixtus IV. bestowed upon him the title of archbishop of Caesarea. Occupied with his writings Basin then passed some years at Trier, and afterwards transferred his residence to Utrecht, where he died on the 3rd of December 1491. He was buried in the church of St John, Utrecht.

Basin's principal work is his Historiae de rebus a Carolo VII. et Ludovico XI. Francorum regibus coramque in tempore in Gallia gestis. This is of considerable historical value, and has been compared to the author's historical works of Louis XI. At the time it was regarded as the work of a priest of Liége, named Amelgard, but it is now practically certain that Basin was the writer. He also wrote a suggestion for reform in the administration of justice entitled Libellus de optimo ordine foresensibus lites auditendi et defereni; an Apologia, written to answer the charges brought against him by Louis XI.; a Brevis argumentum, or allegorical account of his own misfortunes; a Peregrinatio; a defence of Joan of Arc entitled Opinio et consilium super processu et condemnatione Johanne, dictae Puelle, and other miscellaneous writings. He wrote in French, Advis de Monseigneur de Lysieux au roi (Paris, 1677). See the edition of the Historiae, by J. E. J. Quicherat (Paris, 1853-1859); also G. du F. de Beaumont, Charles VII and Louis XI. d’après Thomas Basin (Paris, 1839).

BASIN, or Bason (the older form bacim is found in many of the Romanic languages, from the Late Lat. bacimus or bacchimus, probably derived from bacca, a bowl), a round vessel for holding liquids. Hence the term has various technical uses, as of a dock constructed with flood-gates in a tidal-river, or of a widening in a canal for unloading barges; also, in physical geography, of the drainage area of a river and its tributaries.

In geology, “basin” is equivalent to a broad shallow syncline, i.e. it is a structure proper to the bed rock of the district covered by the term; it must not be confused with the physiographic river basin, although it occasionally happens that the two coincide to some extent. Some of the better known geological basins in England are, the London basin, a shallow trough or syncline of Tertiary, Cretaceous and Jurassic rocks; the Hampshire basin, of similar formations; and the numerous coal basins, e.g. the S. Wales coalfield, the Forest of Dean, N. Staffordshire coalfield, &c. The Paris basin is made of strata similar to those in the London and Hampshire basins. Strictly speaking, a structural basin is formed of rock beds which exhibit a centroclinal dip; an elongated narrow syncline or trough is not a basin. “Rock-basins” are comparatively small, steep-sided depressions that have been scooped out of the solid rock in mountainous regions, mainly through the agency of glaciers (see Cirque). Lakes sometimes occupy basins that have been caused by the removal in solution of some of the more soluble constituents (rock salt, &c.) in the underlying strata; occasionally lake basins have been formed directly by crustal movements.

BASINET (a diminutive of “basin”), a form of helmet or headpiece. The original small basinet was a light open cap, with a peaked crown. This was used alternately to, and even in conjunction with, the large heavy heaume. But in the latter half of the 13th century the basinet was developed into a complete war head-dress and replaced the heaume. In this form it was larger and heavier, had a vizor (though not always a pivoted vizor like that of the later armet), and was connected with the gorget by a “camail” or mail hood, the head and neck thus being entirely covered. It is always to be recognized by the form of the gorget, which is generally a broad collar, “bascinet,” “bascinet,” “bacinet,” or “basset.” The form “bassinet” is used for the hooded wicker cradle or perambulator for babies.

BASINGSTOKE, a market-town and municipal borough of Hampshire, England, 48 m. W.S.W. from London by the London & South-Western railway; served also by a branch of the Great Western railway. Pop. (1901) 9793. The church of St Michael and All Angels is a fine specimen of a late Perpendicular building (principally of the time of Henry VIII.). The chapel of the Holy Ghost is a picturesque ruin, standing in an ancient cemetery, built for the use of the local gild of the Holy Ghost which was founded in 1525, but flourished for less than a century. Close to the neighbouring village of Old Basing are remains of Basing House, remarkable as the scene of the stubborn opposition of John, fifth marquess of Winchester, to Cromwell, by whom it was taken after a protracted siege in 1645. A castle occupied its site from Norman times. Numerous prehistoric relics have been discovered in the district, and a large circular encampment is seen at Winklebury Hill. Basingstoke has a large and busy trade, and breweries and the manufacture of agricultural implements, and of clothing are carried on. The Basingstoke canal, which connects the town with the river Wey and so with the Thames, was opened about 1794, but lost its trade owing to railway competition. It was offered for sale by auction unsuccessfully in 1904, but was bought in 1905. The municipal borough is under a mayor, four aldermen and twelve councillors. Area, 4105 acres.

Basingstoke is a town of great antiquity, and excavations have brought to light undoubted traces of Roman occupation. The first recorded historical event relating to the town is a victory won here by Ethelred and Alfred over the Danes in 871. According to the Domedown survey it had always been a royal manor, and comprised three mills and a market. A charter from Henry III. in 1256 granted to the men of Basingstoke the manor and hundred of that name and certain other privileges, which were confirmed by Edward III., Henry V. and Henry VI. As compensation for loss sustained by a serious fire, Richard II. in 1392 granted to the men of Basingstoke the rights of a corporation and a common seal. A charter from James I. dated 1612 entitled two hallways, fourteen capital burgesses, four justices of the peace, a high steward and under steward, two sergeants-at-mace and a court of record. Charles I. in 1641 changed the corporation to a mayor, seven aldermen and seven burgesses. Basingstoke returned two members to parliament in 1295, 1302 and 1306, but no writs are extant after this date. In 1202-1203 the market day was changed from Sunday to Monday, but in 1214 was transferred to Wednesday, and has not since been
changed. Henry VI. granted a fair at Whitson to be held near the chapel of the Holy Ghost. The charter from James I. confirmed a charter at the feast of St Michael the Archangel, and that of Charles I. granted two fairs on Basingstoke Down at Easter and on the 10th and 11th of September. The wool trade flourished in Basingstoke at an early date, but later appears to have declined, and in 1631 the clothiers of Basingstoke were complaining of the loss of trade and consequent distress.

See *Victoria County History—Hants: F. G. Baget and J. E. Millard, History of Basingstoke* (Basingstoke, 1886).

**BASIN-STAND**, a piece of furniture consisting of a small stand, usually supported on three legs, and most commonly made of mahogany or rosewood, for holding a wash-hand basin. The smaller varieties were used for rose-water ablutions, or for the operation of hair-powdering. The larger ones, which possessed sockets for soap-dishes, were the predecessors of the ample modern wash-hand stand. Both varieties, often of very elegant form, were in extensive use throughout a large part of the 18th century.

**BASKERVILLE, JOHN** (1706–1775), English printer, was born at Wolverley in Worcestershire on the 28th of January 1706. About 1726 he became a writing master at Birmingham, and he seems to have had a great talent for calligraphy and for cutting inscriptions in stone. While at Birmingham he made some important improvements in the process of japanning, and gained a considerable fortune. About the year 1750 he began to make experiments in type-founding, producing types much superior in distinctness and elegance to any that had hitherto been employed. He set up a printing-house, and in 1757 published his first work, a *Virgil* in royal quarto, followed, in 1759, by his famous edition of Milton. In that year he was appointed printer to the university of Cambridge, and undertook editions of the Bible and the Book of Common Prayer. The *Horace*, published in 1762, is distinguished even among the productions of the Baskerville press for its correctness and for the beauty of the paper and type. A second *Horace* appeared in 1770 in quarto, and its success encouraged Baskerville to publish a series of quarto editions of Latin authors, which included Catullus, Tibullus, Propertius, Lucretius, Terence, Sallust and Florus. This list of books issued by Baskerville from his press lends some illogicality to the challenge that he was a person of no education. These books are admirable specimens of typography, and Baskerville is deservedly ranked among the foremost of those who have advanced the art of printing. His contemporaries asserted that his books owed more to the quality of the paper and ink than to the type itself, but the difficulty in obtaining specimens from the Baskerville press shows the estimation in which they are now held. His wife, Sarah Baskerville, carried on the business for some time after his death, which took place on the 8th of January 1775.

**BASKET**, a vessel made of twigs, cane or rushes, as well as of a variety of other materials, interwoven together, and used for holding, protecting or carrying any commodity. The process of interweaving twigs, rushes or leaves, is practised among the rudest nations of the world; and as it is one of the most universal of arts, so also does it rank among the most ancient industries, being probably the origin of all the textile arts of the world. Decorative designs in old ceramic ware are derived from the marks left by the basket mould used before the invention of the potter's wheel, and in the willow pattern on old china, and the basket capitals or mouldings of Byzantine architecture, the influence of the basketmaker's art is clearly traceable. Essentially a primitive craft, its relative importance is in inverse ratio to the industrial development of a people.

The word "basket" has been generally identified with the Latin *bascuda*, as in Martial (xiv. 99):

> "Barbara de pictis veni bascuda Britannias; Sed me amavlt dicere Roma suam."

But its etymology is unknown, and the *New English Dictionary* states that there is no evidence to connect basket with *bascuda*, which denotes rather a tub, tray or brazier vessel.

Among many uncivilized tribes, baskets of a superior order are made and applied to various useful purposes. The North American Indians prepare strong water-tight *wattle* baskets from the roots of a species of *abies*, and these they frequently adorn with very pretty patterns made from the dyed quilts of their native porcupine, *Erethizon dorsatum*. Wealthy Americans have formed collections of the beautiful ware treasured as heirlooms in Indian families, and large prices have been paid for baskets made by the few squaws who have inherited the traditions and practice of the art, as much as £1,000,000 were recently drawn from California and Arizona within two years. The Indians of South America weave baskets equally useful from the roots of the Carnahubs and other palms. The Kaffirs and Hottentots of South Africa are similarly skillful in making the Ilala reed and the roots of plants; while the Abyssinians of the market of the Central Africa display great dexterity in the art of basket-weaving.

Basket-making, however, has by no means been confined to the fabrication of those simple and useful utensils from which its name is derived. Of old, the shields of soldiers were fashioned of wicker-work, either plain or covered with hides. Xenophon, in his story of the Thirty Tyrants at Athens, relates that the exiled Greeks who had seized on the Peiraeus made themselves shields of whitened osiers; and similar weapons of defence are still constructed by modern savages. The huts of the earliest settlers in Rome and in western Europe generally were made of osier work plastered with clay. Some interesting remains of British dwellings of this nature found near Lewes in 1877 were described by Major-General H. L. F. Pitt-Rivers in *Archaeologia*, vol. lxi., pp. 436–458. Boats of the same material, covered with the skins of animals, attracted the notice of the Romans in Britain; they seem to have been of the ordinary boat-shape. The basket-work boats mentioned by Herodotus as being used on the Tigris and Euphrates were round and covered with bitumen. Boats of this shape are still used on these rivers, and boats of analogous construction are employed in crossing the rivers of India, in which the current is not rapid. Nor have methods of making much changed. The strokes employed in the construction of basket-work found in Etruscan tombs and now exhibited in the Museo Etrusco at Florence, and in similar articles discovered in Egyptian tombs, are the same as those used by the English basket-maker to-day. General Pitt-Rivers, on comparing the remains excavated near Lewes with a modern hamper in his possession, found the method to be identical.

Since about the middle of the 19th century the character of basket-work in England has been greatly modified. The old English cradle, reticule, and other small domestic wares, have been driven out of the market by goods made on the continent of Europe, and the coarse brown osier packing and hampers have been largely superseded by rough casks and cases made from cheap imported timber. This loss has, however, been more than counterbalanced by the production of work of a higher class, such as finely made chairs, tables, lounges and other articles of furniture; luncheon and tea-baskets, and similar requisites of travel. In addition to the foregoing the chief categories of English manufacture are: vegetable and fruit baskets, transit and travelling hampers, laundry and linen baskets, partition baskets for wine, and protective wicker cases for fragile ware such as glass carboys, stone and other bottles. Wicker shields or cases made from cane pit, for the protection of shells, have been introduced by the English military authorities. Some evidence of the above-mentioned developments is afforded by a comparison of the wages lists of the London Union of Journeymen Basketmakers issued in 1865 and in 1866. The former consists of 87 printed pages; the latter of 144 pages, and these more closely set.

No machinery is used in basket-making. A considerable training and natural aptitude go to form the expert workman, for the ultimate perfection of shape and beauty of texture depend upon the more or less perfect conception of form in the
BASKET

craftsman's mind and on his power to impress it on a recalcitrant material. In England at least, he rarely uses a mould; every stroke made has a permanent effect on the symmetry of the whole work and no subsequent pressure will alter it. Wages in London vary from 2s. to 5s. per week according to aptitude. The Basketmakers' Company is one of the oldest craft gilds of the city of London and still exists.

Employment is given by the London Association for the Welfare of the Blind to a number of partially or wholly blind workpeople, who are engaged in the making of some of the coarser kinds of baskets; but the work, which bears obvious traces of its origin, is not commercially remunerative, and the association depends for partial support on the contributions of the charitable, and on supplementary sales of fine or fancy work produced under ordinary conditions and largely imported. Similar associations exist in some English provincial towns, in Edinburgh, in Dublin and Belfast, and in certain European cities.

The materials which are actually employed in the construction of basket-work are numerous and varied, but it is from certain species of willow that the largest supply of basket-making materials are obtained. Willow for basket-work are extensively grown on the continent of Europe, whence large quantities are exported to Great Britain and the United States; but no rods surpass those of English growth for their tough and leathery texture, and the finest of basket-making willows are now cultivated in England—in Leicestershire, Nottinghamshire and the valleys of the Thames and the Trent. In the early part of the 19th century, considerable attention was given in Britain to the cultivation of willows suitable for basket-making, and the industry was first stimulated by premiums offered by the Society of Arts. Mr William Scaling of Basford, Notts, was a most successful grower and published some admirable pamphlets on the cultivation of willows. The most extensive English willow plantation or salicetum (Lat. salix, willow) of the present day is that planted by Mr W. P. Eilmore at Thurmanston near Leicester, and consists of about 100 acres of the finest qualities. Mr Eilmore, a practical basket-maker, successfully introduced some valuable continental varieties (see Osier).

Willows are roughly classed by the basket-maker into "osier" and "fine." The former consists of varieties of the true osier, Salix viminalis; the latter of varieties of Salix triandra, S. purpurea and some other species and hybrids of tougher texture. For the coarsest work, dried unpeeled osiers, known as "brown stuff," are used; for finer work, "white (peeled) stuff" and "buff" (willows stained a tawny hue by boiling them previous to peeling). Brown stuff is sorted, before it reaches the workman, into lengths varying from 3½ to 8 or 10 ft., the smallest being known in London and the home counties as "alu," the largest as "great," and the intermediate sizes as "long small," "threepenny" and "middleboro." White and buff rods are more carefully sorted, the smallest, about 2½ ft. or less, being known as "small tack," and rising sizes as "tack," "short small," "small," "long small," "threepenny," "middleboro," and "great." Rods of two to three years' growth, known as "sticks," are used for strengthening the framework of the bottom and of square work. In every case except the last, the stuff is soaked in tanks to render it pliable before use—brown from three to seven days, white and buff from half-an-hour to half a day. The rods are used whole for ordinary work, but for baskets of slight and finer texture each is divided into "skains" of different degrees of size. "Skains" are osiers cleft into three or four parts, by means of an implement called a "cleaver," which is a wedge-shaped tool of boxwood inserted at the point or top end of the rod and run down through its entire length. They are next drawn through an implement resembling the common spokeshake, keeping the grain of the split next the iron or stock of the shave, while the pith is presented to the steel edge of the instrument, and in order to bring the split into a shape still more regular, it is passed through another implement called an upright, consisting of a flat piece of steel, each end of which is fashioned into a cutting edge, like that of an ordinary chisel and adjusted to the required width by means of a thumbscrew.

The tools required by a basket-maker are few and simple. They consist, besides the foregoing, of a shop-knife for cutting out material; a picking knife for cutting off the protruding butts and tops of the rods after the work is completed; two or three bodkins of varying sizes; a flat piece of iron somewhat narrowly triangular in shape for driving the work closely together; a stout pair of shears and a "dog" or "commander" for straightening sticks. The employer supplies a screw block or vice for gripping the bottom and cover sticks of square work, and a lapboard on which the workman fixes the upsetted bottom while siding up the basket. This is the full kit. A common round or oval basket may, however, be made with no other tools than a shop-knife and a bodkin. On the continent of Europe shapes or blocks are in use on which the fabric is in some cases woven.

The technicalities of basket-making may be easily followed by a glance at the illustration here reproduced by the courtesy of the Society of Arts. It will be seen that the "bye-stakes" are merely inserted in the "upsets," whereas the stakes are driven in at each side of the "bottom-sticks" and pricked up to form the rigid framework of the side. When the "bottom-stick" and "stake" are formed of one and the same continuous rod, it is termed a "league." If the bottom is made on a hoop the butts of the stakes are slipped, "i.e." cut away with a long cut of the shop-knife, and turned tightly round the hoop; they are then said to be "scalced" on. The chief strokes used in constructing an ordinary basket are:—the "slew"—two or more rods woven together; the "rand," rods woven in singly; the "fitch," two rods tightly worked alternately one under the other, employed for skeleton work such as cages and waste-paper baskets; the "pair," two rods worked alternately one over the other, used for filling up bottoms and covers of round and oval baskets; and the "wale," three or more rods worked alternately, forming a string or binding course. Various forms of plaiting, roping and tracking are used for bordering off or finishing.

An ordinary oval basket is made by preparing the requisite number of bottom sticks, preserving their length greater than the required width of the bottom. They are ranged in pairs on the floor parallel to each other at small intervals, in the direction of the longer diameter of the basket, thus forming what may be called the "woof," for basket-work is literally a web. These parallel rods are then crossed at right angles by two pairs of the largest osiers, on the butt ends of which the workman places his feet; and they are confined in their places by being each woven alternately over and under the parallel pieces first laid down and their own butts which form the end bottom sticks. The whole now forms what is technically called the "slath," which is the foundation of the basket. Next other rods are taken and

1 See the report of a paper by T. Okey, published in the Journal of the Society of Arts, January 11th, 1907.
woven under and over the sticks all round the bottom until it be of sufficient size, and the woof be occupied by them. Thus the bottom or foundation, on which the superstructure is to be raised is finished. This latter part is accomplished by sharpening the large ends of as many long and stout osiers as may be necessary to form the stakes or skeleton. These are forced between the bottom sticks from the edge towards the centre, and are turned up or "upset" in the direction of the sides; then other rods are woven in and out between each of them, until the basket is raised to the intended height, or, more correctly speaking, the depth it is to receive. The edge or border is finished by turning down the ends of the stakes, now standing up, behind and in front of each other, whereby the whole is firmly and compactly united, and it is technically known as the "belly." A lid is constructed on the same plan as that of the bottom, and tied on with hinges formed of twisted rods; simple handles may be made by inserting similar rods by the sides of two opposite stakes and looping them under the border to form rope-like bands. This is the simplest kind of basket, from which others differ only in being made with finer materials and in being more nicely executed; but in these there is considerable scope for taste and fancy, and articles are produced of extreme neatness and ingenuity in construction.

In addition to willows many other materials are employed in the fabrication of wicker-work. Among the more important of these is the stem of *Calamus viminalis* or another allied species—the cane or rattan of commerce—which is used whole or made into skains. Since 1880 the central pith of this material, known as "cane-pulp" or "cane-pith," has been largely used in Great Britain and on the continent of Europe in the manufacture of furniture and other finer classes of work. About the same period plaited rush and straw, often coloured, came into use together with enamelled skains of cane. It must be admitted, however, that basket-work in these developments has encroached somewhat on the domain of cabinet-making; for wood and nails are now much used in constructing basket-work chairs, tables and other furniture.

With splits of various species of bamboo the Japanese and Chinese manufacture baskets of unequalled beauty and finish. The bamboo wicker-work with which the Japanese sometimes enlace their delicate egg-shell porcelain is a marvellous example of manipulation, and they and the Chinese excel in the application of bamboo wicker-work to furniture. In India "Cajan" baskets are extensively made from the fronds of the Palmry palm, *Borassus flabeliformis*, and this manufacture has been established in the Black Forest of Germany, where it is now an important and characteristic staple. Among the other materials may be enumerated the oodorous roots of the khus-khus grass, *Antherium mucicatum*, and the leaves of various species of screw pine, used in India and the East generally. Fronds of the palm of the Seychelles, *Lodoicea sechellarum*, are used for very delicate basket-work in those islands. Strips of the New Zealand flax plant, *Phormium tenax*, are made into baskets in New Zealand. Esparto fibre is used in Spain and Algeria for rude fruit baskets. Various species of *Maranta* yield basket materials in the West Indies and South America; and the *Tivie*, a species of *Calathoe*, a member of the order *Zingiberaceae*, is also employed similarly in Trinidad. Baskets are also frequently made from straw, from various sedges (*Cyperus*), and from shavings and splints of many kinds of wood.

The chief centres of English basket manufacture outside London are Thurston near Leicester, Basford near Nottingham, and Grantham. Large but decreasing quantities of light basket-work are made for the English market in Verdun, in the department of the Aisne, and in other parts of France; and great quantities of fancy and other work are produced in Belgium, in the Netherlands and in Germany, notably at Lichtenthal in Bavaria, at Sonnefel in Saxony and in the Black Forest.

The import and export values of baskets and basketware, and of willows and rods for basket-making, are enumerated in the Board of Trade returns for the United Kingdom since 1900, in which year basket-ware from foreign countries was imported to the value of £239,402. In 1901 the imports increased to £264,183; then they declined to £227,070 in 1905. The main sources of supply are shown in this comparison of 1900 and 1905:

<table>
<thead>
<tr>

<td>8,310</td>
<td>25,536</td>
</tr>
<tr>
<td>Japan</td>
<td>5,066</td>
<td>3,971</td>
</tr>
</tbody>
</table>

The increase from Japan (for 1904 the value was £52,372) and the decrease from France are remarkable.

Total export values of foreign baskets increased from £52,219 in 1900 to £62,286 in 1905, the most important exporting countries being—

Small British re-exports of willows (£1808 in 1900 and £571 in 1905) and baskets (£3785 in 1900 and £653 in 1905) to foreign parts and British possessions are tabulated. No particulars of exports of British produce and manufacture are specified in the returns.

**BASKET-BALL**, a game adapted to the open air, but usually played upon the floor of a gymnasium and in the cold season. It was the invention, in 1891, of James Naismith, an instructor in the gymnasium of the Young Men's Christian Association training-school at Springfield, Massachusetts. A demand had arisen for a game for the gymnasium class, which would break the monotony and take the place, during the winter months, of football and baseball, and which was not too rough to be played indoors. The idea of the game was first published in the *Triangle*, the school paper. It soon became one of the most popular indoor games of America, for girls as well as for men, and spread to England and elsewhere.

Basket-ball is played on a marked-off space 60 ft. by 40 ft. in extent, though in the open air the dimensions may be greater. In the middle of each short side and 10 ft. above the floor or ground, is placed a basket consisting of a net suspended from a metal ring 18 in. in diameter, backed, at a distance of 6 in., by a back-board 6 ft. long and 4 ft. high. The object of the game is to propel an inflated, leather-covered ball, 30 in. in circumference, into the opponents' basket, which is the goal, by striking it with the open hands. The side wins that scores most goals during two periods of play divided by an interval of rest. Although there is practically no limit to the number of players on each side, all indoor matches are played by teams of five, in positions opposing one another as in lacrosse, centre, right and left forwards and right and left guards (or backs). A referee has the general supervision of the game and decides when goals have been properly scored, and an umpire watches for infringements of the rules, which constitute *fouls*. There are also a scorer and timekeeper.

The game is started with the two opposing centres standing within a 4-foot ring in the middle of the floor. The referee puts the ball in play by tossing it into the air over the heads of the centres, who jump into the air for its possession or endeavour to bat it towards the opposing goal. From this moment the ball is in play until it falls into a basket, or passes the boundary-lines, or a foul is made. After a goal has been scored, the ball is again put in play by the referee in the centre. Should it be thrown across the boundary, a player of the opposing side, standing on the line at the point where the ball went over, puts it in play by passing or throwing it to one of his own side in any direction, there being no off-side rule—analogous to that in football. His opponents, of course, try to prevent the pass or intercept the throw, thus securing the ball themselves. When a foul has been called, a player of the opposing side is allowed a "free throw" for his opponents' basket from a mark 15 ft. distant from it and without interference. A goal scored from a
free throw counts one point; one scored while the ball is in play counts two. Hacking, striking, holding and kicking are foul, but a player may interfere with an opponent who has the ball so long as he uses one arm only and does not hit. A player must throw the ball from where he gets it, no running with it being allowed except when continuously bounding it on the floor. Basket-ball is an ancient and fast game and admits of a high degree of combination or team-play. The principal qualifications of a good player are quickness of movement and of judgment, coolness, endurance, accuracy and self-control. Good dodging, throwing, passing and team-play are the important requisites of the game, which is looked upon as excellent winter training for outdoor games. Basket-ball, with somewhat modified rules, is extremely popular with young women. 

See Spalding's Basket-Ball Guide; and George T. Hebrton, How to Play Basket-Ball; and Spalding's Basket-Ball Guide for Women.

BASNAGE, JACQUES (1653-1723), French Protestant divine, was the eldest son of the eminent lawyer Henri Basnage, sieur de Franquey, (1615-1693), and was born at Rouen in Normandy in 1653. He studied classical languages at Saumur and afterwards theology at Geneva. He was pastor at Rouen (his native place) from 1676 till 1685, when, on the revocation of the Edict of Nantes, he lost the leave of the king to retire to Holland. He settled at Rotterdam but in 1691 he returned to France. He was afterwards given the title of pastor of the Walloon church. In 1699 the grand pensionary A. Heinsius (1641-1702) secured his election as one of the pastors of the Walloon church at the Hague, intending to employ him mainly in civil affairs. Accordingly he was engaged in a secret negotiation with Marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht—a service which he executed with so much success that he was entrusted with several important commissions, all of which he discharged with great ability. In 1716 Dubois, who was at the Hague at the instance of the regent Orleans, for the purpose of negotiating the Triple Alliance between France, Great Britain and Holland, sought the advice of Basnage, who, in spite of the fact that he had failed to receive permission to return to France on a short visit the year before, did his best to further the negotiations. The French government also turned to him for help in view of the threatened rising in the Cevennes. Basnage had welcomed the revival of the Protestant church due to the zeal of Antoine Court; but he assured the regent that no danger of sedition could arise, for he knew that the principles of Calvin, he denounced the rebellion of the Camisards (1695) in his Instructions pastorales aux Réformés de France sur l'obédience due aux souverains (Paris, 1720), which was printed by order of the court and scattered broadcast in the south of France. Basnage died on the 22nd of September 1723.

Basnage was a good preacher and a prolific writer. His works include several dogmatic and polemical treatises, but the most important are the historical. Of these may be mentioned Histoire de la religion des églises réformées (Rotterdam, 1690), the Histoire de l'église depuis Jésus-Christ jusqu'à présent (ib. 1699)—both of them written from the point of view of Protestant polemics—and, of greater scientific value, the Histoire des Juifs (Rotterdam, 1706, Eng. trans. 1708) and the Antiquités judaïques ou remarques critiques sur la république des Hébreux (1713). He also wrote short explanatory introductions and notes to a collection of copper-plate engravings, much valued by connoisseurs, called Histoires du Vieux et du Nouveau Testament, représentées par des figures gravées en taille-douce par K. de Heus (1706). BASOCHÉ, or BASOCHE, with the analogous forms BASOQUE, BASOQUE et BAZOUCES; from the Lat. basilica, in the sense of law courts, a French gild of clerks, from among whom legal representatives (procureurs) were recruited. This gild was very ancient, even older than the gild of the procureurs, with which it was often at variance. It dated, no doubt, from the time when the profession of procureur (procurator, advocate or legal representative) was still free in the sense that persons rendering that service to others when so permitted by the law were not yet public and ministerial officers. For this purpose there was established near each important judicial centre a group of clerks, that is to say, of men skilled in law (or reputed to be so), who at first would probably fill in differently the roles of representative or advocate. Such was the origin of the Basoche of the parlement of Paris; which naturally formed itself into a gild, like other professions and trades in the middle ages. But this organization eventually became disintegrated, dividing up into more specialized bodies: that of the advocates, whose history then begins; and that of legal representatives, whose profession was regularized in 1344, and speedily became a saleable charge. The remnant of the original clerks constituted the new Basoche, which thenceforward consisted only of those who worked as clerks for the procureurs, the richer ones among them aspiring themselves to attain the position of procureur. They all, however, retained some traces of their original conditions. They are admitted to officiate in important cases in preference to other clerks and to their exclusion. From its ancient past the Basoche had also preserved certain picturesque forms and names. It was called the "kingdom of the Basoche," or, more correctly, the "structure of the procureurs," a name which was speedily adopted in general assembly, to the end of the 16th century, by order, it is said, of Henry III., and was thenceforth called the "chancellor." The Basoche had besides its maîtres des requêtes, a grand court-crier, a referralady, an advocate-general, a procureur général, a chaplain, &c. In early days, and until the first half of the 16th century, it was organized in companies in a military manner and held periodical reviews or parades (montres), sometimes taking up arms in the king's service in time of war. Of this there survived later only an annual cavalcade, when the members of the Basoche went to the royal forest of Bondy to cut the maypole, which they afterwards set up in the court-yard of the Palais. We hear also of satirical and literary entertainments given by clerks of the Palais de Justice, and of the moralities played by them in public, which form an important element in the history of the national theatre; but at the end of the 16th century these performances were restricted to the great hall of the Palais.

To the last the Basoche retained two principal prerogatives. (1) In order to be recognized as a qualified procureur it was necessary to have gone through one's "stage" in the Basoche and have been entered by name for ten years on its register. It was not sufficient to have been merely clerk to a procureur during the period and to have been registered at his office. This rule was the occasion of frequent conflicts during the 17th and 18th centuries between the members of the Basoche and the procureurs, and on the whole, despite certain decisions favouring the latter, the parlement maintained the rights of the Basoche. Opinion was favourable to it because the certificats de complaisance issued by the procureurs were dreaded. These certificats held good, moreover, in places where there was no Basoche. (2) The Basoche had judiciary powers recognized by the law. It had disciplinary jurisdiction over its members and decided personal actions in civil law brought by one clerk against another or by an outsider against a clerk. The judgment, at any rate if delivered by a maître des requêtes, was authoritative, and could only be contested by a civil petition before the ancient council of the Basoche. The Châtelet of Paris had its special basoche, which claimed to be older even than that of the Palais de Justice, and through which there was contentiously always a battle. The clerks of the procureurs at the cour des comptes of Paris had their own Basoche of great antiquity, called the "empire de Galilée." The Basoche of the Palais de Justice had in its ancient days the right to create provostships in localities within the jurisdiction of the parlement of Paris, and thus there sprang up a certain number of local basoche. Others were independent in origin; among such being the "regency" of Rouen and the Basoche of the parlement of Toulouse.

1 A procedure for obtaining a provisional judgment on urgent cases.

**BASQUE PROVINCES** (Provincias Vascongadas), a division of north-eastern Spain, comprising the three provinces of Álava, Biscay or Vizcaya and Guipúzcoa. Pop. (1909) 603,506; area 2,730 sq. m., the third in density in Spain. The territory occupied by the Basque Provinces forms a triangle bounded on the west and south by the provinces of Santander, Burgos and Logroño, on the east by Navarre, on the north by France and the Bay of Biscay. The French Pays Basque forms part of the arrondissements of Bayonne and Mauléon. For an account of the people, their origin, customs and language, see BASQUES. Of the Provinces, Guipúzcoa is the only one which is wholly Basque. Álava is the least so. Its capital, Vitoria, is said to have been founded by the Gothic king Leovigild (581). Older than these divisions, the date of which is uncertain, the ancient limits of the dioceses of Pamplona, Bayonne and Calahorra, probably corresponded more nearly to the boundaries of the ancient tribes, the Autrigones, the Caristi, the Varduli and the Vascones, with their still differing dialects, than to these civil provinces.

Leaving aside the legendary and uncertain portion of their history, we find the Provinces in some districts dependent allies of Navarre, in others of Castile. In Biscay the counts of Haro were the leaders of the Autrigones and Caristi and for some time were united with Castile under Pedro the Cruel, but the definitive union did not take place till 1370. In Álava the ruling power was the comenda of Arriaga (so called after its meeting place), which united the province to the crown of Castile in 1332. Guipúzcoa, which had been dependent sometimes on Navarre, sometimes on Castile, was definitively united to Castile in 1200. From the year 1425 the provinces were desolated by party wars among the lesser nobles (parientes mayores) but these came to an end in 1460–1498, when Henry IV. and Ferdinand—the Catholic strengthened the power of the towns and forbade the erection of any fortified house in the country. Though the three Basque Provinces were thus united to the crown of Spain, they still remained a land apart (tierra apartada). Their juntas acted to some extent in common; and although no written federal pact is known to have existed, they employed, as the symbol of their unity, a seal with the word Irurzabal, "The Three One," engraved upon it. They preserved their own laws, customs, fueros (see BASQUES), which the Spanish kings swore to observe and maintain. Unless countersigned by the juntas the decrees of Castile and Spanish legislation did not affect them in the provinces. In the junta of 1481 Guipúzcoa alone proposed a treaty of friendship, peace and free trade for ten years with England, and this was signed in Westminster, on the 9th of March 1482 (see Rymer, Foedera). The Basques still made their own treaties with England and France and are mentioned apart from Spain in the treaty of Utrecht (1713). They still preserved in their municipal institutions the old style of republics derived from the civitates and respublicae of ancient Rome. This kind of independence and autonomy lasted unchallenged until the death of Ferdinand VII. in 1833, when, in default of male heirs, his brother Don Carlos claimed the throne, confirmed the Basque fueros, and raised the standard of revolt against his niece, Isabel II. A seven years' war followed, in which an English legion under Sir George de Lacy Evans and a naval force under Lord John Hay took part. It was ended by the Convenio de Vergara (August 31st, 1839) in which the concession and modification of the fueros was demanded. The troubled period which followed the expulsion of Isabel II. in 1868 gave opportunity for a second Carlist war from 1872 to 1876. This ended, unlike the former one, in the utter defeat of the Carlist forces, and left the Provinces at the mercy of the government, without terms or agreement. In general government and legislation the Provinces were then assimilated to the rest of the nation. After 1876, the Provincial parliaments (diputaciones) were elected like the other provincial councils of Spain, deprived of many privileges and subjected to the ordinary interference of the civil governors. But their representatives, assisted by the senators and deputies of the Basque Provinces in the Cortes, negotiated successive pacts, each lasting several years, securing for the three Provinces their municipal and local self-government, and the assessment, distribution and collection of the principal taxes and octroi duties, on the understanding that an increased share should be paid annually to the state, subject to an increase whenever the national taxation of other provinces was augmented. In December 1906, after long discussion, the contribution of the Basque Provinces to the state, according to the law of the 21st of July 1876, was fixed for the next twenty years; for the first ten years at 8,500,000 pesetas, for the next ten an additional 500,000 pesetas, from 31st December 1916 to 31st December 1926, the province of Guipúzcoa paying in addition 700,000 pesetas to the treasury. These pacts have hitherto been scrupulously observed, and as the local authorities levy the contribution after their own local customs, landed property and the industrial and commercial classes are less heavily taxed in these territories than in the rest of Spain. Enough is raised, however, besides the amount handed over to the government, to enable the schools, roads, harbours and public works of every kind to be maintained at a standard which compares very favourably with other parts of Spain. When the three provinces sent in their first contingent of conscripts in 1878, it was found that all but about sixty knew how to read and write, and succeeding contingents have kept up this high standard.

In agriculture the Basque Provinces and the Pays Basque were great cider counties, but during the 19th century this was gradually replaced by wine-growing. The chief industries of the Basque Provinces are the sea fisheries and iron mining. Some of the mines round Bilbao have been worked from pre-historic times. In 1905 the Basque Provinces produced 5,302,344 tons of iron, over five millions of which came from Biscay, out of a total of 9,395,314 tons for the whole of Spain. More than the half of this total 5,843,953 tons, was exported to England. The swords of Mondragon in Guipúzcoa were renowned before those of Toledo. Eibar in the same province has long been a small-arm factories. There in the 19th century Señor Zuloaga successfully revivified the artistic inlaying of gold and silver in steel and iron.

**BIBLIOGRAPHY.**—Of older works, though often uncritical, R. P. Henestrosa, Aperiocicnic de las Antiguitudes de Cantabria (Salamanca, 1688), is still valuable. It contains estimates of the population, the manners and customs of the people, Coorgafia de Guipúzcoa, by R. P. M. de Larramendi, S. J., is indispensable. Written about 1750, it was first printed in Barcelona in 1882 (later edition, San Sebastian, 1896). It contains an excellent account of the local customs in the Basque Province. D. Larramendi, Introduccion a la Historia Natural, y a la Geografia Fisica de España, by D. Guillermo Bowles (Madrid, 1775). El Guipuzcoano instruido (San Sebastian, 1780), in the form of a dictionary, gives full details of the life, the rights, duties and obligations of a Basque citizen of that date. The Diccionario Geografico-Histórico de España, tome i., ii. El Reyno de Navarra Senorio de Vizcaya y Provincias de Álava y Guipúzcoa (Madrid, 1802), is full of local information, but with a strong bias in favour of the central government. The best works on the various editions of the fueros are Historia de la Legislacion civil de España, by A. Marichalar, Marques de Montesa, and Cayetano Manrique: Fueros de Navarra Vizcaya, Guipúzcoa y Álava, Madrid, (ed. 1868); and the Noticia de las cosas memorables de Guipúzcoa, by D. Pablo de Gorosabel (Tolosa, 1890–1901), the best account of the fueros of the which of C. de Echegaray, gives the legislative acts down to May 1900. Las Provincias Vascongadas a Fines de la Edad Media, by C. de Echegaray (Sebastián, 1895), is excellent. There is a Historia de Biscaya, by Dr. F. de Labayu, and a Contenido de the same by Fermín Herran (Bilbao, 1903). D. Carmelo de Eche- garay, Cronista de las Provincias Vascongadas, with his colleagues D. Serapio Múgica, F. Soraluce, and other historians, has extended the study of the Basques, and has gathered together all the municipal archives of all the Basque towns, without which no true history can be written. Several discoveries of important missing documents and MSS. were thus made. The development of the Basque mining industry is fully recorded in Las Minas de hierro de la provincia de Vizcaya, by M. Pérez Fabre,贤士 progressos realizados en esta region desde 1870 hasta 1890 (Bilbao, 1900).

**BASQUES,** a people inhabiting the three Basque Provinces—Biscay, Álava and Guipúzcoa—and Navarre in Spain, and the arrondissement of Bayonne and Mauléon in France. The number of those who can be considered in any sense pure Basques is
BASQUES

probably about 600,000 in Europe, with perhaps 100,000 emigrants in the Americas, chiefly in the region of La Plata in South America. The word Basques is historically derived from Vascones, which, written Vascos, has also given the name Gascons to a very different race. The Basques call themselves Euskaldunak, i.e., "those who possess the Eskuara," and their country Euskal-Herria.

Language.—The original and proper name of the language is Eskuara (euskara, uskara), a word the exact meaning of which has not yet been ascertained, but which probably corresponds with the idea "clearly speaking." The language is highly interesting and stands as yet absolutely isolated from the other tongues of Europe, though from the purely grammatical point of view it recalls the Magyar and Finnic languages. It is an agglutinative, incorporating and polysynthetic system of speech; in the general series of organized linguistic families it would take an intermediate place between the American on the one side and the Ugro-Altaic or Ugrian on the other.

Basque has no graphic system of its own and uses the Roman character, either Spanish or French; a few particular sounds are indicated in modern writings by dotted or accented letters. The alphabet would vary according to the dialects. Prince L. L. Bonaparte, who is the best informed scholar on all the Basque dialects, has invented a whole, thirteen simple vowels, thirty-eight consonants and four diphthongs. Nasal vowels are found in some dialects as well as "wet" consonants—ty, dy, ny, &c. The doubling of consonants is not allowed and in actual current speech most of the soft consonants are dropped. The letter r cannot begin a word, so that rationem is written in Basque arrazoin.

Declension is replaced by a highly developed postpositional system; first, the definite article itself a (plural ak) is a postposition—saldì, "horse," soldia "the horse," soldiak, "the horses." The declensional suffixes or postpositions, which, just as our prepositions, may be added to one another, are postponed to the article when the noun is definite. The principal suffixes are k, the mark of the plural, and of the singular nominative agent; n, "of" and "in"; i, "to"; z, "by"; ik, "some"; ko, "from," of (Lat. a); tik, "from" (Lat. a); tut, kotsat, nake, "for"; kin, gas, "with"; gaitik, "for the sake of"; gana, "towards"; ra, rai, "to," into," at. &c. Of these suffixes some are joined to the definite, others to the indefinite noun, or even to both.

The Basque conjugations, which to a superficial observer appear closer related to those of the Semitic or Hamitic languages, are ni, "I;" ki, "they;" gu, "we;" zu, "you" in modern times, zu has become a polite form of "thou," and a true plural "you" (i.e. more than one) has been formed by suffixing the pluralizing sign k—such. The pronouns of the third person are more demonstratives. There are three: kura or kura, "that;" hau or kau, "this;" ori or kori, "this;" or "that." Other unexplained forms are found in the verbal inflexions, e.g. d, it, and t, "I;" or "me;" d-akus-t, "it see I;" I see it; d-arrai-t, "it follows me." The demonstratives are used as articles: gaz-en-or, "this younger one;" andre-or, "this lady at some distance." The reflexive self "is" expressed by buru, "head." The relative does not exist, and in its place is used as a kind of verbal participle with the ending n: doa, "he goes;" doana, "he who is going;" in the modern Basque, however, by imitation of French or Spanish, the interrogative zein, soin, is used as a relative. Other interrogatives are nor, "who;" zer, "what;" sembidi, "how much;" &c. But, "one;" batu, "several;" bokatik, "each;" zu, "some one;" hauniz or hainis, "a few;" elkar, "both;" are most common indefinite pronouns. The numeral system is vicesimal; e.g. 34 is hagio to hamalauru, "twenty and fourteen." The numbers from one to ten are: i, bat; 2, bi; 3, hiru; 4, law; 5, hort or host; 6, sei; 7, szap; 8, sortzi; 9, bederatx; 10, hamar; 20, hagio or hogei; 40, herrogi (i.e. twice twenty); 100, ekun. There is no genuine word for a thousand.

The genders in Basque grammar are distinguished only in the verbal forms, in which the sex of the person addressed is indicated by a special suffix; so that etakiti means, "I do not know it;" but to a woman one says also: etakinat. "I do not know it, oh woman!" To a man one says: etakihit (for etakihitak). "I do not know it, oh man!" Moreover, certain dialectic Revues have a respectful form: etakisu, "I do not know it, you respectable one," from which also a childish form is derived, etakichut, "I do not know it, oh child!"

The Basque conjugation appears most complicated, since it incorporates not only the subject pronouns, but, at the same time, the indirect and direct complement. Each transitive form may thus offer twenty-four variations—he gives it!, "he gives it to you,", "he gives them to us," &c., &c. Primitively there were two tenses only, an imperfect and a present, which were distinguished in the transitive verb by the place of the personal subject element: daktigu, "we are knowing it" (gu, i.e. we), and ginkisi, "we were knowing it"; in the intransitive by a nasализation of the radical: nil, "I am;" ninte, "I was.

In modern times a conjunctural future has been derived by adding the suffix ke, daktiet, "I will, shall or probably can know it." No proper moods are known, but subjunctive or conjunctive forms are formed by adding a final n, as dakusat, "I am looking at it;" daksudan, "if I see it." No voices appear to have been used in the same radical, so that there are separate transitive and intransitive verbs.

In its present state Basque only employs its regular conjugation exceptionally; but it has developed, probably under the influence of neo-Latin, a most extensive conjugation by combining a few auxiliary verbs and what may be called participles, in fact declined nouns: ikusten dut, "I have it in seeing," "I see it;" ikusiko dut, "I have it to be seen," "I will see it," &c. The principal auxiliaries are: iaun, "to be;" and ukon, "to have;" but edin, "to can;" eza, "to be able;" egin, "to make;" joan, "to go;" ekoan, "to draw," "to move," are also much used in this manner.

The syntax is simple, the phrases are short and generally the order of words is: subject, complement, verb. The determining element follows the determined: gizon handia, "man great the;" the great man; the genitive, however, precedes the nominative—gizonaren etxea, "the man's house." Composition is common and it has caused several juxtaposed words to be combined and contracted, so that they are partially fused with one another—a process called polysyntheticism; odi, "cloud," is composed of two words odets, "thunder," and odin, "foot," give belaun, "knee," front of the foot. The vocabulary is poor; general and synthetic words are often wanting; but particular terms abound. There is no proper term for "sister," but arreba, a man's sister, is distinguished from ahispa, a woman's sister. We find no original words for abstract ideas, and God is simply "the Lord of the high."

The vocabulary, however, varies extremely from place to place and the dialectic varieties are very numerous. They have been used by Prince L. L. Bonaparte as eight; these may be reduced to three principal groups: the eastern, comprising the Soultaine and the two lower Navarrese; the central formed by the two upper Navarrese, the Guipuzcoan and the Labourdine; and the western, formed by the Biscayan, spoken too in Álava. These names are drawn from the territorial subdivisions, although the dialects do not exactly correspond with them.

Ethnology and Anthropology.—The earliest notices of the geography of Spain, from the 11th century B.C., represent Spain as one country, tribes distinguished more as Iber, Celtiberi and Celts. These had no cohesion together, and were temporarily united against some foreign foe, were at war with one another and were in constant movement; the ruder tribes being driven northwards by the advancing tide of Mediterranean civilization. The tribes in the south in Baetica had, according to Trogus and Strabo, written laws, poems of ancient date and a literature. Of this nothing has reached us. We have only some inscriptions, legends on coins, marks on pottery and on megalithic monuments, in alphabets slightly differing, and belonging to six geographical districts. These still await an interpreter; but they show that a like general language was once spoken through the whole of Spain, and for a short distance on
the northern slope of the Pyrenees. The character of the letters is clearly of Levant origin, but the particular alphabets, to which each may be referred, and their connexion, if any, with the Basques, are still undetermined. It was early remarked by the classical scholars among the Basques after the Renaissance that certain names in the ancient toponymy of Spain, though transcribed by Greek and Latin writers, i.e. by foreigners, ignorant of the language, yet bear a strong resemblance to actual place-names in Basque (e.g. Ilberis, Iriberry); and in a few cases (Mondiculea, Mendigorry; Iru; Oloron) the site itself shows the reason of the name. Andres de Poza (1587), Larramendi (1760), Juan B. Erro (1806) and others had noted some of these facts, but it was W. von Humboldt (1821) who first aroused the attention of Europe to them. This greater extension of a people speaking a language akin to the Basque throughout Spain, and perhaps in Sicily and Sardinia, has been accepted by the majority of students, though some competent Basque scholars deny it; and the certain connexion of the Basques, either with the Iberians or Celtsiberians, whether in race or language, cannot be said to be conclusively proved as long as the so-called Celtiberian inscriptions remain uninterpreted. (See also Iberians.)

After so many centuries of close contact and interpenetration with other peoples, we can hardly expect to find a pure physical type among the present Basques. All that we can expect is to be able to differentiate them from their neighbours. The earliest notice we have of the Basques, by Einhard (778), speaks of their wonderful agility. The next, the pilgrim of the Codex Calixtinus (12th century), says the Basques are fairer in face (facie candidiores) than the Navarrans.

Anthropologists no longer rely solely on craniology, and the measurement of the skull, to distinguish race. The researches of Aranazadi (1880 and 1905) and of Colligon (1889) show them as less fair than northern Europeans, but fairer than any of the southern races; not so tall as the Scandinavians, Teutons or British, but taller than their neighbours of southern races. There is no tendency to prognathism, as in some of the Celts. The profile is often very fine; the carriage is remarkably upright. Neither markedly brachycephalic nor dolichocephalic, the skull has yet certain peculiarities. In the conjunction of the whole physical qualities, says Collignon, there is a Basque type, differing from all those he has known in general and northern Africa. There are differences of type among themselves, yet, when they emigrate to South America, French and Spanish Basques are known simply as Basques, distinct from all other races.

On the origin of the Basques, the chief theories are:—(1) that they are descended from the tribes whom the Greeks and Latins called Iberi; (2) that they belong to some of the foster Berber tribes ("Eurafican," Hervé) and through the ancient Libyans, from a people depicted on the Egyptian monuments; (3) the Atlantic theory, that they belong to a lost Atlantic continent, whose inhabitants were represented by the Guanches of the Canary Islands, and by a fair race on the western coast of Africa; (4) that they are an indigenous race, who have never had any greater extension than their present quarters.

The remains of prehistoric races hitherto discovered in Spain throw little light on the subject, but some skulls found in south-eastern Spain in the age of metal resemble the Basque skulls of Zarautz.

The megalithic remains, the dolmens, menhirs, cromlechs and stone circles are said to resemble more closely those of northern Africa than the larger remains of Britain and of the British Isles. Aristotle tells us that the Iberi fixed obelisks round the tomb of each warrior in number equal to the enemies he had slain (Polit. vii. c. 2. 6), but proof is wanting that these Iberi were Basques.

Iberian inscriptions have been found on the so-called toros de guiando, rude stone bulls or boars, on other monuments of northern Spain and in ancient sepulchres; some of these figures, e.g. at the Cerro de los Santos in Murcia, recall the physical type of the modern Basques, but they are associated with others of very varied types.

Of the religion of the Basques anterior to Christianity, little is certainly known. The few notices we have point to a worship of the elements, the sun, the moon and the morning star, and to a belief in the immortality of the unbaptised and unburied body. The custom of the couvade, attributed by Strabo to the Cantabri, is unknown among the modern Basques. As elsewhere, the Romans assimilated Basque local deities to their own pantheon, thus we find Deo Bascoirto (Baigorry) and Herausartok era in Latin inscriptions. But the name which the Basques themselves give to the Deity is Jaino, Jauagotoko, which may mean lord or master, Lord of the high; but in the dialect of Roncal, Golko means "the moon," and Jauagotoko would mean "lord of the moon." The term Jauin, lord or master, Etecho Jawu, the lord or master of the house, is applied to every householder.

There is no aid to be got from folk-tales; none can be considered exclusively Basque and the literature is altogether too modern. The first book printed in Basque, the Lingua Vasconum Primitiae, the poems of Bernard d'Écheparre, is dated 1545. The work which is considered the standard of the language is the Protestant translation of the New Testament made by Jean de Liagarráte, under the auspices of Jeanne d'Albret, and printed at La Rochelle in 1571. The pastorales are open-air masquerades or masquerade plays in the modern drama of mediaeval ages. They are derived from French materials; but a dancing-chorus, invariably introduced, and other parts of the mise-en-scène, point to possibly earlier traditions. No MS. hitherto discovered is earlier than the 18th century. The greater part of the other literature is religious and translated. It is only recently that a real literature has been attempted in Basque with any success.

In spite of this modernity in literature there are other matters which show how strong the conservatism of the Basques really is. Thus, in dealing with the language, the only true measure of the antiquity of the race, we find that all cutting instruments are of stone; that the week has only three days. There are also other survivals now fast disappearing. Instead of the plough, the Basques used the laya, a two-pronged short-handled steel digging fork, admirably adapted to small properties, where labour is abundant. They alone of the peoples of Western Europe have preserved specimens of almost every class of dance known to primitive races. These are (1) animal (or possibly two-legged) dances, in which men personate animals, the bear, the fox, the hare, &c. (2) sword-dances; (3) the vintage performed with wine-skins; (4) the simple arts, such as weaving, where the dancers, each holding a long coloured ribbon, dance round a pole on which is gradually formed a pattern like a Scotch tartan; (4) war-dances, as the sword-dance and others; (5) religious dances in procession before the Host and before the altar; (6) ceremonial dances in which both sexes take part at the beginning and end of a festival, and to welcome distinguished people. How large a part these played in the life of the people, and the value attached to them, may be seen in the vehement defence of the religious dances by Father Larramendi, S.J., in his Corografía de Guipúzcoa, and by the large sums paid for the privilege of dancing the first Saüt Basque on the stage at the close of a Pastorale.

The old Basque house is the product of a land where stone and timber were almost equally abundant. The front-work is of wood with carved beams; the balconies and huge over-hanging roof recall the Swiss chalet, but the side and back walls are of stone often heavily buttressed. The castle occupy the ground-floor, and the first storey is reached often by an outside staircase. The carved tombs with their ornaments resemble those of Celtic countries, and are found also at Bologna in Italy.

In customs, in institutions, in administration, in civil and political life there is no one thing that we can say is peculiarly and exclusively Basque; but their whole system taken together marks them off from other people and especially from their neighbours.

Character.—The most marked features in the Basque character are an intense self-respect, a pride of race and an obstinate conservatism. Much has been written in ridicule of the claim of all Basques to be noble, but it was a fact both in the laws of
Spain, in the fueros and in practice. Every Basque freeholder (sectino) could prove himself noble and thus eligible to any office. They are not a town race; a Basque village consists of a few houses; the population lives in scattered habitations. They do not feel solitude, and this makes them excellent emigrants and missionaries. They are splendid seamen, and were early renowned as whale fishermen in the Bay of Biscay. They were the first to establish the cod-fishery off the coast of Newfoundland. They took their full part in the colonization of America. Basque names abound in the older colonial families, and Basque newspapers have been published in Buenos-Aires and in Los Angeles, California. As soldiers they are splendid marksmen; they retain the tenacity and power of endurance which the Romans remarked in the Iberians and Celtiberians. They are better in defence than in attack. The failure to take Bilbao was the turning-point in both Carlist wars. In civil institutions and in the tenures of property the legal position of women was very high. The eldest born, whether boy or girl, inherited the ancestral property, and this not only among the higher classes but among the peasantry also. In the fueros an insult done to a woman, or in the presence of a woman, is punished more severely than a similar offence among men. This did not work as hard as, or even harder than, the men. All authors speak of the robust appearance of the women-rowers on the Bidassoa, and of those who loaded and unloaded the ships in Bilbao.

Institutions.—In their municipal institutions they kept the old Roman term respublica for the civitas and the territory belonging to it. All municipal officers were elective in some form or other, and there is hardly any mode of election, from universal suffrage to nomination by a single person chosen by lot, that the Basques have not tried. The municipalities sent deputies to the juntas or parliaments of each province. These assemblies took place originally in the open air, as in other parts of the Pyrenees, under trees, the most celebrated of which is the oak of Guernica in Biscay, or under copies, as the Bilzaar in the French Pays Basque. The cortes of Navarre met at Pamplona. Delegates from the juntas met annually to consider the common interests of the three provinces. Besides the separate municipalities and the juntas, there were often associations and assemblies of three or five towns, or of three or four vassals, to preserve the special privileges or for the special needs of each. Hence was formed a habit of self-government, the practice of legislative, judicial and administrative functions, which resulted gradually in a code of written or unwritten laws embodied in the fueros or jors of each province, and the cortas-pueblos of the towns. In form these fueros or charters are often grants from the lord or sovereign; in reality they are only a confirmation or codification of unwritten customary laws in practice among the people, the origin of which is lost in antiquity. The kings of Castile, of Spain and of Navarre were obliged at their accession, either in person, or by deputy, to swear to observe these fueros; and this oath was really kept. While the cortes were tramped upon and absolutism reigned both in Spain and in France, the Basque fueros were respected; in Spain to the middle of the 19th century and in France down to the Revolution. The fueros thus observed made the Basque provinces a land apart (una tierra apartada), a self-governing republic (una verdadera autonomia), under an absolute monarchy, to which, however, they were always loyal. And this independence was acknowledged, not only in local, but also in international and European treaties, as in art. 14 of the treaty of Utrecht 1713. So the act of the 3rd of June 1876, which assimilated the Basque Provinces to the rest of Spain, acknowledged the true self-government which they had enjoyed for centuries.

The circumstances and methods which enabled the Basques to preserve this independence were, first, the isolation caused by their peculiar language; next, the mountainous and easily-defended nature of the country, its comparative poverty and the possession of a sea-board. Then there were the rights and the safeguards which the fueros themselves gave against encroachments. The rights were:—freedom of election to all offices and to the juntas; exemption from all forced military service except for the defence of the country and under their own officers; and payment beforehand exacted for all service beyond their own frontiers (this did not of course exclude voluntary service of individuals in the Spanish or French armies). Then there was free trade with foreign nations, and especially between the Basques of both nations. The customs' frontier of Spain really began on the Ebro. Then no decree or sentence of the royal authorities could have effect in the provinces except countersigned by the junta. Otherwise the resisting and even the killing of a royal officer was no murder. But chiefest of all the safeguards was the provision that no tax or contribution should be levied or paid to the crown till all petitions had been heard and wrongs redressed; that such a vote should be the last act of the junta or cortes, and the money should be paid not as a demand of right or a tax, but as a free gift and above all a voluntary one. It was paid in a lump sum, and the repartition and levying were left entirely in the hands of the junta and the municipalities.

As a further precaution against the inroads of absolutism, no lawyer was allowed to be a deputy to the junta and all clergy were likewise excluded. The Basques considered that men of these professions should always be on the side of tyranny. One lawyer (letrado) was present at the juntas for consultation on the points of law, but he was not allowed to vote. So strictly was this observed that after the battle of Vitoria in 1813, when it was difficult to get together a quorum for the reorganization of the country, the letrado, though one of the most active and influential members in consultation, was not allowed to vote.

The relations between Church and State among the Basques have been very remarkable. They are a highly religious people, eminently conservative in their religious practices. In religion alone, through Ignatius de Loyola of Guipuzcoa and Francis Xavier of Navarre, they have left their mark upon Europe. They have kept the earliest form of Christian marriage and of the primitive order of deaconesses, forgotten elsewhere in the West. The feast of Corpus Christi instituted by Pope Urban IV. (1264) still appears in Basque almanacs as Phesta-berria, the New Feast. The earliest notice that we have of them speaks of their liberality to the clergy; yet with all this religious conservatism they have never allowed themselves to be priest-ridden. They constantly resisted the attempts of the crown to force upon them the authority of the Spanish bishops. When Ferdinand the Catholic came to Biscay in 1477 to swear to the fueros, he was compelled to send back the bishop of Pamplona whom he had brought with him. No strange priest could enter the town when the junta was sitting, and in some places if a deputy were seen speaking to a priest before a session he lost his vote for that day. The bishops had no share in ecclesiastical patronage in Guipuzcoa; all was in the hands of the king, of the nobles or of the municipalities, else the priests were chosen by competitive examination or elected by the people. They would not allow the priest to interfere with the games or dances, and when the drama was forbidden in all Spain in 1757 by the authority of the Spanish bishops, the cortes of Navarre compelled the king to withdraw the order.

For a stronger coming from lands of larger farms and apparently higher cultivation, the agriculture of the Basques seems poor, but the old scattered homesteads show a sense of security that has been lacking in some parts of Spain; and the Basques have shown great adaptability in suiting their agriculture to new conditions, helped by the presence of the courts at San Sebastian and Biarritz. When the old self-sufficient village industries declined, in consequence of the invention of machinery and manufacture elsewhere, the Basques entered at once upon emigration to the agricultural parts of the Americas, and the result has been that the Basque Provinces and the Pays Basque probably have never been more prosperous than they are now, and perhaps a new Eskual-herria and a new Eskua are being built up in the distant lands to which they are such valued immigrants.

BIBLIOGRAPHY.—For so restricted a literature the Essai d'une bibliographie de la langue basque, by Julien Vinson (Paris, 1891), with the volume of additions and corrections, 1898, is practically exhaustive, and is a mine of information on the principal works. See also for the language, A. Ohlenart, Notitia utriusque Vasconiae (Paris, 1638 and 1650), 4to., ch. xiv.; Fl. Lecluse, Manuel de la
The capital of the vilayet, also called Basra, is situated in 40° 34' E. long. and 32° N. lat., near the western bank of the Shatt el-Arab, about 55 m. from the Persian Gulf. The town proper lies on the canal el-'Assar about 1½ to 2 m. W. of the Shatt el-Arab. There are no public buildings of importance. The houses are meanly built, partly of sun-dried and partly of burnt bricks, with flat roofs surrounded by parapets. The bazaars are miserable structures, covered with mats laid on rafters of date trees. The streets are irregular, narrow and unpaved. The greater part of the area of the town is occupied by gardens and plantations of palm-trees, intersected by a number of little canals, cleansed twice daily with the ebb and flow of the tide, which rises here about 6 ft. These canals are navigated by small boats, called bellem (plur. ablam), resembling dug-outs in form, but light and graceful. At high-tide, accordingly, the town presents a very attractive appearance, but at low-tide, when the mud banks are exposed, it seems dirty and repulsive, and the noxious exhalations are extremely trying. The whole region is subject to inundations. The town itself is unhealthy and strangers especially are apt to be attacked by fever. Basra is the port of Bagdad, with which it has steam communication by an English line of river steamers weekly and also by a Turkish line. The Shatt el-Arab is deep and broad, easily navigable for ocean steamers, and there is weekly communication by passenger steamer with India, while two or more freight lines, which also take passengers, connect Basra directly with the Mediterranean, and with European and British ports. It is the great date port of the world, and the dates of Basra are regarded as the finest in the market. Besides dates the principal articles of export are wool, horses, liquorice, gum and carat of roses. The annual value of the exports is approximately £1,000,000, and of the imports a little more. The foreign trade is almost exclusively in the hands of the English, but of late the Germans have begun to enter the market. The Hamburg-American line of steamers has established direct communication. Since 1856 the town has been a British consul at Basra (before that time he was a representative of the Indian government). France and Russia also maintain consular establishments at Basra. The settled population of Basra is probably under 50,000, but how much it is impossible to estimate. It is a heterogeneous mixture of all the nations and religions of the East—Turks, Arabs, Persians, Indians, Armenians, Chaldeans and Jews. Of the latter there are about 1900, engaged in trade and commerce. Fewest in number are the Turks, comprising only the officials. Most numerous are the Arabs, chiefly Shi'ites. The wealthiest and most influential personage in the capital and the vilayet is the nakkib, or marshal of the nobility (i.e. descendants of the family of the prophet, who are entitled to wear the green turban). Basra is a station of the Arabian mission of the Dutch Reformed Church of America. History.—The original city of Basra was founded by the caliph Omar in A.D. 636 about 8 m. S.W. of its present site, on the ruins of the ancient and populous Arabian plateau, on an ancient canal now dry. The modern town of Zobeir, a sort of health suburb, occupied by the villas of well-to-do inhabitants of Basra, lies near the ruin mounds which mark the situation of the ancient city. In the days of its prosperity it rivalled Kufa and Wasit in wealth and size, and its fame is in the tales of the Arabian Nights. With the decay of the power of the Abbasid caliphate its importance declined. The canals were neglected, communication with the Persian Gulf was cut off and finally the place was abandoned altogether. The present city was conquered by the Turks in 1668, and since that period has been the scene of many revolutions. It was taken in 1777 after a siege of eight months by the Persians under Sadik Khan. In about a year it fell again into the hands of the Turks, who were again deprived of it by the sheikh of the Montefik (Montafiq) Arabs. The town was in the October following recovered by Sulaiman Pasha, who encountered the sheikh on the banks of the Euphrates and put him to flight; it has since remained in the hands of the Turks. (C.L.)

BASS, the name of a family of English brewers. The founder of the firm, William Bass (b. 1726), was originally a carrier, one of his chief clients being Benjamin Pifton, a Burton-on-Trent brewer. By 1777 Bass had saved a little money, and seeing the growing demand for Burton beer he started as a brewer himself. The principal market for Burton beer at that time was in St Petersburg, whither the beer could be sent by water direct from Burton via the Trent and Hull, and William Bass managed to secure a tolerable share of the large Russian orders. But in 1822 the Russian government placed a prohibitory duty on Burton ales, and the Burton brewers were forced into cultivating the home market. William Bass opened up a connexion with London, and established a fairly profitable home trade. A misunderstanding between the East India Company and the London brewers who were the proprietors of Hodgson's India
Pale Ale, at that time the standard drink of Englishmen in the East, resulted in Bass being asked to supply a beer which would withstand the Indian climate and be generally suitable to the Indian market. After a series of experiments he produced what is still known as Bass's pale ale. This new and lighter beer at once became popular all over India, and Bass's firm became the largest in Burton. After William Bass's death the business was carried on by his son, M. T. Bass, and then by his grandson, Michael Thomas Bass (1799–1884). In 1827 a vessel laden with Bass's beer was wrecked in the Irish Channel. A large proportion of the cargo was however salvaged and sold at Liverpool, where it met with great approval in the local market, and through this chance circumstance the firm opened up a regular trade in the north-west of England and Ireland. “Bass” was, however, little drunk in London till 1831, when it was supplied on draught at the Exhibition of that year, since which time its reputation has been world-wide. In 1880 the business was turned into a limited liability company. Michael Thomas Bass, besides actively conducting and extending the firm's operations, was a man of great public spirit and philanthropy, and the towns of Burton and Derby are greatly indebted to his munificence. He took a keen interest in all questions affecting the welfare of the working classes, and was largely instrumental in securing the abolition of imprisonment for debt. On his death, prior to which he had taken into partnership Messrs Ratcliff and Gretton, two of the leading officials of the brewery, converting the business into a limited company known as Messrs Bass, Ratcliff & Gretton, Ltd., the control of the firm passed to his sons, Michael Arthur Bass and Hamar Bass (d. 1898). Michael Arthur Bass (1837–1900), after twenty-one years in parliament as member first for Stafford, then for two divisions of Staffordshire, was in 1886 raised to the peerage as Baron Burton; by a special patent of 1897 the peerage descended to his daughter, Nellie, the wife of Mr. J. E. Baillie of Dochfour, the baronetcy descending to his nephew W. A. Hamar Bass (b. 1879).

BASS (the same word as "base," and so pronounced, but influenced in spelling by the Ita. basso, deep, low; especially in music, the lower part in the harmony of a composition, the lowest male voice, or the lowest-pitched of a class of instruments, as the bass-clarinet.

Bass or bast (a word of doubtful origin, pronounced bät) is the fibrous bark of the lime tree, used in gardening for tying up plants, or to make mats, soft plaited baskets, &c. Basswood is the American lime-tree, *Tilia Americana*; white basswood is *T. heterophylla*.

The name bass is also given to a fish closely resembling the perch.

**BASSA,** a province of the British protectorate of Northern Nigeria, occupying the angle made by the meeting of the Benue river with the Niger. It has an area of 7000 sq. m., with a population estimated at about one and a half millions. It is bounded N. by the Benue, W. by the Niger, S. by the frontier of Southern Nigeria, and E. by the province of Muri. The province is heavily forested, and is estimated to be one of the richest of the protectorate in natural products. It has never been penetrated by Moslem influence, and is disputed in the greater part by the hatchets of pagan warlike tribes. Early in the 17th century the Igbira (Okpoto or Ibo) were one of the most powerful pagan peoples of Nigeria and had their capital at Iddah. At a later period the Bassas conquered the western portion of the state and the Munshis the eastern, while the Okpoto still held the south and a wedge-shaped district partially dividing the Munshis and Bassas. The Bassas are a very remarkable pagan race who permeate the entire protectorate of Northern Nigeria, and are to be found in small colonies in almost every province. They are clever agriculturists, naturally peaceful and industrious. The Munshis, though also good agriculturists, are a warlike and most unruly race, as are also the Okpoto.

The districts which now comprise the province of Bassa nominally under British control in 1906, but up to the year 1905 administrative authority was confined to the western half with *Okpoto* (in N 9° 3' E., 7° 41' N.) for its capital. In December of 1903 a disturbance resulting in the murder of the British resident led to the despatch of a military expedition, and as a result of the operations the frontiers of the districts under control were extended to the borders of the Munshi country in about 8° E.

The western portion of the province, occupied by friendly and peaceful tribes upon the Niger, has been organized for administration on the same system as the rest of the protectorate. Courts of justice are operative and taxes are peacefully collected. The Okpoto, however, remain turbulent, as do their neighbours the Munshis. Spirits, of which the importation is forbidden in Northern Nigeria, are freely smuggled over the border from Southern Nigeria. Arms and powder are also imported. The slave-trade is still alive in this district, and an overland route for slaves is believed to have been established through eastern Bassa to the Benue. In consequence of the natural wealth of the province, there are trading establishments of the Niger Company and of Messrs Holt on the Niger and Benue, and colonies of native traders have penetrated the country from the north. Roman Catholic and Protestant missions are established at Dekina and Gibebe.

**BASSANO,** a city of Venetia, Italy, in the province of Vicenza, 24 m. N.E. of Vicenza and 30 m. N. of Padua by rail, at the foot of the Venetian Alps. Pop. (1901) town, 7533; commune, 15,097. It is well situated upon the Brenta, which is here spanned by a covered wooden bridge, and commands fine views. The castle, erected by the Ezzelini in the 13th century, lies in the upper portion of the town, above the river; a tower, erected by a member of the same family, is a conspicuous feature. The museum and cathedral and some of the other churches contain pictures by the da Ponte family (16th and early 17th century), surmounted Bassano from their birth-place; Jacopo is the most eminent of them. The museum also contains drawings and letters of the sculptor Antonio Canova. S. Francesco, begun in the 12th century in the Lombard Romanesque style, was continued in the 13th in the Gothic style. Some of the houses have traces of paintings on their façades. In the 11th century Eccelin, a German, obtained fees in this district from Conrad II. and founded the family of the Ezzelini, who were prominent in the history of North Italy in the 13th and 14th centuries. Bassano apparently came into existence about A.D. 1000. Its possession was disputed between Padua and Vicenza; it passed for a moment under the power of Gian Galeazzo Visconti of Milan, who fortified it. At the beginning of the 15th century it went over to Venice; its industries flourished under Venetian government, especially its printing-press and manufacture of majolica, the latter of which still continues. On the 8th of September 1796 an action was fought here between the French and the Austrians, in which the French were victorious. (T. As.)

**BASSARAB** or **BASSARABA,** the name of a dynasty in Rumania, which ruled Walachia from the dawn of its history until 1658.
The origin of the name and family has not yet been explained. It undoubtedly stands in close connexion with the name of the province of Bessarabia, which Oriental chroniclers gave in older times to the whole of Walachia. The heraldic sign, three heads of negroes in the Bassarab shield, seems to be of late western origin and to rest on a popular etymology connecting the second half of the word with Arabs, who were taken to signify Moors (blacks). The other heraldic signs, the crescent and the star, have evidently been added on the same supposition of an oriental origin of the family. The Servian chroniclers connect its origin with their own nationality, basing this view upon the identification of Samb with Sorb or Serbia. All this is mere conjecture. It is, however, a fact that the first appearance of the Bassarabs as rulers (kinys, ban or voivod) is in the western part of Rumania (originally called Little Walachia), and also in the southern parts of Transylvania—the old dukedoms of Fagarash and Almas, which are situated on the right bank of the Olt (Aluta) and extend south to Severin and Craiova.

Whatever the origin of the Bassarabs may be, the foundation of the Walachian principality is undoubtedly connected with a member of that family, who, according to tradition, came from Transylvania and settled first in Câmpulung and Târgoviștea. It is equally certain that almost every one of the long line of princes and voivods bore a Slavonic surname, perhaps due to the influence of the Slavonic Church, to which the Rumanians belonged. Starting from the 13th century the Bassarabs split into two rival families known in history as the descendants of the two brothers Dan and Dragul. The form Drakul—by which this line is known in history is no doubt a nickname given by the rival line. It has fastened on the family on account of the cruelties perpetrated by Vlad Drakul (1433-1446) and Vlad Tepesh (1445-1476), who figure in popular legend as representatives of the most fiendish cruelty. The feud between the rival dynasties lasted from the beginning of the 15th century to the beginning of the 17th.

The most prominent members of the family were Mircea (1386-1418), who accepted Turkish suzerainty; Neagoe, the founder of the famous cathedral of Curtea de Argeș (q.v.); Michael, surnamed the Brave (1592-1601); and Petru Cercel, famous for his profound learning, who spoke twelve languages and carried on friendly correspondence with the greater scholars and poets of Italy. He was drowned by the Turks in Constantinople in 1590 through the intrigues of Miînea, who succeeded him on the throne of Walachia. The British Museum possesses the oldest MSS. of the Rumanian Gospels, once owned by this Petru Cercel, and containing his autograph signature. The text was published by Dr. M. Gaster and the experiments of the Rumanian governor Mătăiu Bassarab (1643-1654) established the first printing-press in Rumania, and under his influence the first code of laws was compiled and published in Bucharest in 1654. The Bassarab dynasty became extinct with Constantin Şerban in 1658. See Rumania: Language and Literature. (M. G.)

**BASS CLARINET**

(Fr. clarinette basses; Ger. Bass-Klarinette; Ital. clarinetto basso o clarone), practically the A, B♭ or C clarinet speaking an octave lower; what therefore has been said concerning the fingering, transposition, acoustical properties and general history of the clarinet (q.v.) also applies to the bass clarinet. Owing to its greater length the form of the bass clarinet differs from that of the clarinet in that the bell joint is bent up in front of the instrument, terminating in a large gloxinia-shaped bell, and that the mouthpiece is attached by means of a strong ligature and screws to a serpent-shaped crook of brass or silver. The compass of the modern orchestral bass clarinet is in the main the same as that of the higher clarinets in C, B♭ and A, but an octave lower, and therefore for the bass clarinet in C is

\[ \text{\textintext{C}} \]  

for the bass clarinet in B♭ the real sounds are one tone, and for the bass clarinet in A a tone lower, although the notation is the same for all three.

Sometimes the treble clef is used in notation for the bass clarinet. It must then be understood that the instrument in C speaks an octave lower, the bass clarinet in B♭ a major ninth and the bass clarinet in A a minor tenth lower. The tenor clef is also frequently used in orchestral works.

The quality of tone is less roundy in the bass clarinet than in the higher instruments. It resembles the bourdon stop on the organ, and in the lowest register, more especially, the tone is somewhat hollow and wanting in power although mellower than that of the bassoon. In the lowest octave the instrument speaks slowly and is chiefly used for sustained bass or melody notes; rapid passages are impossible.

The modern orchestral model may be fitted with almost every kind of key-mechanism, including the Boehm, and the degree of perfection and ingenuity attained has removed the all but insuperable difficulties which stood in the way of the original inventors who, not understanding key-work, made many futile attempts to bridge the necessarily great distance between the finger-holes by making the bore serpentine, boring the holes obliquely, &c.

The low pitch of the bass clarinet (8 ft. tone) contrasted with the moderate length of the instrument—whose bore measures only some 42 to 43 inches from mouthpiece to bell, whereas that of the bassoon, an instrument of the same pitch, is twice that length—is a puzzle to many. An explanation of the fact is to be found in the peculiar acoustical properties of the cylindrical tube played by means of a reed mouthpiece characterizing the clarinet family, which acts as a closed pipe speaking an octave lower than an open pipe of the same length, and overblowing a twelfth instead of an octave. This is more fully explained in the articles CLARINET and AULOS.

The construction of the bass clarinet demands the greatest care. The bore should theoretically be strictly cylindrical throughout its length from mouthpiece to bell joint; the slightest deviation from mathematical accuracy, such as an undue widening of the bell from the point where it joins the body to the mouth of the bell, would tend to muffle the lower notes of the instrument and to destroy correct intonation.

The origin of the bass clarinet must be sought in Germany, where Heinrich Grenser of Dresden, one of the most famous instrument-makers of his day, made the first bass clarinet in 1793. The basset horn (q.v.) or tenor clarinet, which had reached the height of its popularity, no doubt suggested to Grenser, who was more especially renowned for his excellent fagottos, the possibility of providing for the clarinet a bass of its own. One of these earliest attempts in the form of a fagotto, stamped "A. Grenser, Dresden," with nine square-flapped brass keys working on knobs, is in the Grossherzogliches Museum at Darmstadt, and was given to the Royal Military Exhibition, London 1890. Two other early specimens, belonging originally to Adolphe Sax and to M. de Cuissommaker, are now respectively preserved in the museums of the Brussels Conservatoire and of the Berlin Hochschule (Sneck Collection). The tubes are of great thickness and the holes are bored obliquely through the walls. Both instruments are in A.

Attempts were made in Italy to overcome the mechanical difficulties by making the bore of the bass clarinet serpentine. A specimen by Nicola Papalini of Pavia in the museum of the Brussels Conservatoire has the serpentine bore pierced through two slabs of pear-wood; the two halves, each forming a vertical section of the instrument, are fitted together with wooden pins. The outside length is only 2 ft. 3½ in. and there are nineteen finger-holes.

Joseph Ulhmann of Vienna constructed a bass clarinet, also termed "bass basset horn," with twenty-three keys and a compass from B♭ through four complete octaves with all chromatic

---

4 See Dr. Schafhautl's report on the Munich exhibition, Bericht der Verleihungskommission für Musikinstrumente (Munich, 1885), p. 153.
semitones. These instruments resemble the saxophones (q.v.), having the bell joint bent up in front and the crook almost at right angles backwards, but the bore of the saxophone is conical.

Georg Streitwolf (1779-1837), an ingenious musical instrument-maker of Göttingen, produced in 1828 a bass clarinet with a compass extending from Ab to F, nineteen keys and a fingering the same as that of the clarinet with but few exceptions. In form it resembled the fagotto and had a crook terminating in a beak mouthpiece. The Streitwolf bass clarinet was adopted in 1834 by the Prussian infantry as bass to the wood-wind.1 Streitwolf’s first bass clarinets were in C, but later he constructed instruments in B♭ as well. Like the basset horn, Streitwolf’s instruments had the four chromatic open keys extending the compass downwards to B♭. The tone was of very fine quality. One of these instruments is in the possession of Herr C. Krause of Erfurt,2 and another is preserved in the Berlin collection at the Hochschule.

It was, however, the successive improvements of Adolphe Sax (Paris, 1814-1894), working probably from Grenier’s and later from Streitwolf’s models, which produced the modern bass clarinet, and following up the work of Halary and Buffet in the same field, he secured its introduction into the orchestra at the opera. The bass clarinet in C made its first appearance in opera in 1856 in Meyerbeer’s ‘Huguenots,’ Act V, where in a fine passage the lower register of the instrument is displayed to advantage, and later in ‘Dinorah (Le pardon de Ploermel).’ Two years later (1858) at the theatre of Modena a bass clarinet by P. Maimo of Milan, differing in construction from the Sax model, was independently introduced into the orchestra.3 Wagner employed the bass clarinet in B♭ and in C in ‘Tristan und Isolde,’ where at the end of Act II, it is used with great effect to characterize the reproachful utterance of King Mark, thus:

(Bass clarinet)

\[
\text{K. S.}
\]

**BASEIN, a district and town in the Irrawaddy division of Lower Burma, in the delta of the Irrawaddy. The district has been reduced to 4127 sq. m., from 8054 sq. m. in 1871, having given up a large tract to the district of Myanmya formed in 1856.**

A mountain range called the Ana-puk Taungmyin stretches through the district from N. to S. along the coast. The principal river of the district is the Irrawaddy, which debouches on the sea at its eastern extremity through a delta intersected with salt water creeks, among which the Pyamalaw, Pyinazul, Kuynto, and Ngewun Shaggyi or Bassin river rank as important arms of the sea. Irrawaddy and Inyegyi are the only two lakes in the district. The delta of the Irrawaddy forms, wherever cultivated, a vast sheet of rice, with cotton, sesameum, and tobacco as subsidiary crops. In 1901 the population was 391,427.

**BASEIN, the chief town and port, is the capital of the district and division, and is situated on the eastern bank of the Basein river, one of the main arteries by which the waters of the Irrawaddy discharge themselves into the sea.** It forms an important seat of the rice trade with several steam rice mills, and has great capabilities both from a mercantile and a military point of view, as it commands the great outlet of the Irrawaddy. It fell before the British arms, in May 1852, during the second Burmese war. In 1901 it had a population of 31,864. The vessels of the Irrawaddy Flotilla Company ply between Rangoon and Basein, &c., by inland waters, and a railway opened in 1903 runs north-eastward through the centre of the district, to Henaeda and Letpadan.

**BASSELIN, OLIVIER (c. 1400-1450), French poet, was born in the Val-de-Vire in Normandy about the end of the 14th century. He was by occupation a fuller, and tradition still points out the site of his mill. His drinking songs became famous under the name of Vaux-de-Vire, corrupted in modern times into ‘vaudevill.”** From various traditions it may be gathered that Basselin was

1 See *Allgemeine musikalische Zeitung* (Leipzig, 1834), Bd. xxxvi, March, p. 193.
3 See W. Altenburg, op. cit. p. 34.
4 Orchestral score, p. 284.
follows the crest-line of the main range. Forts guard the upper valleys of the Nive and the Aspe, along which run important passes into Spain. The general direction of the rivers of the department is towards the north-west. The streams almost all meet in the Adour through the Gave de Pau, the Bidouze, and the Nive. In the north-east the two Luys flow directly to the Adour, which they join in Landes. In the south-west the Nivelle and the Bidassoa flow directly into the sea. The lower course of the Adour forms the boundary between Basses-Pyrénées and Landes; it enters the sea a short distance below Bayonne over a shifting bar, which has often altered the position of its mouth. The Gave de Pau, a larger stream than the Adour, passes Pau and Orthez, but its current is so swift that it is only navigable for a few miles above its junction with the Adour. On the left it receives the Gave d'Oloron, formed by the Gave d'Ossau, descending from the Pic du Midi, and the Gave d'Aspe, which rises in Spain. An important affluent of the Gave d'Oloron is the Saison or Gave de Mauléon, descends from the Pic d'Orhy. From the Pic des Escaliers, which rises above the forest of Iraty, the Bidouze descends northwards, while the forests of the region situated on the southern slope of the chain, forms a part of French territory. The Nive, a beautiful river of the Basque country, takes its rise in Spain; after flowing past St Jean-Pied-de-Port, formerly capital of French Navarre and fortified by Vauban to guard the pass of Roncevaux, it joins the Adour at Bayonne. The Nivelle also belongs partly to France and ends its course at St Jean-de-Luz. The Bidassoa, which is only important as forming part of the frontier, contains the Île des Faisans, where the treaty of the Pyrenees was concluded (1659), and debouches between Hendaye (France) and Fuenterribia (Spain).

The climate of the department is mild and it has an abundant rainfall, partly due to the west wind which drives the clouds from the gulf of Gascony. The spring is rainy; the best seasons are summer and autumn, the heat of summer being moderated by the sea. The winters are mild. The air of Pau agrees with invalids and delicate constitutions, and St Jean-de-Luz and Biarritz are much frequented by winter visitors.

Despite extensive tracts of uncultivated land, the department is mainly agricultural. Maize and wheat are the chief cereals; potatoes, flax and vegetables are also produced. Pasture is abundant, and horses, cattle, sheep and pigs are largely reared. The vine is grown on the lower slopes sheltered from the north wind, the wines of Jurançon, near Pau, being the most renowned. Of the fruits grown, chestnuts, cider-apples, and pears are most important. About one-thirtieth of the department consists of woods, a very small proportion of which belong to the government, the rest to the communes and private individuals.

The department furnishes salt, building-stone, and other quarry products. There are mineral springs at Eaux-Bonnes, Eaux-Chaudes, Cambo-les-Bains (resorted to by the Basques on St John's Eve), St Christau, and Salies. At Le Boucau, 3 m. from Bayonne, there are large metallurgical works, the Forges de l'Adour, and chemical works. The manufacture of the department includes woolen and cotton goods, cord slippers, chocolate, paper, and there are also tanneries, saw and flour-mills.

"Bayonne hams" and other table delicacies are prepared at Orthez. There is a considerable fishing population at Bayonne and St Jean-de-Luz. Bayonne is the principal port. Exports consist chiefly of timber, mine-props, minerals, wine, salt and resinous products. Coal, minerals, phosphates, grain and wool are leading imports. The interior commerce of the department is, however, of greater importance to its inhabitants; it takes the form of exchange of products between the regions of mountain and plain. The railway lines of Basses-Pyrénées, the chief of which is that from Bayonne to Toulouse via Orthez and Pau, belong to the Southern Company. The Adour, the Nive and the Bidouze are navigable on their lower courses. The department has five arrondissements—Pau, Bayonne, Oloron, Orthez and Mauléon, divided into 41 cantons and 559 communes. It constitutes the diocese of Bayonne, comes within the educational circumscription (académie) of Bordeaux and belongs to the district of the XVIII army corps. Pau, the capital and seat of a court of appeal, Bayonne, Oloron, Biarritz, Orthez, Eaux-Bonnes, and St Jean-de-Luz are the principal towns. The following places are also of interest:—Lescar, which has a church of the 12th and 16th century, once a cathedral; Montagne, with a stronghold built in 1380 by Gaston Phoebus, count of Foix and viscount of Béarn; and Sauveterre, a town finely situated on the Gave d'Oloron, with an old bridge, remains of a feudal castle, and a church in the Romanesque and Gothic styles.

**BASSET** or **Bassette**, a French game of cards played by five persons with a pack of fifty-two cards. Once very popular, it is now practically obsolete. It is said to be of Venetian origin and to have been introduced into France by Justiniani, the ambassador of Venice in the second half of the 17th century. It resembles lansquenet (q.v.) in a general way, in that it is played between a banker and several punters, the players winning or losing according as cards turned up match those already exposed or not.

**BASSET HORN** (Fr. Cor de Basset, or Cor de Bassette; Ger. Bassethorn, Basshorn; Ital. Corno di Bassetto), a wood-wind instrument, not a "horn," member of the clarinet family, of which it is the tenor. The basset horn consists of a nearly cylindrical tube of wood (generally cocus or box-wood), having a cylindrical bore and terminating in a metal bell wider than that of the clarinet. For convenience in reaching the keys and holes, the modern instrument is usually bent or curved either near the mouthpiece or at the bell, which is turned upwards. The older models were bent in the middle at an obtuse angle, and had at the bottom of the lower joint, near the bell, a wooden block, inside which the bore was reflected, and bent down upon itself. The basset horn has the same fingering as the clarinet, and corresponds to the tenor of that instrument, being pitched a fifth below the clarinet in C. The alto clarinet in Eb is often substituted for the basset horn, especially in military bands, but the instruments differ in three particulars:—(1) The basset horn has a metal bell instead of the pear-shaped contracted bell of the alto clarinet. (2) The bore of the basset horn is wider than that of the alto clarinet in Eb, or of the tenor clarinet in F. (3) The tube of the basset horn is longer than that of the clarinet, and contains four additional long keys, worked by the thumb of the right hand, which in the clarinet is only used to steady the instrument. These keys give the basset horn an extended compass of two tones downwards to F and the F clarinet to.

![Fig. 1.](From photographs lent by M. Victor Mahillon.)

A (actual sounds). This brings the compass of the basset horn to a range of four octaves from
Like the clarinet, the basset horn is a transposing instrument, its music being written a fifth higher than the actual sounds. The treble clef is used in notation for all but the lowest notes. The technical capabilities of the basset horn are the same as for the clarinet, except that the extra low notes from A to F (actual sounds) can only be intoned slowly and staccato; the notes of the upper register better represented in the clarinet are seldom used in orchestral music.

The tone of the basset horn is extremely reedy and rich, especially in the medium and low registers; the tone colour is similar to that of the clarinet without its brilliancy; it is mellow and sensuous, but slightly sombre, and therefore well adapted for music of an elegiac funereal character.

The basset horn flourished mainly in Germany, where at the end of the 18th century it was the favourite solo instrument of many celebrated instrumentalists, such as Czerny, David, Lotz, Springer, &c. Among the great masters, Mozart seems to have been foremost in his appreciation of this beautiful instrument. In his Requiem, the reed family is represented by two basset horns having independent parts, and two bassoons. Mozart has also used the instrument with great effect in his opera La Clemenza di Tito, where he has written a fine obbligato for it in the closing scene, “Non piu di Flori”; in Zasberflute; and in chamber music, viz. short adagio for two basset horns and bassoon, and another for two clarinets and three basset horns (Series 10 of Breitkopf & Härtel's complete edition). Beethoven employed it in his Prometheus overture. Mendelssohn used it in military music, and in two concerted pieces for clarinet and basset horn with pianoforte accompaniment, in F and D min., opp. 113 and 114, dedicated to Heinrich and Carl Bärmann.

The archetypes of the basset horn are the same as those of the clarinet (q.v.). The basset horn was the outcome of the desire, prevailing during the 16th and 17th centuries, to obtain complete families of instruments to play in concert. The invention of the basset horn in 1770 is attributed to a clarinet maker of Passau, named Horn, whose name was given to the instrument; by a misnomer, the basset horn became known in Italy as corno di bassotto, and in France as cor de basset. In 1782, Theodore Lotz of Pressburg made some modifications in the instrument, which was further improved by two instrumentalists of Vienna, Anton and Johann Stadler. Lotz's alterations were condensed in 1800 by Iwan Mueller, a famous clarinettist, who invented the alto clarinet in Eb from the basset horn, by giving the latter a construction and fingering analogous to those of the clarinet in B♭, which he took as his model, instead of the clarinet in C.

BASSI, LAURA MARIA CATERINA (1771-1778), an Italian lady eminently distinguished for her learning, was born at Bologna in 1771. On account of her extraordinary attainments she received a doctor's degree, and was appointed professor in the philosophical college, where she delivered public lectures on experimental philosophy till the time of her death. She was elected member of many literary societies and carried on an extensive correspondence with the most eminent European men of letters. She was well acquainted with classical literature, as well as that of France and Italy. In 1738 she married Giuseppe Verrati, a physician, and left several children. She died in 1778.

1 Cantor Lectures on Musical Instruments, their Construction and Capabilities, by A. J. Hipkins, p. 15; Henri Lavoix, Histoire de l'instrumentation depuis le sixième siècle jusqu'à nos jours (Paris, 1878), on p. 123 the date is given as 1777.
